PICRIC ACID may be precipitated from waste liquors by adding sodium bi-sulphite in sufficient quantity to form a high-gravity solution. The picric acid present rises to the top in a flocculent form. The sodium bi-sulphate can be re-concentrated for subsequent use. The method was devised by Henry A. Gardner.

## Recent Patents

1,232,783. CONCENTRATOR. James B. Freeman, Los Angeles, Cal. Filed Dec. 23, 1913. Renewed May 2, 1917.

1. A dry concentrator comprising an inclined perforated table provided with diagonal riffles, means for oscillating said table, means for passing air through said table, and means for adjusting said table about an axis perpendicular to the plane of the table.

5. In a dry concentrator, a table having on its upper surface a series of diagonal riffles, a series of low converging walls at the lower end of said table so placed as to form narrow lanes to take all the discharge from said riffles, and thin plates between said walls in said lanes partially covering a series of holes in the table.

1,233,061. FILTERING APPARATUS. William M. Jewell, Chicago, Ill., assignor to Jewell Engineering Company, Chicago, Ill. Filed Nov. 16, 1915.

1. A filter apparatus comprising a chamber containing a filter-bed and provided with an inlet for water to be filtered and an outlet for filtered water, a filtered water receiver in communication with said filter and into which said filter discharges by gravity, and suction-producing means for exerting suction-action in said chamber above said filter-bed to draw water from said container upwardly through the filter-bed for washing the latter, the point at which suction is applied to said chamber being above the said water receiver.

5. A filter apparatus comprising a chamber containing a filter-bed and provided with an outlet for the filtered water, depending partitions extending downwardly partially through said bed and forming filter-compartments closed to each other above said filter-bed, and means for producing suction in said compartments above said bed independently of each other, for washing the bed.

1,231,684. REFRACTORY BRICK. Robert H. Youngman, Pittsburgh, Pa. Filed May 25, 1915.

As a new article of manufacture, a refractory brick, consisting of calcined bauxite, about seven per cent of magnesite or its equivalent, and about one and one-half per cent of chromium ore.

1,232,805. ART OF FILTRATION. William M. Jewell, Chicago, Ill., assignor to Jewell Engineering Company, Chicago, Ill. Filed Oct. 23, 1915.

1. In the art of filtration by gravity, the method of washing a filter which consists in producing a flow of water through the filter-mass reversely of the flow therethrough in the filtering operation solely, by suction applied to the filter above the filter-mass.

2. In the art of filtration by gravity, the method of washing a filter which consists in producing a flow of water previously filtered in the filter, through the filter-mass reversely of the flow therethrough in the filtering operation solely, by suction applied to the filter above the filter-mass.

1,231,790. ORE COOLING, MOISTENING, AND FEEDING TABLE. Adelbert Harry Richards, Salt Lake City, Utah, assignor to American Smelting and Refining Company. Filed July 9, 1914.

1. In a device of the class described, the combination with a furnace having an irregular discharge of ore therefrom, of a horizontal table, means for rotating said table, a fixed hood inclosing said table to form an inclosed casing, said hood having rabble blades disposed in operative relation to said table to mix the ore carried thereby, a spraying device for directing cooling liquid to the ore on said table, a liquid conduit leading to said spraying device, said hood having an outlet for directing the ore from said furnace onto said table and the side of said casing having an outlet for the mixed and wet ore.

5. In a device of the class described, the combination with a hopper adapted to contain a charge of ore, means for drawing said ore from the hopper in a uniform stream, said means including a rotatably mounted table adapted to receive the ore, a bar disposed above the table, a plurality of rabble blades positioned on said bar, each of said blades having a vane disposed at an angle to the path of movement of the ore on the table and spaced from each other to permit the passage of the ore therebetween, said blades being fastened to one side of the axis of rotation of the table acting on said ore to draw the same uniformly from said hopper toward the edge of the table to spread the same evenly on said table, and a spraying device for subjecting the layer of ore on the table to a cooling treatment on the side of said axis opposite the rabble blades.

# REVIEW OF MINING

*As seen at the world's great mining centres by our own correspondents.*

## CRIPPLE CREEK, COLORADO

**NEW STRIKE AND A REVIVAL OF INTEREST ON TENDERFOOT HILL.—**  
**LESSEES SHIPPING AS USUAL.—ANOTHER STRIKE OF HIGH-**  
**GRADE ORE REPORTED IN THE CRESSON CONSOLIDATED.**

The most important development of the past week in this district has been the proving of the continuity of value at depth in the Queen Bess mine, a Tenderfoot hill property, by the owners and operators, Hahnwald, Olsen, and associates. Since the property passed into possession of the present owners, who exercised the option of \$15,500, given them by the C. L. Tutt estate, Mr. Olsen secured the right to extend laterals from the 500 and 900-ft. levels of the El Paso Gold King mine, south of the Queen Bess, and at least 100 ft. lower down, in Poverty gulch, through the Mollie Kathleen and into Queen Bess lines. The 900-ft. level, extended at a point 200 ft. south of the original ore-shoot, has opened up ore of shipping grade. The depth below surface on the Queen Bess is fully 1000 ft. and is the deepest working on the hill. The discovery has given encouragement to operators and property owners of that part of the district and other properties long idle will now be developed.

The Wide Awake, a Raven hill property, originally owned by the Wide Awake Gold Mining Co. and now owned by the Willshire G. M. Co., a close corporation, is again in the shipping class, Porter Hedge, lessee. Hedge shipped a trial lot last week, 5 tons each of screening and coarse rock. The screenings ran \$46 per ton and the coarse rock \$27 per ton. A second shipment is being taken out. The property had been shut-down for several years.

The Bertha B. on Raven hill, near the Cresson mine, owned and operated by Carl Johnson of Denver, will commence shipping by the first of the ensuing week. A road is being graded from the ore-house to the loading-station in Eclipse gulch and ore sorters are getting out the first shipment.

The New Boston, a Stratton Estate property on Womack hill, has been brought back to the producing class. A. E. Gilbert, the lessee, loaded out a shipment last week that returned about \$30 per ton.

The El Paso Extension Corporation, whose officers and stockholders are from the Southern States, are operating extensively on the southern slope of Beacon hill. The company has a lease with option to purchase, on the Rocky Mountain and North Slope claims, formerly owned by the Rocky Mountain G. M. & M. Co. and on the Hiawatha, a near-by property, and have started to drive a cross-cut adit to exploit the territory. Al Campbell, former superintendent of the Gold Dollar and Isabella mines, is in charge.

A prospecting permit with lease and option has been secured by Sam W. Vidler, on the properties of the Republic Gold Mining Co., the Janet W., Laura M., and Lester W., containing about 9 acres, on the western slope of Beacon hill, north of the Rocky Mountain and south of the El Paso Gold Mining Co.'s property, and has men prospecting. Frank Hervey Pettingell, president of the Los Angeles Exchange, is president of the Republic G. M. Co. This new work on Beacon hill is being closely watched and, in the opinion of mining men, ore will be found.

Articles of incorporation have been filed for the Ocean

Wave Mining Co., which holds a long-time lease on the Ocean Wave on Battle mountain, and has installed machinery and is sinking a new vertical shaft at the line between the Ocean Wave and Little May. Both properties are included in the lease from the Portland company.

Irving T. Snyder, vice-president and general manager for the Vindicator Consolidated Gold Mining Co. and secretary-treasurer of the Golden Cycle Mining & Reduction Co., has tendered his resignations of all offices excepting that of vice-president of the Vindicator company, and has removed with his family to Santa Barbara, California.

The July output of the United Gold Mines Co., made by lessees on the Trail mine on Bull hill, the W. P. H. mine, on Ironclad hill, and the Bonanza on Battle mountain, approximates 750 tons of ore with a gross bullion value of between \$57,500 and \$60,000.

A report is current in the district that another rich discovery of ore has been made at the 1500-ft. level of the Cresson Consolidated Gold Mining & Milling Co.'s main shaft. The report has not been confirmed officially, but is believed to be reliable.

## BRITISH COLUMBIA

**LARGE IRON DEPOSITS BOUGHT BY D. C. JACKLING AND ASSO-**  
**CIATES TO SUPPLY AN IRON AND STEEL PLANT TO BE BUILT AT**  
**SEATTLE.**

The purchase of iron-ore deposits on Vancouver island, estimated to contain several millions of tons, has been completed by D. C. Jackling and associates. This ore will be used to supply a large steel plant, which is to be erected by them, near Seattle. This confirms the reports regarding the establishment of a steel plant and the opening up of the iron deposits of British Columbia. So far there has been little development on these orebodies owing to the lack of smelting facilities, but large deposits are known to exist and have been the subject of Government reports.

Most of the iron deposits are on Vancouver island, and it was there that the principal option was secured. Other options are held, however, in this Province, and also in the State of Idaho.

A 500-acre site for the steel plant has been obtained near Seattle, where it is proposed to erect blast-furnaces and steel-mills, also a coking plant for the treatment of such by-products as gas, tar, and ammonia.

Construction of the new plant soon will begin and it is expected to turn out pig-iron within a year. As soon as rolling-mills can be equipped ship-plate will be made. Forged billets, car-axes, and tin-plate also are to be included in the output of the plant.

The iron ore involved in this transaction is situated on the Gordon river, on the west coast of Vancouver island, a short distance north-west of Victoria, and almost due north of Cape Flattery. They have been under option since April 1913 to the Alaska-Gastineau Mining Co., which has made the first payment on the \$250,000 purchase price.

The iron ore in this group of claims is practically all magnetite, carrying from 60 to 65% iron.

Options on five other large properties in British Columbia, it is said, are also controlled by the Jackling interests, two

being on the mainland, not far from Vancouver. In addition to these the same financiers have secured options on three valuable quartz and dolomite claims, one on Vancouver island, one on Quatsino, and one on a small island in Cardero channel.

Representatives of the Alaska-Gastineau Mining Co. announce that at least \$100,000 will be spent shortly on bunkers and a wharf at the claims at Gordon river, which are conveniently situated for shipping by water. The development of the claims is to be commenced promptly and it is planned to take out a large supply of ore in readiness for the completion of the smelter.

As a side issue of this transaction there is being perfected a system of producing coke from local coal. It is claimed that this coke can now be produced in British Columbia at a cost of \$6 per ton and that it will be superior to the \$14 Pennsylvania coke.

No one kind of British Columbia coal will produce a metal—it has been found that by mixing coal from the various Pacific it has been found that by mixing coke from the various Pacific Coast mines, including a little of the Washington coal, a coke equal to if not superior to that produced in Pennsylvania can be made. The larger part of the coal used is from the Nanaimo mines on Vancouver island.

### SUTTER CREEK, CALIFORNIA

THE KEYSTONE MINE BEGINNING TO SHOW A MUCH MORE ENCOURAGING BALANCE-SHEET.—THE CENTRAL EUREKA IMPROVING, AND ALL STAMPS DROPPING.—PREPARATORY WORK CONTINUES AT THE OLD EUREKA.

The semi-annual report recently issued by the Keystone Mines Co., of Amador City, shows that the 40-stamp mill has been in continuous operation since the first of the year with the exception of 10½ days lost by order of the California Debris Commission on account of tailing, and about 2 days lost as a result of repairs, clean-up, and electric power being off. During this period, 39,896 tons of rock went through the mill, yielding \$14,281 in bullion and 1505.124 tons concentrate, valued at \$84,893.12. From this estimated total yield of \$99,174.12 must be deducted freight and smelter-charges to the amount of \$18,061.64, leaving a net product of \$81,112.64, or about \$2.03 per ton of ore worked. The company's expenditures for the past six months are segregated as follows:

Operating expenses, mine and mill.....	\$75,200.00
License tax .....	32.75
Salary of manager, postage, and stationary.....	1,994.40
Total .....	\$77,227.15

The company's indebtedness of \$20,423.43 has not been reduced during this half-year, but conditions in the mine justify the hope that ore of better grade will soon be accessible, and the fact that the old mine has been able to hold its own, despite high costs of material and labor, on ore of such low grade, speaks well for future operations. Work is in progress on the 900, 1000, 1200, 1400, and 1800-ft. levels, the greater part of the ore having come from the 1200 and 1400-ft. levels. The 1800 station has been completed and a cross-cut driven east 550 ft. Upon reaching the vein at a point 500 ft. east of the shaft in this cross-cut, drifts were started north and south, the latter having been extended 100 ft. in ore all the way, conditions being also encouraging in the north drift. Carlton R. Downs, of Sutter Creek, is manager for the Keystone Mines.

For the months of May and June, the Central Eureka Mining Co. reports total receipts of \$21,944.57, of which \$9068.02 was derived from bullion and \$12,571.52 from concentrate, the remainder being insurance re-fund and proceeds of supplies sold. The expenses for the same period amounted to \$29,204.02, making a net loss of \$7259.45. This is due in part to the extensive development and repair-work carried on in the

mine, and to the re-inforcement of the tailing-dam, as required by the Debris Commission. The list of expenditures for the two months includes \$4284.78 for development, \$4159.37 for shaft and mine-repairs, and \$1956.96 for strengthening the tailing dam, while the actual cost of mining and milling the 7760 tons of ore totals less than \$15,000. The underground preparations made during May and June for extensive ore extraction enabled the company to start additional stamps during July and the 40 stamps have been in operation for about a month with encouraging results.

Clearing and re-timbering old drifts and repairing the shaft continues at the Old Eureka, and the company has just completed the construction of an up-to-date change-house for their employees.

### HELENA, MONTANA

REVIVAL OF MINING ABOUT HELENA.—MANY OLD-TIME PRODUCERS AGAIN IN OPERATION WITH GOOD RESULTS.—GRASS VALLEY DISTRICT AGAIN PROSPEROUS.—THE JARDINE DISTRICT.

It is many years since there has been so much interest in mines and their development in the districts within a radius of 30 miles of Helena. For years the mining industry near Helena has been dormant, but it is stated that within the several months past, more progress has been made in mining in the region about Helena than in a decade before. While the developed mines that are producing and shipping are not many as yet, the number is rapidly increasing.

The Grass Valley district, west of Fort William Henry Harrison, which was practically dead a year or so ago, is now active. The present demand for the metals of the district, principally lead and silver, with some gold, has stimulated development.

The Rock Rose and Looby mines of the Cruse Consolidated Mining Co. are the most prominent of the Grass Valley district. The Looby is on the same vein as the Helena group and parallel to the vein of the Rock Rose. On the latter the vein at 200 ft. depth is 6 to 8 ft. wide, with a two-foot pay-streak on the hanging wall, having a value of \$100 per ton, 35% lead, 31½ oz. silver, and 80c. in gold. The average value of the vein is \$32 per ton. A station has been cut at the 200-ft. level and the shaft will be sunk to 300 ft., from which point drifts will be run. The inclined shaft on the Looby is down 160 ft. in ore of unknown width, which assays 20 oz. silver and 20% lead per ton. Improvements and new machinery will be placed as development warrants. Headquarters of the company is at Helena, with James J. Cruse, president; E. D. Phelan, vice-president; and R. A. Weisner, secretary.

The Helena mine at Grass Valley, near Fort William Henry Harrison, under the control and management of the Helena Mining Bureau, is making weekly shipments to the East Helena smelter. The ore nets \$22 per ton. This property was one of the first in the Grass Valley district and considerable good ore was taken out in the early days. It is located between the Looby and Rock Rose properties.

Gold ore to the value of nearly \$4000 per car, is going out from the Scratch Gravel Gold Co.'s property, at the rate of two cars per week. A pump has been installed which will lift 200 gal. per minute.

At the True Friend shaft, a new gasoline hoist has been installed. The shaft is in ore to a depth of 150 feet.

The mining district of Jardine is about seven miles from Gardiner, in a region of crystalline schists, which have been penetrated by rhyolite and trachyte dikes. The principal old mines, that have been idle for a decade, resumed operations during the past winter. The new companies are managed by practical men and engineers. The mines of the district have a record of over \$3,000,000. Scheelite, carrying from 50 to 60% tungstic acid, is found in spots throughout the district.

The mines of the Maiden district, in Fergus county, are be-

ing worked by lessees. The ore runs about \$8 in gold per ton. The McGinnis has produced over \$1,000,000; the Spotted Horse, \$3,000,000, and the Cumberland, \$350,000. William A. Young, lessee of the McGinnis, has transformed the old mill into an up-to-date cyanide-plant, using crusher and rolls. The Spotted Horse is under lease to E. B. Coolidge; and the Cumberland to George Wiezlader. These properties, with the Gilt Edge, are gold producers, with cyanide treatment.

### MARYSVILLE, MONTANA

THE DRUMLUMMON MINE AGAIN A PRODUCER.—THE SHANNON DEVELOPING INTO A VALUABLE PROPERTY.—THE OLD CORBIN DISTRICT ONCE MORE IN PROFITABLE OPERATION.—A GREAT PRODUCTION IN THE PAST.

The 80 tons of ore mined daily in the Drumlummon mine, now under control of the St. Louis Mining Co., is milled at the old 25-stamp mill, and then treated by continuous cyanidation. The mill is operated by electric power. William and Charles Mayger are in charge.

The Shannon mine, in the heart of the Marysville district, is surrounded by the great mines of the past. It is developed by a 750-ft. adit, with a hoist at the 500-ft. point, where a shaft has reached a depth of over 300 ft., giving a depth below surface of over 750 ft. The vein is from 4 to 35 ft. wide, with an average of 12 ft. The ore assays about \$20 per ton, principally in gold. One hundred tons per day is sent by aerial-tram two and one-half miles to the Piegán-Gloster mill near Marysville, where three 10-ft. Lane mills are operated. Forty men are employed at the mine, which is owned by the Barnes-King Development Co. Thirty samples, taken for 150 ft. along the 500-ft. level, gave average returns of \$76.60 per ton. W. R. Price is in charge.

The re-opening of the Blue Bird group, near the Shannon, by the Marysville Gold Mining Co., for which L. S. Ropes is the consulting engineer, has been undertaken, and new development along the foot-wall of the old workings is meeting with encouraging results.

Throughout the Corbin mining district, 35 miles east of Butte, is found the Butte granite, and the fracturing of the rocks is identical with that at Butte. In this district are found the carbonate and sulphide of lead associated with bismuth, chalcopryite, cuprite, chalcocite, and native copper. The silver ores are the same as those at Butte. Gold is associated with all the ores, ranging from \$1 upward per ton. The first discoveries in the district were made in 1864, and since that time the Alta mines on Alta mountain are credited with a gross production of more than \$40,000,000 in lead, silver, copper, and gold. The depth of the Alta is 1600 ft. About 100 men are employed at the Alta mines and concentration plant. James Madden is in charge of the development.

On the east side of the Alta mountain is the Boston Corbin property. There are at least 10,000 ft. of workings, including shafts, tunnels, and drifts, to a depth of 1300 ft. in fissure-veins 2 to 10 ft. wide with copper and silver, and 30c. in gold to a unit of copper. The monthly production is 70,000 lb. of copper and 5000 oz. of silver. The concentrating plant has a capacity of 200 tons per day. Eighty men are employed. D. J. Courtney is superintendent.

The Montana Zinc Co., lately leasing the Minnie Shea, which adjoins the Rarus group in the Corbin district, has put in machinery. The 250-ft. adit cut two veins of silver, lead, and zinc ore that assays \$78 per ton. The main vein is 6 ft. wide. The vein is in the Butte quartz-monzonite.

The Crystal Copper Co. owns 84 acres in the Cataract mining district, eight miles from Basin. The ore in the Crystal vein is from 30 to 40 ft. wide. Several shafts have been sunk from 60 to 130 ft. The ore runs 3 to 6% copper, 6 to 13 oz. silver, and 80c. in gold, per ton. Walter Harvey Reed is in

charge. The Minah mine west of Alta mountain near Wickes has a record of \$1,250,000 in silver, lead, and gold. There is much unexplored ground. It is owned by the Pittsburgh Minah Development Company.

The Comet, another old mine with a record of more than \$13,000,000 in lead, silver, and gold, is again in operation. The main shaft is down 976 ft., where zinc ores are practically intact as in former days of development.

The Carbon Hill Mining Co. proposes sinking to a depth of 400 ft. and is shipping ore from the 100-ft. level. The property is equipped with two gasoline engines and a hoist. When the limit of gasoline power is reached a 40-hp. steam-plant will be installed.

At Basin is a profitable concentrating plant owned and operated by Max Atwater. He is treating tailing from former concentrating of zinc ores. His payroll is stated to be \$15,000 per month. His proposed hydro-electric plant will be able to effect a great saving. Instead of shipping the zinc when the plant is in operation, only spelter will be sent to market.

### HOUGHTON, MICHIGAN

HEAVY PRODUCTION OF COPPER FOR AUGUST.—LABOR CONDITIONS SATISFACTORY.—ISLE ROYALE'S GREAT OUTPUT.—CALUMET & HECLA MAINTAINS ITS STATUS.

Michigan's production of copper for August will approximate 26,000,000 lb. if the present rate is maintained. This is a larger amount of refined copper than has been turned out any month this year, excepting January. Production is running close to normal and while there has been an increase in the number of men employed in the Lake Superior district, the total number of working days will not show any increase for the reason that miners and trammers are making so much money that they can afford to take vacations as they please. Likewise some of the men own farms and are working on them. There is no accumulation of copper at the docks, practically all of the August production having been contracted for early last spring. Shipments are being made by both water and rail, the larger amount going by rail, notwithstanding the greater expense. General labor conditions here are excellent, and the men are getting larger wages than ever before in the history of the district and there is work for all. Wise miners, realizing that paid agitators were sent to practically all of the iron and copper mining districts of the United States, figured that these conversationalists will accomplish little in the Michigan copper country, so the best miners applied for work in this district. The I. W. W. gang did not make any headway in its efforts to stir up trouble in the Michigan district and the few agitators who visited this district took good jobs and went to work, or hurriedly left the district.

The Isle Royale is one of the instances of low-grade copper production in this district. When it had become evident that there was only one hope for a mine that produced an ore that averaged but 12 or 13 lb. of copper per ton, and that was by the output of an enormous tonnage of rock, there was little to the future for the Isle Royale except hope. Now the Isle Royale is running on an average of better than 15 lb. of copper per ton. The average for last month was 15 lb. and for August to date 16 lb. While the output of rock is not as large as it will be later it is keeping its own stamp-mill running to capacity and sending 450 or 500 tons daily to the Point Mills plant, and it could send 1000 tons daily to the custom-mill if the miners could be secured. The property is operating profitably. The seventh shaft is down to the ninth level and the most southerly openings are in rock which runs a little better than was anticipated and as good as anything recently opened in any of the Isle Royale shafts.

One shaft of the Champion mine continues to produce rock

from four levels that run better than 50 lb. of copper per ton.

The tonnage from the shafts of the Calumet & Hecla is not yet up to 10,000 tons per day, but it is crowding that figure, and by October more than 9500 tons daily can be counted on. There is practically no change in the average run of the rock. Four months ago there was little enthusiasm for the White Pine property as a permanent producer, but present indications show an improvement, and the application of the improved concentration process has added 30% to the copper recovery from the sand.

The Osceola Consolidated is showing a steady improvement in the value of the rock from the drifts south of No. 6 shaft. The average run of rock from the old Osceola mine has been lower than that produced from the North Kearsarge but the south drift toward the La Salle line, continues to improve and other levels running into the same territory show rock much better than any other found in this mine. Two shafts at South Kearsarge continue to furnish the richest rock that comes from the Kearsarge lode at any point. The total daily output is 3700 tons.

At three points the Quincy is showing an improvement in the grade of rock. The encouraging feature is that the improvement is at the lowest point at which the mine is operating. Quincy is shipping some copper by water and has 1000 tons on the docks at the smelter, all sold for delivery.

### PLATTEVILLE, WISCONSIN

NEW JERSEY ZINC CO. MAKES A RICH FIND.—CRIMINAL CARELESSNESS.—MINERAL POINT REVIVING.—NEW MINES OPENED AND SOME OLD ONES CLOSING DOWN.

During July the New Jersey Zinc Co. struck rich veins of zinc ore,  $2\frac{1}{2}$  ft. thick, on the Clark-Underwood range, in the Highland district. At Montfort, the Hump Development Co., operating the O. P. David mine, was put out of business by an adverse decision rendered by the Industrial Commission on claims growing out of a dynamite explosion in the change-room at the mine on April 13, 1917, when one man was killed and eight others seriously injured. The David mine was shut-down, and it was said officially no further attempt would be made to mine this property under the present management. The heavy penalty imposed, says the Commission, follows a violation of safety orders, which prohibits the storage of dynamite and other explosives in the change-house or in other buildings frequented by employees.

The Linden district had some set-backs, several producers shutting down permanently, among them the Glanville, an old-time producer, and the Wickes, a more recent development. The Weigle mine, of the Saxe-Pollard Co., was shut-down after a determined effort to make it a success and the equipment will be removed to new quarters, where the company is developing new mines. The Stoner Bros. Mining Co. purchased the Wickes equipment and began removing it to its mine.

Mineral Point, the site of a great oxide works, but for several years backward in mine operation, is reviving. The Utt-Thorne Mining Co. is responsible for the awakening in mining. The McIlhlon mine, Harris mine and equipment, and the Pierson leases are in this company's hands and are producing and shipping. The electric-power company has extended its lines in the northern districts to new mining towns and to several operating companies.

The Mifflin district, including Livingston and Rewey, had a good month through the operations of the New Jersey and Vinegar Hill Zinc companies. The new Yewdall mine shipped a car of ore daily, the new lands adjoining, drilled and now ready for production, will be permitted to rest until the labor conditions are more encouraging. The M. & A. Mining Co., of Platteville, operating the Big Tom mine at Rewey, paid a 25% dividend on July 15, and followed by another of 25% on

July 31, making 150% paid since the mine began operating last March. Officials have brought in additional leases where drills are at work and extensions of the main ore-bearing vein are shown on the new tracts leased for mining.

At Dodgeville the North Survey mine with equipment is making regular weekly shipments, something the district has not known in several years, although there are others operating that are well established. The North Survey mine points the way to some excellent deposits in a stretch of country as yet untouched by the prospector.

Platteville, in the geographical centre of the field, fared badly all month, shipments from local producers being light. The Bell Mining Co., after providing equipment and getting down to a shipping basis, pulled up the pumps and quit. Further action will be left to a meeting of stockholders called for August 7. The New Rose Mining Co. paid off its indebtedness during July and laid aside a sufficient amount to declare a 40% dividend. The Block-House Mining Co. (Kistler-Stephens Co. owners) declared a 50% dividend, and since the mine began operations, one year ago, has paid \$80,000 in dividends, which is 400% on its capitalization. At the end of the week, July 28, 1100 tons of roasted blende and 1400 tons of crude zinc concentrate was held in bin, 290 tons of 43% zinc ore was made in the last week of July. The Block-House vein has been drilled out for nearly one-half mile ahead of the breast now being broken. The company has drills at work on the McGregor, Heffernan, and Kistler lands, all having remarkable success. The Mann & Harding Mining Co. ships one car of high-grade ore per week. A. W. Plumb, general manager for the Wisconsin Zinc Co., who took charge of the company's holdings July 1, is planning big undertakings.

The Cuba district, noted for the operation of two magnetic separating-plants, was busy throughout the month. Receipts of ore were high and shipments of the finished product were regular. The C. S. H. Mining Co., recently organized by Platteville and Milwaukee men, bought the old Roosevelt plant and had it removed to the G. O. P. mine on the Raisbeck lease, where the contract called for operation August 20. At the National Separators, Cottrell electric precipitators were installed to collect dust and gas-fume. The Stafford Mining Co., working on a new range, put down two shafts and began the shipment of zinc ore. Pumps were installed in shaft No. 1, of the Coulthard mine and two shifts were put to work in shaft No. 2 on the Dall mine.

In the Shullsburg district the Winskill mine, of the Wisconsin Zinc Co. reported indifferently. The Rodhams-McQuitty Mining Co. is on a profitable shipping basis selling high-grade lead and zinc ore. The Oliver-Mulcahy mine, idle in June, shipped two cars of high-grade separator-ore weekly during July. The Rowe Mining Co. supplied a surface-rig to the Milwaukee-Shullsburg mine. The Fields Mining & Milling Co. took the Pacquette farm and mine under option. The owners of the land lacked the capital to develop this find, reported to be rich, and the new owners, successful operators of the Crawhall and Thompson mines, soon will get the new ground into shape for mining.

The Benton district is producing more than one-half of the mine-run output of the entire field. The principal producers are the Wisconsin Zinc Co., the Frontier Mining Co., and the Vinegar Hill Co. Two of the finest mills in the field were recently completed for the Frontier Mining Co. The Vinegar Hill Co. has a new producer in the Meloy mine, shipments the last week of July running better than one car per day. A new mill is completed for the Wisconsin Zinc Co. on the Cope-land estate, which will commence operating in August. Another new mill has been completed for the Strawbridge Mining Co. of Milwaukee. The Zinc Concentrating Co., of New York, investigated several properties in the district, seeking a number of low-grade zinc-ore producers to supply a magnetic separating-plant planned for the Cuba station. The New Jersey Zinc Co. has a new producer in the Hoskins mine.

## TORONTO, ONTARIO

THE DOME MINES.—CONIAGAS NEGOTIATING FOR NEW PROPERTY.

—PRODUCTION AT COBALT INCREASING.—RICH ORE DISCOVERED AT THE HARGRAVES.—LARGE COPPER DEVELOPMENT AT SCHIST LAKE.

The Dome Mines has passed its dividend, the reason assigned being the heavy expenditure required to carry on development work. This caused no surprise in mining circles, as it had been anticipated for some time. The Porcupine Crown, which had been paying quarterly dividends at the rate of 12% per annum, has also suspended dividends for the present, as the shortage of labor renders it impossible to keep development ahead of production. The directors announce that their policy will be to limit production to the amount necessary to meet expenses. Operating profits for the six months ended June 30 were \$124,179. Contrary to expectations the production of the McIntyre in July, which amounted to \$137,790, was less than in any preceding month of the current year, and the average value of the ore treated, \$9.32, was the lowest in seven months. During the first four months of the year the average grade of the ore was \$10.43. The main vein, which is being driven at the 1000-ft. level, divides into two branches just over the Jupiter line, one of which is over 12 ft. wide and very high in grade, the remainder averaging \$12 per ton. At the Keora the main vein, about 16 ft. wide, has been cut by diamond-drilling 750 ft. below the surface where it averages \$6.26 per ton. Vein No. 2, cut at a depth of 615 ft., assays \$4.20 throughout a width of 41 ft., and vein No. 3, which is 2 ft. wide, and was cut at 430 ft., assays \$33 per ton. Another high-grade vein has been found at a depth of 380 ft. The Coniagas, at Cobalt, which is operating the Anchorite, is negotiating for the Maidens-Macdonald property adjoining, which was formerly under option to the La Rosa. The Kirkland Lake has cross-cut the main orebody on the 700-ft. level, but the width at this depth has not yet been ascertained. The Teek Hughes is sinking to the 600-ft. level on vein No. 1. A small fire in the 'rock-house' on August 6 did damage to the amount of \$1000, but caused no serious delay in operating.

At the Croesus, in Munro township, where difficulties have been occasioned by flooding, new pumping equipment has been installed and the flow of water checked sufficiently to permit a resumption of operation. The mill is working steadily on ore from the dump, the gold content of which is about \$40 per ton. Production at Cobalt lately has been stimulated by the high price of silver, and shipments have been heavy. During July the Nipissing mined ore of an estimated net value of \$272,490, and shipped bullion and residue derived from its own resources and from custom ore of an estimated net value of \$295,495. The total bullion recovery for the year to the end of July was \$1,765,167. The new flotation plant of the McKinley-Darragh, the machinery for which is being installed, is expected to be in operation within the next few weeks. This will give a total capacity of 500 tons per day, half of which will be taken from the mine and the other half from the tailing dump, to be re-treated by flotation. Improvements have been made in the hoisting facilities to handle the increased tonnage. It has been found that several bodies of low-grade rock, which could not be profitably treated two years ago, are now of economic value, owing to the increased price of silver. At the Hargraves, in driving an old vein, a lens of high-grade ore stated to assay about 5000 oz. per ton, has been discovered. It is more than 6 in. wide, and is accompanied by good ore on both sides. There is a large quantity of low-grade millable ore on the dump which, under present conditions, can be profitably treated. The Adanac has begun stoping, and is sacking ore for shipment.

Development in Rickard township, about 40 miles north-east of Porcupine, where a recent gold discovery attracted a

number of prospectors, has been delayed by the refusal of the Provincial Mines Department to grant working permits. It appears that the Abitibi Pulp & Paper Co. is constructing a dam in the neighborhood, which, when completed, may flood a considerable area of the gold-bearing district and mining operations cannot be undertaken until some arrangement for protecting the company's rights can be effected.

The copper deposits of the mineral belt of northern Manitoba are undergoing active development. At the property of the Mandy Mining Co. at Schist lake, from which 3600 tons of sulphide ore was shipped to the Trail smelter last winter, the crude makeshift equipment first in use has been replaced by modern machinery. The shaft is down 90 ft., and when the 100-ft. level is reached driving will be undertaken. It is proposed to take out at least 8000 tons of ore before spring, for shipment next year. At the Flin-Flon the most extensive deposit of sulphide ore so far discovered in Manitoba is being exploited by diamond-drilling. Approximately 6000 ft. of hole has been drilled this year, and over 6,000,000 tons of sulphide ore thereby has been proved.

## COBALT, ONTARIO

HEAVY OUTPUT MAKES RECORD PRODUCTION FOR THE YEAR.—INCREASED BONUS BEING PAID.—NEW DEVELOPMENT AND NEW MILLS.—INCREASED PRICE OF SILVER OFFSETS HIGHER COST OF OPERATION.

During the first week of August, Cobalt companies sent out 900,000 lb. of ore. During the month of July a total of 3,621,300 lb. was shipped, which is a new high record for one month during the current year. Bullion shipments for the year so far total 6,100,344.61 oz., valued at \$4,614,843.54. Nipissing, with over 3,000,000 oz. was the heaviest shipper; the Mining Corporation, with over 2,500,000 oz., was second. The camp is well supplied with men but their efficiency is low. The increasing cost of production is being offset by the higher quotation for bar silver. The 50c. per day bonus to mine workers when silver averages over 70c. per oz. is being paid, and when the average is over 80c. for any one month an additional 25c. per day bonus will be paid. In July the average was a fraction below 79. The mine workers are now anticipating the extra bonus. It is an interesting fact that an increase of one cent per ounce adds \$200,000 to the value of the 20,000,000 oz. annual output from Cobalt district, and an increase of 25c. per day to the 3000 men employed approximates \$225,000. Thus a one-cent rise will nearly pay the extra bonus.

The report recently issued by the Kirkland Lake Gold Mines, Ltd., which is controlled by the Beaver Consolidated, of Cobalt, shows approximately 6000 tons of ore in the dumps, valued at \$60,000. The ore blocked out underground is valued at \$420,000. It is proposed to sink a new shaft 500 ft. west of the present workings, where a 150-ton mill will be erected. The main shaft of the Kirkland Lake Gold Mines is down to the 700-ft. level where the downward continuation of the main orebody was reached recently, and which is similar to the ore at and above the 600-ft. level. The average grade of the ore is around \$10 per ton.

The official report of the Kerr Lake output for June was 251,367 oz. silver, making a total of 2,195,485 oz. for the 10 months ended June 30 and indicating approximately 2,700,000 oz. for the 12 months ending August 31.

To the north along the contact, the Chambers Ferland property of the Alladin Cobalt Co. is finding high-grade ore. The Alladin, formerly an English company, will be listed within the next few days on the Standard stock exchange.

The flotation plant at the McKinley-Darragh is nearing completion. A part of the machinery is in place, and within a few weeks the mill will be ready for operation.

# THE MINING SUMMARY

*The news of the week as told by our special correspondents and compiled from the local press.*

## ALASKA

(Special Correspondence.)—Twelve men under the direction of W. Krippachne have started development work on the Auk Bay property recently bonded by the Treadwell company. One of the big boilers from the Treadwell Central power-plant is being shipped to Camas, Washington, where it will be used in a pulp-mill.

Lynch Brothers, diamond-drill contractors, have sent a drill and crew to El Capitan, on the west coast of Prince of Wales Island, where they will drill the marble deposits at that place. The crew will be in charge of Fred Lynch. The El Capitan marble deposits were formerly worked extensively, but the quarries have been idle for some time. Henrie Brie and associates of Douglas, who are interested in mining claims at Auk Bay, have had men at work constructing a road over which machinery and supplies can be taken to the properties. The exports from Alaska for July, as compiled by the local custom-house, show a marked increase in value, due in part to the salmon shipments and the large shipments of gold. The total value of all exports of Alaskan products, including gold, during the month amounted to \$6,357,966. The copper ore shipments amounted to \$2,288,708. The value of gold bullion, gold ore, and silver ore shipped was \$1,914,011.

Chas. T. Counsell, Federal Immigration officer, has arrived at McCarthy, as a representative of the Department of Labor, to investigate the Kennecott strike, report on conditions, and mediate a settlement if possible. The Kennecott imported men are not being interfered with and the plant is running at about a fourth of its capacity. There are 240 men working, most of these are from the Government railroad, canneries, and different points in south-eastern Alaska. The Bonanza mine is idle, but the reserves in the Jumbo have been drawn on to keep the mills running.

Treadwell, August 5.

## ARIZONA

### YAVAPAI COUNTY

(Special Correspondence.)—The General Development Co. has taken over the Mayer-Belford group of 11 mining claims four miles east of this place, and the Ewing & Hooker mine near Jerome. The finding of high-grade ore on the 600-ft. level of the Arizona Binghamton is evident in the flotation-mill. Large orebodies running from 2 to 3% copper have been found in the Copper Queen mine adjoining the Arizona Binghamton, and a 3-ft. vein of 25% copper ore has been cut in a 40-ft. shaft on the Big Bug Copper Co.'s ground a mile south of the Copper Queen. The Barbara mine is in the hands of Blisbee lessees, John Ross, W. A. Tucker, James Smith, and Lee Hunt, in the same district. Senator Reynolds and Celora Stoddard have begun the reorganization of the old Stoddard Mining Co. and will do extensive development. High-grade copper ore has been discovered in a 50-ft. shaft by O. M. Bywaters, of Roxton, Texas, on a property south-east of the Copper Queen. The Half Moon company will start development.

The Mayer-Belford mine is known locally as the Christmas, having been located by William Belford on a Christmas day. The group is five claims long, covering a strong outcrop of mineralized schist and iron. At several places along the strike, the vein is from 200 to 300 ft. wide and there are zones of it that will run from 2 to 17% copper. A shaft has been

sunk 50 ft. It is reported that each owner has received a cash payment and a block of the stock in payment in full for their holdings. The company will give particular attention to the Ewing & Hooker mine, near Jerome. It is reported that \$250,000 was paid for this property, a good sized payment having been made, the balance being due at the end of the year. It is also said that work will be commenced on the Christmas mine at Mayer within 90 days. It is reported that the General Development has put up \$500,000 so far.

The district around Copper Mountain covers an area at least five miles square with many properties yet to be exploited adjacent to the mines already taken over by various companies. Prospecting can be carried on easily, as there is no sedimentary formation covering the mineralized formations, which in many cases can be traced across the entire district.

Mayer, August 15.

## CALIFORNIA

The State Water Commission has approved the following applications, granting permits for the appropriation of water for mining and power purposes:

La Grange Mining Co., 10 cu. ft. per second of the waters of Salt creek, tributary to Stuart's Fork in Trinity county for hydraulic mining purposes, the water to be returned to the stream.

G. D. Melkeljohn of Omaha, Nebraska, 0.19 second feet of springs in San Bernardino county for mining purposes, the gold mines proposed to be served being at the south end of Providence mountain. The works consist of a masonry dam 10 ft. high, 30 ft. on bottom and 20 ft. on top, and a pipe-line 4 miles in length, the estimated cost being \$5000.

J. Irving Crowell, of Los Angeles, 0.05 cu. ft. per second of Cane Springs for gold mining 15 miles south-west of Rhyolite, Nevada. There is a pipe-line half a mile long. The estimated cost of the diversion is given at \$7000.

Southern California Edison Co. of Los Angeles, permit under section 12 of the Water Commission Act, fixing the time for the completion of a diversion that originated prior to the time the act took effect. Amount not to exceed 600 cu. ft. per second of the waters of Kern river, for power purposes. Actual construction is to begin by September 1, 1917, and be completed by July 1, 1922. The estimated cost of completing the project, exclusive of transmission lines, is \$4,118,295. The total capacity of the plant is given as 30,000 kw., the total fall to be utilized as 800 ft. and the theoretical horse-power to be developed as 54,545.

Mariposa Mine Association of Alleghany, 0.3 second feet of Steamboat gulch waters in Sierra county, for mining purposes, the water to be returned to the stream after use.

H. S. Williams, of Los Angeles, the waters of a mountain spring in Ventura county for the development of oil-wells.

### CALAYERAS COUNTY

(Special Correspondence.)—At the Buffalo gravel mine a Delster concentrator has been placed in the mill to save the fine gold. Preparations are being made to work continuously throughout the coming winter.

Mokelumne Hill, August 14.

(Special Correspondence.)—The Newman mine is mining and crushing pay-ore. New machinery is being installed.

There is a general revival of interest in mining in this district.

West Point, August 14.

Suit for \$850,000 was filed August 10 in the United States District Court by E. G. Parlow, C. A. Tarbat, Domingo and R. Roleri, owners of the Finnegan Extension quartz mine, against the Melones Mining Co. It is alleged that the owners of the Melones mine have extended its workings into the Finnegan property and that 170,000 tons of ore, valued at \$5 per ton, has been taken out. The property involved in this suit is situated on and near the summit of Carson hill, in the southern part of the county.

#### DEL NORTE COUNTY

(Special Correspondence.)—Otto Anderson is opening up copper ore on one of his claims in the Shelley Creek district.

The Monumental mine, which has been idle for several years, also on Shelley creek, is to be re-opened by Eastern parties. There is a large tonnage of ore developed running well in gold.

J. C. Kendau and Earnest Rackliff, of Nevada, have been examining the John Griffin cinnabar property on Diamond creek, adjacent to the Ehrman cinnabar mine.

A rich shoot of copper ore has been opened at the Old Crow property, situated in the Monumental district. The vein is 3½ ft. wide. It is owned by F. E. Bauman, of San Francisco, and managed by E. A. McPherson, of Crescent City.

J. N. Britten is cross-cutting a body of copper ore in the Patricks Creek district.

Chrome ore is now being shipped from the Gravlin property at Cold Spring.

Crescent City, August 13.

#### MENDOCINO COUNTY

(Special Correspondence.)—The Sullivan Machinery Co. is moving its diamond-drill machinery from Yreka to commence new operations after completing the contract with the Gray Eagle company on the Klamath river in the Happy Camp district, where 8000 ft. was drilled for the company, and the result showed that everywhere the ore went down to a great depth, and proved to be rich.

Yreka, August 16.

#### NEVADA COUNTY

(Special Correspondence.)—J. H. Batcher, of San Francisco, has purchased the Summit mine, near Nevada City, from the Mountaineer company and will consolidate it with the Mohegan and New England mines. It is planned to rehabilitate the deep New England shaft for working purposes and to build a mill. A large tonnage of milling ore is stated to be blocked out in old workings.

M. J. Brock and associates have begun work on the Oak Tree claim, within the city limits of Grass Valley. The 200-ft. shaft has been repaired to a depth of 40 ft. The claim was worked with good results in pioneer days.

C. K. Brockington, superintendent of the Golden Centre, is rapidly completing arrangements for sinking the 1000-ft. shaft to 2000 ft., where it is expected to recover the rich faulted veins. Approximately \$100,000 will be expended.

Several shipments of chrome are going out from the Washington district. The Red Ledge gold mine is producing large quantities of chrome, and the deposit lately opened on Poorman's creek by Peter and Robert Mummatelli has a 40-ton shipment prepared.

Nevada City, August 20.

#### PLUMAS COUNTY

(Special Correspondence.)—Under the management of Albert Burch of the Philadelphia Exploration Co., the Crescent and Green Mountain mines are being cleared of water to the 400-ft. level, and pumps have been provided. Both mines con-

tain gold-bearing quartz and formerly yielded well. They are near Crescent Mills.

Driving of a 550-ft. tunnel is progressing at the Pilot mine, in Genesee valley, to intersect the orebody at a depth of 280 ft. The vein is 6 ft. wide and carries gold, silver, and copper. It is operated by A. P. and J. W. Goodhue.

A deposit of manganese is being prospected in Dixie valley, near Greenville, by the Noble Electric Steel Co. It is near the Indian Valley railroad and some high-grade ore has been exposed.

The Gruss Mining Co., composed of the Gruss interests of San Francisco, has been formed to operate the Genesee, Little Genesee, North East Extension, and Mohawk properties, in the Genesee district.

The Billie Boy Mining Co., of Los Angeles, has taken under bond the Stover and MacKenzie gold-copper properties, two miles east of Lake Almanor. Driving of a cross-cut has begun. Some rich ore has been opened near surface.

Quincy, August 18.

#### SAN BERNARDINO COUNTY

(Special Correspondence.)—The discovery of platinum ore is announced as having been made on the 150-ft. level of the West End mine, at Cima. This property has been producing and shipping a large tonnage of lead ore, and it is thought probable that considerable platinum was unwittingly shipped before its presence was known. The platinum is said to occur with the lead carbonate. The best ore of this character assays: gold, 4.2 oz.; silver, 5 oz.; platinum-palladium, 7.61 oz.; lead, 47.5%. Copper is thus far absent from the ore, which fact it is thought will make the recovery of the platinum and associated metals easy. The ore occurs in a vein at the contact of limestone and granite.

Cima, August 11.

#### SHASTA COUNTY

(Special Correspondence.)—Fifteen electrolytic cells are in operation in the Mammoth Copper Co.'s zinc-plant at Kennett. The first carload shipment of zinc was made this week. A large amount of cadmium also has been produced.

The flotation plant of the Afterthought Copper Co. at Ingot is nearing completion. It is thought the mill will be ready for test about September 1.

Redding, August 16.

#### SISKIYOU COUNTY

(Special Correspondence.)—D. M. Watt, of Butte, Montana, and David D. Good, of Ashland, who have been developing the High Grade group of gold mines in the Stirling district on the south side of the Siskiyou mountains since early last spring, have closed down operations and returned to Ashland. This group was purchased by these operators last spring from James Hopwood of Ashland for \$10,000 cash after producing rich returns to the original locators. The present owners are expecting to close a deal for the purchase of the property for people of Butte.

W. F. Green of the Boorse, Green & Duck Copper Co. that has holdings in the Ike's gulch is expected in Happy Camp to begin development work on the company's holdings. These properties adjoin the Gray Eagle property on the north-west.

Charles Williams and G. Logan Brown are among the San Francisco mining men who have been examining mining properties in Happy Camp district.

Electric power equipment is being installed on the old Jitson mine near Hornbrook, the group being now known as the Hazel Mining Co.'s holdings. For some months a large force has been employed on the property preparing for development. It is reported that the present owners, with O. Jillson at the head, will spend \$100,000 to put this group in the producing list again.

Hornbrook, August 16.

**COLORADO****BOULDER COUNTY**

(Special Correspondence.)—James Maxwell, superintendent for the Tungsten Mountain Mines Co., reports a satisfactory season's work. The lessees are making a regular production of a good grade of ore. Development will be continued throughout the winter. The new machinery is giving good satisfaction. The new aerial tramway of the Mojave Boulder Co.'s tungsten mines is completed. At the Huron property, at Eldora, Woodring and Dupont are pushing work. This is one of the highest grade gold properties in Boulder county. Shipments soon will commence. There is now more mining and ore production in Eldora district than for several years past. The improvement is due principally to the smaller mines and the new enterprises that have started this season.

Eldora, August 14.

**SUMMIT COUNTY**

The American Metal Co. and the Molybdenum Products Corporation are opening extensive deposits of molybdenite near Climax, a station on the Colorado & Southern railroad at the summit of Fremont pass, at an altitude of 11,303 ft. There are 300 men employed in mining and construction work. These deposits have been known for years, but it is only recently that the demand and high price for molybdenite have encouraged the investment of the large capital necessary for the development and equipment of the mines. It is proposed to crush the ore and treat the pulp by flotation, reducing the volume from 65 to 1. The first mill will have a capacity of 250 tons daily. The deposits are on Bartlett mountain and in Ten Mile gulch.

**IDAHO****SHOSHONE COUNTY**

(Special Correspondence.)—The Federal Mining & Smelting Co., operating in the Coeur d'Alene and Wood River regions of Idaho, has declared its regular quarterly dividend of \$210,000, payable September 13. This makes the total for the year \$930,000, and the grand total to \$13,716,695 on the preferred stock. Payments on common stock aggregate \$2,708,750, making the total disbursements \$16,425,445.

The Tamarack & Custer Consolidated Mining Co. produced 3000 tons of crude lead and concentrating ore in July. The net value was \$50 per ton, or \$150,000. The net profits of the company for 1916 were \$338,746. More than 350 men are employed in the mine and mill.

The Hecla Mining Co. has declared its regular monthly dividend of \$150,000. This will raise the total of payments this year to \$1,200,000 and the grand total to \$8,505,000.

Spokane, August 15.

**MICHIGAN****HOUGHTON COUNTY**

(Special Correspondence.)—Wolverine showed a marked falling off in the percentage of refined copper secured from the ore during July, the pounds per ton being 14.112. In the first two weeks of August there has been a decided recovery, however, indicating an average for August close to the recovery for June, which was 16.516 lb. per ton. The refined output from the Wolverine for July was 363,888 lb. from 564,000 lb. of concentrate secured from 25,771 tons of ore.

The Mohawk produced 41,687 tons of copper ore during July, from which the stamp-mill produced 1,499,100 lb. concentrate and the smelter returned 970,538 lb. of refined copper.

Houghton, August 14.

**MONTANA****FERGUS COUNTY**

(Special Correspondence.)—A shortage of labor is inter-

fering with the development and operation of the mines of Fergus county. Many miners have been drafted and others have left to secure the higher wages paid in base-metal mining camps. At Kendall, the Barnes-King is producing about one-half of its usual tonnage. Lessees are working the old Kendall mine with a small force and assessment work is being done on several claims.

The Spotted Horse, Maginness, and Cumberland mines at Maiden are being successfully operated by lessees. A fresh inflow of water last week flooded the Cumberland, but the new pump has handled it and the workings are drained. Lewistown capitalists are planning the development of the War Eagle, on which a body of silver-lead ore carrying gold and zinc has been explored by an adit and cross-cut. Lewistown men are also financing the Nelson group, which has an excellent surface showing.—An adit is being driven on the Sutter group of claims on Armell's creek to strike the copper-bearing orebody in depth. Several carloads of copper carbonate was shipped from these claims last fall. Oswald Lehman has brought suit against the Sutters, claiming prior location of the claims. N. J. Littlejohn is re-opening the Mammoth property near Giltedge. Some of the tailing from the Gilt-edge mill is being re-treated in a small way by the cyanide process.

The Casofour plant of the U. S. Gypsum Co. is situated 10 miles east of Lewistown. The property is developed by two 500-ft. inclines. The inclines, surface cuts, and churn-drilling have shown that the gypsum bed averages 14 ft. thick, but only 8 ft. will be mined; the rest will be left for a roof, as the overlying rock is treacherous and would require much costly timbering. The property is awaiting the construction of a side-track and the arrival of construction material and machinery.

Progress is being made with the plant of the Three Forks Portland Cement Co., seven miles west of Lewistown. A 14,000-ft. aerial tramway is being installed by Leschen & Sons Co. and is nearing completion. This will bring limestone from the South Moccasin mountains. The Three Forks Co. has spent \$8000 on a road to the top of the South Moccasin to haul the tramway and crusher parts to the quarry. The heaviest parts weigh 20 tons. The tramway and cement-plant will be operated by electricity furnished by the Montana Power Co. There will be room for two kilns, but only one will be installed at present. This will be 285 ft. long. The cement will be made by the wet process. The plant will not be in operation before January 1.

A carload of lead-silver-copper ore has been shipped to East Helena from the Baker claims on Wolf creek in the Little Belt.

Lewistown, August 12.

**LEWIS AND CLARK COUNTY**

(Special Correspondence.)—Lewis and Clark county shows more activity and development than at any time in its history. The Drumlummon is again in operation, but by a new company. This change resulted from litigation in which the St. Louis Mining Co. was given, under a judgment, all of the holdings of the Drumlummon company, which included a mill, and the placer and quartz claims, under patent. The 25-stamp mill has been remodeled. The process used is continuous cyanidation. Electric power operates the machinery. The ore thus far milled is from the Drumlummon, taken through the Maskeline tunnel of that property. The stopes contain low-grade material that was left by the old company. The cyanide process has made it possible to work these ores at a profit. William Mayger, organizer of the St. Louis Mining Co., is in charge.

The Barnes-King company is operating the Shannon mine and the Piegan-Gloster group. The Shannon is comparatively a new mine, though the Piegan-Gloster was worked years ago.

In the Shannon a large body of low-grade ore exists in the upper levels. On the 500-ft. level an orebody has been opened that assays high in gold. Low-grade ore is coming from the Piegan-Gloster.

The Marysville Gold Mining Co. is developing a group of claims between Belmont and the Shannon mine, and high-grade ore has been uncovered in many places. The most extensive work is in the Blue Bird-Hickey adit. Duluth, Minnesota, interests are in control. A milling plant is to be built when the development warrants it.

At the Bald Butte mine, near Marysville, prospecting for new orebodies is in progress. The mine has not been a producer for some years. Bald Butte formerly paid \$1,500,000 in dividends. It has a complete milling plant.

Marysville, August 14.

## NEVADA

### HUMBOLDT COUNTY

(Special Correspondence.)—Surveys have been completed for an electric railway between the mines and mill of the Rochester Combined company. Construction of the mill building is proceeding rapidly and equipment is being placed in position. The drift from the Kromer shaft has discovered sulphide ore.

Connections have been established between the 800-ft. level and the Friedman adit of the Rochester mine by a raise, and all ore from the 800-ft. level and upper workings is dropped direct to the Friedman adit, and trammed to the mill. On the 800-ft. level the Adams orebody is from 15 to 24 ft. wide, all of good grade. The mill is treating 198 tons of ore per day. The July bullion output totaled \$55,355.

R. G. Gillespie, of Pittsburgh, Pennsylvania, has bought seven claims adjoining the Happy Jack group of the Rochester Combined from John Nones and William Merklinger. Rich silver ore is exposed. Gillespie operates the Monarch Consolidated property near Sierra City, California.

Arrangements have been made for an examination of the potash deposits recently discovered near Lovelock, and now under option to Chicago capitalists. If the examination proves satisfactory development will be started and a plant erected.

Rochester, August 19.

### NYE COUNTY

(Special Correspondence.)—The Tonopah Mining Co. last week produced 1450 tons of ore. The Extension shipped 35 bars worth \$63,500, which represents the bi-weekly clean-up. The ore production the past week was 2380 tons. On the 1440-ft. level of the Victor, the Murray vein shows a 10-ft. face.

The clean-up of the Tonopah Belmont mill consisted of 100,918 oz. of bullion valued at \$120,000, and 35 tons of concentrate valued at \$15,000. The plant at Millers shipped 47,234 oz. of bullion valued at \$49,000, and 25 tons of concentrate valued at \$10,000. The tonnage for the past week was 2634 tons.

The Rescue-Eula the past week produced 255 tons of ore.

Having finished the station work on the 900-ft. level of the Desert Queen, the Jim Butler is cross-cutting into the Ophir King. This mine sent 800 tons of ore to the Belmont mill at Millers the past week. The company earned \$297,863 net during the first six months of the year.

Tonopah, August 13.

## NEW MEXICO

### SOCORRO COUNTY

(Special Correspondence.)—A strike of high-grade ore has been made on the 1100-ft. level by the Socorro Mining & Milling Co. The drift has advanced 30 ft. in this ore. In the last half of July, 16,000 oz. of bullion was sent to the Mint. The Mogollon Mines Co. has cleaned up 13,000 oz. from the last two

weeks' run. A diamond-drill has arrived at the mine, and will be used to prospect the lower levels.

Regular shipments are being made to the custom-mill from the Maud S., Pacific, and Johnson mines. Work has been started on the Wiley group in the White Water district.

Mogollon, August 12.

## OREGON

### HARNEY COUNTY

(Special Correspondence.)—Lorenz, Lubbinga & Ebling are developing a copper property in the southern end of this county on the Red Horse claim of the Happy Chance group of 13 claims. They have uncovered 3% ore 400 ft. wide. The ore occurs principally in monzonite. There are dikes of amygdaloidal rock. On the Big Jag and Coppertown claims there is 300 ft. of 2½% ore. The ore is copper carbonate, occurring in the amygdaloid. On the Black Dike claim two shifts are cross-cutting a 60-ft. vein. The formation here is andesite. The ore on this claim is copper, glance, tetrahedrite, and nickel, similar to the ore of the Sudbury district of Ontario.

Fields, August 12.

### JOSEPHINE COUNTY

The placer mines in this district are shut-down until the rainy season. The Waldo copper mine shut-down August 6. It is reported a sale is pending and changes are to be made.

Waldo, August 8.

(Special Correspondence.)—During July 1600 tons of copper ore from the Waldo district passed over the branch road, 15 miles to Grants Pass, the nearest shipping point. This shipment was from the Queen of Bronze group, and the Pickett creek properties, owned and operated by the New York & Oregon Development Co. The wagon-haul from these properties is from 20 to 30 miles to the railroad. The ore went to the Tacoma smelter.

The chrome tonnage from the same district and over this road was 1200 tons. Shipments of chrome will be increased during August, as the new wagon road to the deposits was not completed until after the first week in July. The chrome shipments also require a long haul to the railroad. All of the shipping chrome deposits adjacent to this new wagon road are being operated by the United States Steel Co., shipments going to Pittsburgh, Pennsylvania.

Tucker and Fife, of Takilma, have taken a lease on the Cow Boy and Lytle copper claims and are shipping. These properties are controlled by the Queen of Bronze people. The ore runs from 10 to 36% copper, and the shipments amount to two carloads per week.

Collins McDougall, of Grants Pass, has taken a lease on the Meade gold prospect, situated on Jones creek, 5 miles east of Grants Pass. This is a free-milling mine, running \$5 per ton in gold. The vein is 12 ft. wide and has been prospected for 1200 ft. Mr. McDougall is negotiating for a 5-stamp mill to be operated by a gasoline engine. He expects to be able to crush 15 tons of ore per day.

The output of the Logan placer mines in Waldo district, which recently closed down for the season, amounts to \$40,000 in gold. The yield of platinum was said also to be large but the figures are not available. The mine is operated by George M. Esterly of Seattle. The water supply permits mining for 8 months of the year. The gold is very fine, and accompanied by platinum, also a little osmium and iridium. The deposit is from 10 to 25 ft. in depth. There are three ditches, the water from one being used in the elevator under a head of 325 ft., another is employed in two giants, and the third is used to clear away the tailing from the end of the sluice at the head of the elevator.

Grants Pass, August 9.

(Special Correspondence.)—Chrome mining is increasing near Adams station on the Crescent City-Grants Pass road.

A large group of chrome claims are owned or leased by R. J. Rowen, M. E. Young, and Geo. S. Barton, of Grants Pass, who are pushing development. About 40 adits on the veins have been started, in most of which chrome has been uncovered. The properties are on French hill, seven miles from the wagon road. It is planned to haul the ore by auto-trucks to Crescent City.

Mike G. Womack, of Medford, and M. A. Clark, of Ashland, are developing manganese, two and a half miles west of their recent manganese strike, 10 miles west of the Josephine caves on Buck peak. The ore assays 50% manganese. The nearest shipping point is 22 miles at Wilderville, on the Grants Pass-Crescent City railroad.

C. A. Winetrout has finished the installation of a gas engine to operate the Huntington mill on the Boswell mine three miles from Holland.

Grants Pass, July 25.

## SOUTH DAKOTA

### LAWRENCE COUNTY

The Homestake Mining Co. has declared its usual monthly dividend of \$65,000, payable August 20. Total paid to date \$43,786,234.

## WASHINGTON

### STEVENS COUNTY

(Special Correspondence.)—Operations in the magnesite properties at Chewelah and Valley, 50 miles north of Spokane, are in progress. Shipments of magnesite from Chewelah station aggregated 9450 tons in July. The net earnings were \$37,800 on a basis of \$4 net per ton of crude ore. The manufacturing department of the Northwest Magnesite Co. is about ready for operation. The investment represents \$260,000, including the buildings at Chewelah that cover five acres, the equipment, and a tramway connecting the manufactory and quarry, which are five miles apart. The plant will be used in the manufacture of magnesite specialties.

## Engineering Council

Subsequent to the organization meeting held on June 27, 1917, the Engineering Council has held two other meetings, one on July 13 and one on July 26. It has considered many matters of interest to engineers in general.

There have been appointed standing committees:

1. On Public Affairs: C. W. Baker, G. F. Swain, S. J. Jennings, and E. W. Rice, Jr.
2. On Rules: J. P. Channing, Clemens Herschel, N. A. Carle, and D. S. Jacobus.
3. On Finance: B. B. Thayer, I. E. Moulthrop, Calvert Townley, and Alex. C. Humphreys.

Many matters coming before the Council, both from the several founder societies and from the Council's predecessor, the Joint Conference Committee of National Engineering Societies, have been considered and referred to appropriate standing committees for investigation and report.

The Council has also created a War Inventions Committee comprising H. W. Buck, A. M. Greene, Jr., and E. B. Kirby, to co-operate with the Naval Advisory Board and other departments at Washington if desired in the promulgation to engineers of war problems now before the Government and for which there are opportunities for solution by means of inventions. It also created a committee comprising George J. Foran, E. B. Sturgis, A. S. McAllister, and A. D. Flinn, which is to collect and compile such information regarding engineers of the country as will enable the committee to co-operate with the different departments of the Federal Government on request and to assist in supplying the Government's need for engineering services.

## Personal

*Note: The Editor invites members of the profession to send particulars of their work and appointments. This information is interesting to our readers.*

F. L. SIZER is at Sutter Creek, California.

FRANK STOCK is in San Francisco from Cuba.

C. D. KAEDING was at Salt Lake City this week.

R. A. KINZIE has returned from Bishop, California.

GILMOUR E. BROWN has returned to Shanghai from Sumatra.

MORTON WEBBER will return to New York early in September.

H. J. MAGUIRE is now superintendent of the leaching-plant at Anaconda.

GEORGE A. TWEEDY has gone to Honduras to examine the Opetika mine.

EDWIN E. CHASE and his son will be at Jarbidge, Nevada, until September.

VICTOR C. ALDERSON has accepted the presidency of the Colorado School of Mines.

GUY C. RIDDELL is expected at New York in September on his return from Australia.

COREY C. BRAYTON is in Idaho, and will go to Utah before returning to San Francisco.

GEORGE S. YOUNG has left the Colorado School of Mines, and will reside in San Francisco.

B. H. MCLEOD, formerly in Mexico, has joined the Royal Flying Corps in the British Army.

H. W. ALDRICH is superintendent for the Ladysmith Smelting Corporation, at Ladysmith, B. C.

DRUMMOND MACGAVIN, now lieutenant in the Field Artillery, has gone to an Eastern military depot.

FRED. B. ELY, who has been in the officers training camp for three months, is now at Superior, Arizona.

ELLARD W. CARSON, manager of the Oceanic quicksilver mine, is examining properties in north-east Nevada.

E. M. RABB, superintendent of the Tom Reed mine, has returned to Oatman after a trip to mining districts in Colorado and Arizona.

HENRY M. PAYNE has moved to Pittsburgh on his appointment as assistant to the president of the Bertha and affiliated coal companies.

W. W. HENRY, superintendent of the Arps Copper Co., Shasta county, California, has been admitted to the second training camp for officers.

ROWLAND FEILDING, formerly in practice as a mining engineer, has been promoted to lieutenant-colonel in the British Army and awarded the D. S. O.

WALTER E. TRENT, president, and Dr. L. A. DESSAR, secretary-treasurer, of the Louisiana Consolidated Mining Co., are now at the mine in the Tybo district.

F. W. DENTON has resigned as manager for the Copper Range Co., becoming vice-president of the company. He is succeeded as manager by W. H. SCHACT.

G. H. COLEMAN is now superintendent for the Noble Electric Steel Co. at Heroult, California, relieving W. W. CLARK, who has held that position for nearly two years.

NATHAN H. JONES, engineer for the Spring Valley Water Co., at San Francisco, has received a commission as first lieutenant and is now at Vancouver Barracks, Washington.

BRAXTON BIGELOW, an American mining engineer, serving as captain in the engineer corps of the British Army, was wounded in a raid on the German lines on July 23 and is reported 'missing.'

# THE METAL MARKET

## METAL PRICES

San Francisco, August 21

Aluminum-dust (100-lb. lots), per lb.	\$1.00
Aluminum-dust (ton lots), per lb.	\$0.95
Antimony, cents per pound.	15.50-17.00
Electrolytic copper, cents per pound.	29.50
Pig lead, cents per pound.	12.25-12.50
Platinum, soft and hard metal, respectively, per ounce.	\$105-\$111
Quicksilver, per flask of 75 lb.	\$115
Spelter, cents per pound.	10.50
Tin, cents per pound.	60
Zinc-dust, cents per pound.	18

## ORE PRICES

San Francisco, August 21

Antimony, 45% metal, per unit.	\$1.20
Chromite, 40% and over, free SiO <sub>2</sub> limit 8%, f.o.b. California	\$0.55
Magnetite, crude, per ton.	\$8.00-10.00
Tungsten, 60% WO <sub>3</sub> , per unit.	\$22.00-25.00
Molybdenite, per unit for MoS <sub>2</sub> contained.	\$40.00-45.00
Manganese, Carnegie schedule less freight to Chicago. Less than 40% special quotation.	

Manganese prices and specifications, as per the quotations of the Carnegie Steel Co. schedule of prices per ton of 2240 lb. for domestic manganese ore delivered, freight prepaid, at Pittsburgh, Pa., or Chicago, Ill. For ore containing

	Per unit
Above 49% metallic manganese	\$1.00
46 to 49% metallic manganese	0.98
43 to 46% metallic manganese	0.95
40 to 43% metallic manganese	0.90

Prices are based on ore containing not more than 8% silica nor more than 0.2% phosphorus, and are subject to deductions as follows: (1) for each 1% in excess of 8% silica, a deduction of 15c. per ton, fractions in proportion; (2) for each 0.02% in excess of 0.2% phosphorus, a deduction of 2c. per unit of manganese per ton, fractions in proportion; (3) ore containing less than 40% manganese, or more than 12% silica, or 0.25% phosphorus, subject to acceptance or refusal at buyer's option; settlements based on analysis of sample dried at 212° F., the percentage of moisture in the sample as taken to be deducted from the weight. Prices are subject to change without notice unless specially agreed upon.

## EASTERN METAL MARKET

(By wire from New York)

August 21.—Copper is quiet, no movement in the market and quotations are unchanged, being at 28c. all week. Lead market is dull, prices being merely nominal at 10.87 to 10.75c. Zinc is dull at 8.75 to 8.62c. owing to there being no buyers. Platinum remains unchanged at \$105 for soft metal and \$111 for hard.

The Granby Consolidated Copper Co. of British Columbia, paid an August dividend of \$374,962 and has in cash and copper over \$3,000,000. The cost of production in June is stated to have been 9.3c. per lb., delivered at New York.

The 37th quarterly report of the Utah Copper Co., covering the second quarter of 1917, shows that the mills produced 56,403,465 lb. of copper, in addition to which 441,594 lb. was contained in ore shipped direct to the smelter, making a total production of 56,845,059 lb., as compared with 43,060,450 lb. in the previous quarter. The net profit during the period was \$10,563,541.11.

June	49.03	65.04	76.44	Dec.	55.34	75.70	78.92

The tendency of the silver market has been toward greater ease. Recent arrangements of the Indian Government have made supplies more accessible in London to meet the demand, which, apart from the requirements of the Indian Government, has been by no means heavy for some time past. The market, however, has been so sensitive that the price has often fluctuated with little apparent cause for movement. In these circumstances larger supplies will tend to restore normal conditions. On May 17 last attention was called to possible action on the part of the German Government to withdraw silver coins from currency. It is now decreed that two-mark pieces shall cease to be current from January 1, 1918, though accepted by the Government in exchange for paper currency up to July 1, 1918. The following detailed returns of the Indian currency show an increase in the silver-holding of 212 lacs. The total holding of 2431 lacs on July 22 last, compares with 2651 lacs held exactly a year before.

The stock in Bombay consists of 1700 bars, the same as reported last week. The stock in Shanghai on July 21, 1917, consisted of about 19,700,000 oz. in sycee and \$15,100,000, as compared with about 19,900,000 oz. in sycee and \$15,400,000 on July 14, 1917.

Quotations for bar silver per ounce standard, averaged 39.833 cash for July 20 to 26 inclusive.

## ORES

Tungsten: The position of tungsten has strengthened considerably in the past week, and the market has been correspondingly firm. No change can be made in quotations, which are \$25 per unit for high-grade wolframite, and \$22 to \$23.50 for material containing slight impurities. The arrivals during the week were small and the available stocks were not sufficient to take care of the inquiries. The domestic and foreign demand for ferro-tungsten is excellent, the prices quoted ranging from \$2.25 to \$2.50 per lb. of contained tungsten.

Molybdenum and antimony: There is no change in the quotations made last week of \$2.10 to \$2.20 per lb. of MoS<sub>2</sub> in 90% material, and the supplies are only nominal. Antimony ore has followed the trend of the metal market, and has declined slightly, sales having been made in the past week at \$2 per unit for high-grade material.

## Eastern Metal Market

New York, August 15.

Uncertainties as to the future, especially as regards the price-fixing policy of the Government, still continue to affect the metal markets, and prices remain practically nominal. Should a definite decision be reached regarding the price that will be paid for all the metal that will be purchased both for this country and the Allies, conditions would undoubtedly improve.

Copper is quiet and prices, which are nominal, remain unchanged.

Tin is dull.

Lead is very dull, but prices are firm.

Zinc prices are unchanged and the market is lifeless.

Antimony is quiet, with no change in prices.

Aluminum still continues inactive.

Increased orders for steel have been placed by the Government, and in spite of the embargoes, the export movement is large. Ordinary domestic business in iron and steel, however, is insignificant. Under pressure from some of its Allies the Government is hurrying its cost-inquiry, but the investigators are still some distance from the end of their work. Without taking a final position on the question of selling to the Allies at the same prices as the Government, steel manufacturers have accepted orders from officials at Washington this week for annealed wire and wire rods for Italy, the prices to be fixed after the Trade Commission's findings are made up. While the general question is in abeyance, it is understood that some steel interests have expressed a willingness to take business from the Government at a price to be fixed later, even though the material is for an Ally.

### COPPER

The market has been quiet during the week with no pressure to sell and no inclination on the part of purchasers to buy. The present dullness is attributed solely to the uncertainties of the Government's price-fixing policy. As was the case last week there has been considerable speculation as to the price that will eventually be determined by the Government. While 18c. per lb. has been talked of in the past few days, this is, however, pure conjecture, since no announcement has been made of the price that will be paid, nor is there any indication as to just how soon an official statement will be forthcoming. The market in both Lake and electrolytic is dull, with 28c., New York, the nominal quotation for both. Sales for last quarter have been made by some dealers at 25.50 to 27c., and some spot business at 29c. is also reported. The London quotations yesterday were unchanged at £137 for spot electrolytic, and £133 for futures.

### TIN

The throttling effect of price-fixing talk is apparent here also. Trading in tin is rendered more difficult by delays in the receipt of cables from London, due to the additional censorship on this side of the Atlantic. This, in conjunction with that already exercised by the English authorities, frequently causes a delay of several hours. Business for the day is often deferred until the daily cables are received, and sometimes this is late in the afternoon. Last week the market was quiet, coming to a halt on Friday, but Monday witnessed more activity for futures and a fair tonnage changed hands. Nobody is either willing or anxious to buy with the price-situation as it is, consumers, of course, being unwilling to purchase at the present quotations if there is a likelihood of a lower price being established later by the Government.

Considerable interest has been aroused by the report from Washington that, in return for the effort made by this Government to obtain the same prices for the Allies as it has paid, the European nations must, in turn, sell to the United States and to its consumers on the same basis. The effect of the adoption of such a policy by England would be to depress the price of tin. Off-grades have been in fair demand. The arrivals of tin up to August 13 were 1810 tons, and there were 4215 tons afloat from the Straits and the United Kingdom. The quotations yesterday, when inquiry was light and the sales correspondingly small, was 62.25c., New York, for spot Straits.

### LEAD

The Government requirements of lead for August, September, and October have been allotted to producers according to their capacity for supplying the metal. Unofficially the order is stated to be for 25,000 tons and the price paid, according to the same authority, was 8c. per lb., St. Louis. As is the case with the other metals no business is being transacted except under the spur of necessity. Despite this lack of sales the market remains firm at 10.87c., New York, although the leading interest has not reduced its quotation of 11c. per pound.

### ZINC

The Zinc Committee of the Council of National Defense last week opened bids for furnishing 11,500,000 lb. of grade C metal. While no official information has been made public as to the prices paid, it being the intention of the Government to maintain secrecy regarding the purchase of this lot of zinc, it is reported that the great majority of these bids was on the basis of 8.75c. per lb., St. Louis, with a small number at 9c., and that orders for the Government requirements will be placed at these figures. If these prices are correct, it would seem to show that the market is not as strong as was thought last week when bids of 9 to 9.50c., St. Louis, were generally talked of by the trade. A preliminary report on the production of zinc in the United States for the first half of 1917 has been issued by the Geological Survey. According to this report, which is based upon returns from producers of 99% of the total output, the production reached 364,000 net tons, an increase of 13,000 tons over the last half of 1916, and approximately 48,000 tons more than the corresponding period of last year. This output is about 75% of the total amount of zinc produced in the United States during the entire year of 1915. The stocks on hand July 1 are estimated at 33,000 tons, or nearly twice what they were at the beginning of the year. Fully 33,000 retorts, including 14 complete plants, were reported idle on June 30. The market continues sluggish, with no change in quotations from last week. These are nominally 8.50c., St. Louis, or 8.75c., New York, for prime Western for delivery any time before October 1, the prices for last quarter being  $\frac{1}{4}$ c. higher. Some business has been done for next year at even slightly higher figures.

### ANTIMONY

Chinese and Japanese grades are still to be had at 15 to 15.50c. per lb., New York, duty paid. The market is dull and sales are few in number.

### ALUMINUM

The quotation for No. 1 virgin metal, 98 to 99% pure, is unchanged at 50 to 52c. per lb., New York. There is little demand, and the market is not active.

## Company Reports

### OLD DOMINION

The Old Dominion Copper Co. for the year 1916 reports the ore extracted, 152,059 tons, containing an average of 5.88% copper. Mining cost was \$6.48. The company produced, including custom ore, 40,776,611 lb. of copper, 223,228 oz. silver, and 4097 oz. gold.

### ALASKA TREADWELL GOLD MINING CO.

The annual report of the Alaska Treadwell Gold Mining Co. for the year ended December 31, 1916, is as follows: operating cost for mining was \$0.862 per ton milled. Development to the amount of 4222 ft. was done during the year, and 539,940 tons was stoped. A total of 671,378 tons was crushed.

In the 240-stamp mill 217,070 tons was crushed, and in the 300-stamp mill 454,308 tons. The quantity of sulphurets saved was 4397.48 tons in the 240-mill, and 10,720.66 tons in the 300-mill. The cost of milling in the 240-mill was \$0.3993 per ton; and in the 300-mill \$0.3585 per ton. The total operating cost was \$1.3642 per ton, making a total cost of \$915,865.54. Minor construction costs amounted to \$688.81. The net profit on the year's operations was \$658,118.69.

Dividends, No. 115 and 116, paid during the year—5% on the par value of the stock—amounted to \$250,000.

### ALASKA MEXICAN GOLD MINING CO.

The annual report of the Alaska Mexican Gold Mining Co. for the year ended December 31, 1916, shows the following:

Mining development, 1050 ft., stoping 69,285 tons cost \$159,469.89, at the rate of \$0.9088 per ton. The mill crushed 175,476 tons, from which 4397.54 tons of concentrate was saved, at a cost of \$68,946.26, or \$0.3929 per ton of ore treated. The expense of treating concentrate was \$0.1371 per ton of ore milled, making a total cost for this branch of ore treatment of \$24,058.75. The total cost of mining, milling, and sundry minor expenses was at the rate of \$1.5123 per ton, making a total of \$665,366.97. The total operating cost, including a small construction charge, was \$265,402.97. The free-gold recovered from 175,476 tons of ore crushed was \$91,307.88, or at the rate of \$0.5204 per ton. Base and copper bars increased this amount by \$27,855.01. Concentrate treated, 4397.54 tons, yielded \$155,859.64, at the rate of \$0.8882 per ton of ore crushed. Total receipts from treatment of ore, \$275,022.53. Interest received, \$49,133.99. From other sources, \$6447.05. Total income from all sources, \$330,653.57. Net profit for the year, \$64,236.29. Carried forward from 1915, \$10,190.09. Total balance on hand, \$74,426.38.

### CORDOBA COPPER COMPANY

The report for the year ended December 31, 1916, shows a production of 1746 tons of blister copper, on which was realized £205,575 10s.2d. The working-costs amounted to £162,884 4s.9d., and the income tax absorbed £6064 5s. A dividend of 10% was declared. As a result of the installation of an improved Murex plant for treating the wet middling and slime a higher average extraction of copper was obtained. The combined recovery in the mill by wet concentration in combination with the Murex plant was 75.2% of the assay value of the ore. This is an improvement of 4.7% over the recovery for 1915. The reserve of ore at the end of the year was 142,914 tons, having an average content of 2.39% copper. The mines of the company are situated about 10 miles north-east from the city of Cordoba in Spain. Mining is conducted through four shafts ranging from 820 to 1550 ft. deep. There is in operation a smelter with converters, and the company

holds a lease upon a neighboring coal mine. The capitalization is £200,000 divided into 800,000 shares of 5s. each.

### UNITED STATES SMELTING, REFINING & MINING COMPANY

The eleventh annual report covering the year 1916 gives as the total net earning of all the companies held by the corporation, exclusive of deduction for depreciation, the sum of \$9,737,664.02. After deducting \$839,200 for depreciation and exploration the net profit was \$8,898,463.92, from which dividends on common stock of \$1,492,238.75 were declared. An undistributed surplus of \$12,957,454.96 was carried forward. The metals produced during the year, including those derived from custom ores and the output of the Mexican properties were as follows:

	Pounds	Average selling price, cents
Copper .....	28,838,093	27.297
Lead .....	103,855,451	6.676
Zinc .....	64,584,001	12.327
Silver, ounces .....	11,647,205	65.386
Gold, ounces .....	129,273	.....

At the Bingham mines improvements on the Niagara tunnel-level, including the installation of a pneumatic-haulage system, has been completed. The haulage-system has proved successful, and a similar installation has been made on the 400-ft. level, from the Galena shaft. The Niagara tunnel improvements have eliminated the necessity of operating the aerial tramway, and it has been dismantled and shipped to the Stowell mine in California. The Bingham mines of the company shipped during the year 109,586 tons of lead ore and 46,017 tons of copper ore. The Utah smelter at Midvale, Utah, has been enlarged by the installation of a seventh furnace, a magnetic separator, and a thaw-house. The magnetic separator is making good recoveries of pyritic material heretofore lost, and the thaw-house is used for thawing frozen ores. A Weatherby electric separator is being set up, and experiments are being conducted on the treatment of the mill-tailing by flotation. The zinc smelters acquired in Kansas during the year were in operation, but were handicapped by insufficiency of the supply of gas, and a new plant having a capacity of 200 tons per day was purchased at Checotah, Oklahoma. Exploration was continued at the Centennial-Eureka, in Utah, and 51,381 tons of lead ore was shipped. At the same point some work was done on the Bullion-Beck and the Champion properties, and a small production was made, mostly by lessees. The Mammoth copper mine in Shasta county, California, produced 244,445 tons of ore, of which 10,597 was zinc sorted from the copper ore. Other mines in Shasta county operated by the company are the Stowell, the Spread Eagle, Anderson, and Friday-Lowden. The smelter has been operated throughout the year, and has also treated a large tonnage derived from the Balaklala mine. The construction of a plant has been started to recover the metals in the bag-house fume which has been accumulating for some years. The chief feature of this plant consists of a plant for the electrolytic recovery of zinc. The refinery at Chrome, N. J., is being increased by an addition that will give 50% greater capacity. At the Gold Roads mine in Arizona, the ore on the lower levels proved to be too low in grade to admit of being mined at a profit, and the mill has been closed. Further development has revealed some promising orebodies. The Tennessee mine at Chloride, Arizona, is being worked to a depth of 1400 ft., and a winze is following the ore-shoot below that level. The Needles mill treated 47,570 tons of ore during the year. Operations at the Real del Monte y Pachuca, in Mexico, were on a reduced scale, due to lack of supplies. Exploration on the orebodies, however, continued with satisfactory results.

# INDUSTRIAL PROGRESS

*Information furnished by manufacturers*

## The Hoisting-Plant of the Johnetta Mine

The Johnetta Brick & Coal Co. is engaged in the manufacture of firebrick, turning out about 60,000 bricks per day. A seam of coal is being worked at a level 125 ft. below the floor of the tippie, and also an excellent grade of fireclay 125 ft. below the coal. At present the company is taking out 150 tons of fireclay and 250 tons of coal per day. Part of the coal is being used in the brick-kilns and the balance marketed. Considerable development work is being done in the coal vein and ultimately the capacity will be brought up to 420 tons per day.

The two photographs show the head-frame and tippie at the mine of the Johnetta Brick & Coal Co. at Johnetta, Pennsylvania, and the Lidgerwood shaft-hoist operating the same. This installation is typical of the smaller mines in the bituminous field in Pennsylvania and West Virginia.

The hoist was furnished by the Lidgerwood Manufacturing Co. It has a fixed drum, 60 in. diam. and 30-in. face, grooved to coil  $1\frac{1}{2}$  in. diam. rope, coiling on and off, operating a double-compartment shaft with cages in balance. The drum has a post-brake of the floating type, acting on a 71-in. brake-flange. The gearing is steel of the Falk herringbone type. The motor is the Westinghouse Electric & Mfg. Co.'s make, 100 hp. at 580 r.p.m., 3-phase, 60-cycle, 440-volts, alternating current; the armature-shaft being coupled to the pinion-shaft by a flexible coupling. The hoist is equipped with a safety-device, which cuts off the current and automatically applies the brake in case of

over-speeding or over-winding. The average duty of the hoist is 3450 lb. balanced load at 600 f.p.m., a maximum rope-pull of 7220 lb., and is built for a transverse stress of 10,580 lb. This electric hoist has now been in satisfactory operation for some time.

PLANT OF THE JOHNETTA BRICK & COAL CO. WHERE LIDGERWOOD HOISTS ARE IN USE

## The New Giant Ball-Mill

A new type of ball-mill has been introduced to the gold miners of California. The stamp-mill has been familiar to miners ever since quartz mining became an industry in California in 1851. Men with mechanical genius realized that much of the power required to operate a stamp-mill was virtually lost, and for years they have sought to make an improvement that would eliminate this waste of power. As a result of these efforts we have seen a long list of crushing and pulverizing devices in which the crushing and grinding was continuous, and not intermittent, as in the stamp-mill. Among these devices the most familiar are the various grinding-pans, the Huntington, Griffin, and Kinkead mills, representing the suspended muller type; the Bryan and Lane mills, representing the Chile mill, and the numerous ball and pebble-mills, of various sizes and forms. There are numerous other kinds of devices employed to crush and comminute ore, but the mill here illustrated is entirely unlike the ordinary ball-mill and is certainly unique in design and operation. It is known as the Giant ball-mill, and is interesting because of its novelty and its prompt appeal to the common sense of the

ENGINE ROOM OF THE JOHNETTA BRICK & COAL CO. MOTOR-DRIVEN HOIST

miner and millman, who usually recognizes what he considers a good thing when he sees it.

Realizing that he must first introduce the mill among the smaller mines, the inventor, O. A. Ellis, has made his mill in sections so that it may be transported to places difficult of access, and consequently the heaviest pieces may be taken into the mountains on pack-animals and set up on inexpensive foundations. There are few if any quartz-mills on the market today that can be so easily taken where wanted, so quickly assembled, and so promptly set to work as this Giant ball-mill. The mill is circular in shape, weighs approximately 5500 lb., and is 6 ft. in diameter. Around the outer part of the arrastra-like basin is a groove of chilled steel, and in this groove is placed seven balls of chilled iron of 16 in. diameter, each weighing, when new, 400 lb. There are neither shafts, boxes, nor bearings in this mill to require attention or to get out of order. Above the basin is a cover provided with an inverted

THE ELLIS GIANT BALL-MILL

groove similar to that below, and this upper groove rests on the balls in the groove. It is to this upper part of the mill that the power is applied. The maker claims that his mill requires but 10 hp. to operate it, that the capacity is about two tons per hour, and that this may be increased by speeding up the revolutions of the mill, though at a somewhat greater requirement of power. The mill is supplied with liners so that when worn the wearing parts may be renewed quickly. It is estimated that the wear of steel will be relatively small as compared with the stamp-mill.

The rock may be ground to any desired fineness, this being regulated by suitable screens. When it is desired to clean-up, the top is lifted off by means of chain-blocks, suspended from a timber frame above the mill, which makes the basin easily accessible for clean-up of amalgam, renewal of wearing parts, or for any other purpose.

The mill is driven by a horizontal belt that passes around the cylindrical upper part of the machine, power being supplied by steam, electric motor, gas engine, or direct water power where it is available.

The Ellis mill has been in operation for some months at the Chaparral mine, in Tuolumne county. A satisfactory demonstration of the mill was made at 211 Main street, San Francisco, on August 16, which was witnessed by a number of mining men.

A 50-ton Ellis ball Chile mill is being installed at the Early mine in Mariposa county, California. The management of this mill states that they are being sold as fast as they can be made. The Ellis mill is made in San Francisco, and notwithstanding the general shortage of metal, immediate delivery is guaranteed. The office of the Ellis Ball-Mill Co. is 429 Monadnock building, San Francisco, California.

## Take a Look at Your Scrap-Pile

Saving hundreds and even thousands of dollars every year through an analysis of the scrap-pile is not a theory, but may be seen at many of the larger machinery plants, factories, and mines of the country.

Now that the country is at war and all the departments of the Government are calling for conservation, plant owners are thinking twice before discarding a broken machine or a partly worn apparatus or tools of any kind. Through the various modern processes of welding, and especially through electrical and oxy-acetylene welding, machines, tools, and materials are re-claimed and put back to work earning profits, instead of being sold to the junk-man for old iron.

The oxy-acetylene process being simple and comparatively inexpensive to install and operate, has found much favor with plants for conserving machinery and material. It makes possible repair jobs never dreamed of a few years ago. The present high prices for raw material, coupled with the inability to get new machinery within a reasonable time, has sent plant owners scurrying for new processes that will help them keep the profits on the right side of the ledger.

An Eastern plant that uses many tools, found one day the scrap-pile filled with disabled tools that represented thousands of dollars in lost profits. Reclamation was begun. Workmen were instructed to return all broken tools of whatever character to the storekeeper. The tools were then turned over to a machinist who passed on whether or not it would be profitable to reclaim them. As a rule it was found that by welding or filling in, repairs could be easily and quickly made at a small cost.

Under the oxy-acetylene process, for example, the combination of oxygen and acetylene produces a heat of 6300° F., and fuses two pieces of

metal, invariably leaving the weld as perfect and strong as the other parts.

The advantage of either the electric or oxy-acetylene processes is that the welding can be done often with the broken parts in place, without dismantling the machine, thus saving valuable time and much extra labor.

An automobile manufacturer in a Middle-West city found there was a big leak in the making of certain castings, through many castings with only minor defects being thrown aside as worthless. These losses were overcome by oxy-acetylene welding, used to fill up slight holes and in building up parts thinned by careless pouring, all at a cost much less than re-melting and re-casting.

One concern manufacturing chain-belts was handicapped in delivering a rush order because a careless workman, in the roughing of some large links preparatory to rounding them, took off too much in the rough cut of a number of pieces of the bar-steel. As time would be lost in getting a new shipment of steel the oxy-acetylene process was employed and in a few hours the ruined links were built up again and made perfect.

Another small firm uses the process in filling up gas blow-holes in castings, as well as remedying shrinkages and other imperfections. An automobile manufacturer rescued a large number of housings for gear-shifts which were filled with pin-holes. The holes were filled by adding metal under the oxy-acetylene flame which fused the new metal with the old and made a perfect job. To spoil or damage a nearly completed piece of work costs money and where it can be made over at slight cost, means the plugging of another leak.

Further information and data on the conservation of materials by the use of the oxy-acetylene blow-pipe will be supplied by the Prest-O-Lite Co., Indianapolis, Indiana.

### EDITORIAL

NOTES .....	297
-------------	-----

THE I. W. W. AND BUTTE.....	299
Report of Harris Weinstock on the principles of the I. W. W.; is the I. W. W. socialistic or anarchistic? Lawlessness always anti-social, even when committed ostensibly to protect society; unions show lack of good faith; need of reforming court procedure. M. & S. P., September 1, 1917.	

THE FOOD LAW AS A PRICE REGULATOR.....	300
Frank A. Vanderlip on inflation; not fiat money but credits inflated by unearned irrational profits; scope of the 'food bill'; may be expanded by interpretation to include general regulation of prices; financial difficulties certain to follow partly regulated industry. M. & S. P., September 1, 1917.	

### DISCUSSION

SAMPLING LARGE LOW-GRADE OREBODIES.....	301
By R. E. Raymond .....	
Sampling never undertaken in south-western Missouri base-metal deposits; drill-cores never assayed; drilling is merely to show extension of the orebodies. M. & S. P., September 1, 1917.	

STEEL ON THE PACIFIC COAST.....	301
By W. H. Whittier .....	
Bulletin of the University of Washington on iron ores of the North-West; favorable conditions on the Pacific Coast for making electric steel. M. & S. P., September 1, 1917.	

MILL-TESTS V. HAND-SAMPLING.....	301
By E. P. Spalding .....	
'Mill-test zones' in mine-sampling; danger of over-mixing samples. M. & S. P., September 1, 1917.	

SOLUBILITY OF TUNGSTEN MINERALS.....	302
By J. Coggin Brown .....	
Wolfram in the Tavoy district of Burma; the wolframite readily dissolves; never concentrates in placers; association with sulphides significant; paragenesis of the Tavoy tungsten. M. & S. P., September 1, 1917.	

THE EXTRA-LATERAL RIGHT.....	303
By Albert Burch .....	
Evils of following legal precedent closely in legislation; principle of discovery must be abandoned if extra-lateral right is abolished; discovery of ore in future depends chiefly on following geologic indications; expenditures made by mining companies to avert litigation over apex-rights. M. & S. P., September 1, 1917.	

### ARTICLES

THE LABOR TROUBLES AT BUTTE.....	305
By An Occasional Correspondent.....	
History of the difficulties with the Butte labor unions; B. M. & W. U. warns members against violence; unfair attitude of the Butte newspapers; lynching of Frank H. Little; speech of Miss Jeannette Rankin. M. & S. P., September 1, 1917.	

MINING AND SMELTING COPPER ORE AT KALATA.....	309
By F. W. Draper .....	
Kalata 145 miles north of Kyshtim; ores are heavy sulphides; copper content 2.3%; depth of shaft 770 ft.; blast-furnace practice; power-plant supplies 1100 kw., developed by Brown-Boveri turbo-generators. M. & S. P., September 1, 1917.	

METALLURGY OF LEAD IN LOWER MISSISSIPPI VALLEY.....	315
By Herman Garlicks .....	
Outline of early methods; the 'ash' furnace; introduction of the Pilz and Raschette blast-furnaces; sintering methods; Dwight-Lloyd and Hunt-Heberlein methods; mechanical hearth for high-grade concentrate; de-silverizing at Herculaneum and Collinsville. M. & S. P., September 1, 1917.	

A SWITCH-TONGUE .....	317
M. & S. P., September 1, 1917.	

MODERN MILLING METHODS APPLIED TO CALIFORNIAN GOLD ORES.....	318
By Alex McLaren .....	
Typical Mother Lode gold mill; mill of Krormick Mining Co.; comparison of concentration on vanners and the Senn pan-motion machine. M. & S. P., September 1, 1917.	

CALIFORNIA MINES IN 1917 .....	320
Increased cost of gold production; impounding tailing; renewed activity in hydraulic mining; review of operations in different counties. M. & S. P., September 1, 1917.	

ADVANCE IN ELECTRIC-STEEL PRODUCTION.....	321
Output in the United States has grown from 70,000 tons in 1915 to a rate of 300,000 tons per year. M. & S. P., September 1, 1917.

## Building Bigger Business by Better Methods

*G-E Equipment is reliable and economical*

**W**HEN you cut down manufacturing costs—up go your profits. When you increase your production—when you increase the quality of your products—when you decrease spoilage—up go your profits.

When you make it easier for an employee to produce more, you make it easier for him to *earn* more; and you find it easier to get the *better kind* of help and much easier to *keep* them. And up go your profits.

When you cut down your power costs, when you cut down maintenance of plant—when you reduce

overhead supervision—when you lessen breakage of machinery—when you reduce stoppage of machinery—these mean *more profits*.

These advantages and a greatly increased capacity for service to your customers come to plants equipped with G-E Motor Drive.

We will gladly send a member of our Engineering Organization who will study the requirements and conditions of your plant, and tell you how, where and why G-E Motor Drive will give you manufacturing advantages.

# EDITORIAL

T. A. RICKARD, Editor

**W**E take pleasure in announcing that Mr. George J. Young, lately professor of metallurgy in the Colorado School of Mines and formerly professor of mining in the Nevada School of Mines, has joined our staff as assistant editor.

**I**T is announced that the Miami Copper Company will not file a petition for the writ of certiorari required in order to appeal from the Appellate Court to the Supreme Court of the United States. Another course of procedure will be adopted.

**A**MONG the effects of the War is a great demand for bibles. We are glad of that, not only for moral and ethical reasons, but because of the opportunity given to learn good English. If our mining engineers and metallurgists would read the Bible their style in writing might be improved.

**S**HIPMENTS of scrap-metal have proved an embarrassment in the operation of the railroads in consequence of the large amount of rolling-stock involved. On recommendation from the Council of National Defense many railroads now decline to accept such shipments until evidence of acceptance by responsible buyers has been presented.

**J**UDGE BOURQUIN of the District Court at Butte has decided in favor of Minerals Separation in the suit against the Butte & Superior Mining Company for infringement of patent. We shall publish the text of the decision as soon as it reaches us. Meanwhile we look forward to attending the trial of this case when it is heard on appeal before the U. S. Court of Appeals of the Ninth Circuit in San Francisco.

**S**YMPHONY concerts are to be held as usual in San Francisco and the entry for the golf tournament at Monterey is unusually large. A year hence we shall be ashamed to remember either the concerts or the golf tournament. Any man having the health, strength, time, and money to qualify him for a golf championship ought to be engaged in a nobler occupation at this time. To spend money on symphonies when thousands of innocent victims are dying of destitution is a heedless stupidity.

**L**ABOR-UNIONS are criticized for their persistent objection to incorporating themselves and thereby assuming legal responsibility for their acts. This recalls the fact frequently stated by broad-minded lawyers that the chief cause for the failure of justice in the courts is

found in the complex trivialities of the rules of procedure, and the lack of a fundamental code. The legal trickster is able to take advantage of petty technicalities to discomfit the poor man that resorts to the law. The first practical step toward social reform is to restore confidence in the tribunals of justice, and that means to take them out of politics.

**W**E have received a pamphlet issued by the Mellon Institute, in the University of Pittsburgh, giving the text of the two opinions rendered in the U. S. Circuit Court of Appeals in the Miami case. The pamphlet is distinguished by an introduction written by Mr. Raymond F. Bacon, Director of the Institute, in which he dwells upon the importance of the litigation over the flotation patents and lays stress upon an understanding of the legal status of the processes involved. What interests us most, however, is his statement that Judge Buffington's minority opinion commends itself to mining engineers as being a fairer statement of the case than the majority opinion of Judge Woolley. Dr. Bacon says: "Having spent some years in the study of ore-flotation processes and the literature upon the subject, it is my personal opinion that the minority opinion of the Court is more closely in accord with the facts as mining engineers see them, and it should be sustained. I am able to say that all of a large number of neutral mining engineers with whom I have talked have expressed the same view." With this we concur.

**T**HE editor of this paper is a member of a committee, of which Mr. James H. Collins is chairman, to assist in arousing the interest and support of the trade and technical press, and more particularly of their readers, in the effort to economize food under the leadership of Mr. Hoover, who has been appointed by the President to direct the organization created for that purpose. In our issue of August 18 we quoted the food-saving pledge in these columns and we reproduced it on an advertising page, so that any reader willing to sign it could cut it out without mutilating the reading-pages. The pledge will be found in this issue on page 30 of the advertising supplement. Please sign it and ask others to sign a similar pledge. You might also make copies of it and distribute them among your friends. When signed, send them either to us or direct to Mr. Hoover at Washington. The MINING AND SCIENTIFIC PRESS is read, we are glad to think, by the wives of many of the members of our profession. We appeal to them to co-operate in this patriotic work. General Pershing has said that the War will not be won by talking or by subscribing to the Red

Cross; it will be won by our soldiers on the field of battle and by our sailors on the sea; but our gallant men depend upon us to supply them with food and munitions, and our gallant Allies look to us to assist them in making good the shortage of food-stuffs due to the ravages of war. Those that cannot fight—the women and the men either too young or too old, even the children—can all help in so saving food that there will be plenty for those immediately affected by the destructiveness of war. Let us unite in this good work. It is a small service compared to that rendered by the brave men that go to the front, and we should be ashamed not to perform it enthusiastically and efficiently.

**THE STATEMENT** by Mr. W. H. Whittier, appearing on another page of this issue, emphasizing the peculiar advantages possessed by California for manufacturing electric steel and ferro-alloys, should serve to spur public insistence for a wiser policy in the administration of American, including Western, water-powers. The available energy in California, Oregon, and Washington is equalled only by Norway and Sweden, where Government supervision renders it possible to obtain rates equivalent to \$6 per horse-power year. The growth of electric-steel production in this country is enormous, and the output is highly desired because of its superiority. The West Coast should take advantage of its marvelous water-power and develop a great steel industry, but in order to do this rates must come down and more hydro-electric projects must be undertaken. The Pacific Electro-Metals Company is now struggling to obtain a rational rate for its works at Bay Point, near San Francisco, where 10,000 horse-power will be required in the manufacture of ferro-alloys. This is a mere hint of the magnitude of the metallurgical operations that would be started under favorable regulations ensuring cheap electric current.

**DANIEL GUGGENHEIM** has allowed himself to be interviewed on the price of silver. He predicts a further rise in the quotation to \$1 per ounce. Incidentally he mentioned the cessation of production in central Europe as a reason for the scarcity of the metal. Writing in the *Gerard*, or *Tammany-Hearst*, style we would say that "as a rule, no large amount of silver is produced in central Europe. Of course, silver is very valuable and any large mines, in consequence, would be controlled by the Yunkers, who are Prussian squires, usually counts of many quarterings. As a matter of fact, most of the silver credited to German production is obtained from Australian ore which is smelted by skillful professors from Freiberg. These metallurgists are hard workers and refuse to drink beer until the silver in the cupel has brightened. This important stage of the process, as a rule, of course, is marked by the fact that the noble technicians acquire a noble thirst, which they alleviate out of mugs made, naturally, out of the silver they produce. This is another reason for the scarcity of silver in

the German empire, which was founded by the Elector of Brandenburg many years ago." We commend this valuable information to Mr. Guggenheim's attention. Meanwhile we may be permitted to state that in normal times the production of silver in Germany is about 15,000,000 ounces and that of Austria-Hungary 2,000,000 ounces. The larger part of the German production is won from foreign ores, notably the zinc-lead concentrate shipped from Broken Hill for treatment in Rhenish Prussia, so that the total domestic yield of silver in the two enemy-countries is not more than 10,000,000 ounces out of a world production of 250,000,000 ounces. Apparently, therefore, the interruption of mining in central Europe is not an important factor in accentuating the demand for silver.

**IT** is interesting to receive confirmation from India of our contention that wolframite is a readily soluble mineral in the zone of oxidation, and that its persistence among the minerals in an outcrop is determined by its associates. If enclosed in quartz, so that the solutions from the decomposing soil cannot attack it, wolframite will remain until erosion exposes it to the atmosphere. Under these conditions it will sometimes endure for ages. Its stability even then is apparently the result of the accident of superior purity, and is due particularly to the absence of iron sulphide. This compound is commonly present and aids in the decomposition of the wolframite. Mr. J. Coggin Brown, in a letter published on another page of this issue, writes that the conditions found in the rainy tropics yield results like those observed in the tungsten deposits of the United States. Also he finds that it is equally true in Burma that wolframite disintegrates in the detritus from the lodes, yielding soluble compounds that leach so rapidly as to preclude the formation of wolfram placers. The same is true of molybdenite, which is generally regarded as resistant to the influences of weathering. On exposure to the air it persists in a manner that gives it another point of resemblance to graphite. It is not directly attacked by alkalis, but in the process of soil disintegration, under the influence of which everything must pass that finally becomes concentrated into a placer, it undergoes complete oxidation. This is not, as some think, because it is carried away by the current when saturation during the seasons of excessive rainfall imparts mobility to the gravel. Whatever may happen to individual flakes, molybdenite as a whole, when contributed by erosion to the alluvial wash of a district, is first oxidized and then dissolved and leached. The process may be studied in the lodes at many points in the high mountains of California and Oregon, and in Ontario, where molybdenite deposits occur under similar climatic conditions. This leads to the further observation that the products of decomposition of vegetal matter play an important part in the solution of minerals in vein-outcrops. The effects in outcrops are frequently analogous to those happening to the same minerals in the soil. The zone of katamorphism possesses a 'grass-root' phase that

is perhaps more significant than has been realized. The disintegrating agents are many and infinitely complex compared with those operative at a relatively shallow depth where the quantity of organic substances becomes small.

## The I. W. W. and Butte

Some light is thrown on the purpose of this organization by a report made by Mr. Harris Weinstock in 1912 to the Governor of California. The I. W. W. had been making life unbearable to the citizens of San Diego and had exasperated many of them to the point of organizing a counter-irritant, a company of vigilantes, who took the law into their own hands and perpetrated outrages hardly less reprehensible than the ones that they were intended to check. The Governor appointed Mr. Weinstock to investigate. He appears to have discharged his task in a fair-minded way and for that reason his statements are worthy of respect. After examining a number of pamphlets issued under the I. W. W. stamp, he concluded that this anti-social organization teaches and preaches the following:

1. That workmen are to use any and all tactics that will get the results sought with the least possible expenditure of time and energy.

2. The question of right or wrong is not to be considered.

3. The avenging sword is to be unsheathed with all hearts resolved for victory or death.

4. The workman is to help himself when the proper time comes.

5. No agreement with an employer of labor is to be considered by the worker as sacred or inviolable.

6. The worker is to produce inferior goods and kill time in getting tools repaired and in attending to repair-work, all by a silent understanding.

7. The worker is to look forward to the day when he will confiscate the factories and drive out the owners.

8. The worker is to get ready to cause national industrial paralysis with a view to confiscating all industries, meanwhile taking forcible possession of all things that he may need.

9. Strikers are to disobey and to treat with contempt all judicial injunctions.

Mr. Weinstock says that the members of the I. W. W. are not anarchists because they stand for a "co-operative commonwealth." This is funny. To divert such a kindly social term as "co-operative commonwealth" to the characterization of the I. W. W. nightmare is ludicrous. Co-operation involves the surrender of personal privilege, not an insistence upon rampant individualism. Mr. Weinstock says that "if all men and women were . . . to follow their teachings . . . it would simply mean a nation of thieves, liars, and scoundrels." A stronger term might be used for Vincent St. John, responsible for the assassination of Arthur Collins at Telluride in 1903 and now the general secretary of the I.

W. W. organization, and for other men identified with the murders and brutalities of the strikes in the Coeur d'Alene and Cripple Creek, such as William D. Haywood, also one of the leaders of these anarchists. It is revolting to the mining engineer to recall for how many years such men at St. John, Haywood, and Moyer have been prominent in making trouble not only in an economic way—for that there is justification—but by inciting men to crime. To return to Mr. Weinstock; he describes how the people of San Diego, inflamed by an irresponsible press, took the law into their own hands, organized a vigilante movement, kidnapped a number of the I. W. W., and subjected them to indignities and cruelties before driving them out of the county. He condemns this lawlessness properly: "It cannot now be said . . . that there was any justification whatever on the part of men professing to be law-abiding citizens themselves to become law-breakers and to violate the most sacred provisions of the constitution." Again he says: "Who are the real anarchists . . . these so-called unfortunate members of 'the scum of the earth' or these presumably respectable members of society?" Similarly, in her recent speech at Butte, Miss Jeanette Rankin referred to the lynching of Frank Little and expressed entire lack of sympathy with both the victim and the murderers. "Lawlessness has no place in organized society," she declared. It is well that a woman should utter this truism. We go further and say that when the law is broken by "respectable members of society" and by men of education they must bear a bigger blame than the ignorant and perverted disturbers of the peace on whom they lay violent hands. So also the briber is worse than the man bribed—we have in mind municipal corruption—because the giver of the bribe usually has a better understanding of the baseness of the act than the receiver. Education has its responsibilities. According to the little Congresswoman it is the 'rustling-card' more than the question of wages that has driven the men at Anaconda to strike. The facts are made clear in the article from our correspondent at Butte appearing on another page. It shows a spirit of fairness throughout and is well worthy a careful reading. Since that article was written the smelter-men at Anaconda have gone on strike and both the Washoe and Great Falls smelting plants have ceased operations. That will compel the closing of many mines and cause 15,000 men to stop work. This action of the Mill and Smeltermen's Union at Anaconda is due to the radical element and represents a repudiation of the agreement made by the union a few days earlier. Here is one of the great obstacles to the recognition of the unions: their bad faith and their lack of any such legal status as would permit action against them. Thus industrial anarchy ensues, and coming as it does at a time of national crisis, it is to be hoped that a Federal investigation will be made without further delay. Miss Rankin said: "War spells sacrifice. No one can escape its far-reaching effects," and so forth. How hollow it must have sounded at Butte. She spoke of the men "whose patriotism causes

them to continue to work under conditions that they are daily unnecessarily risking their lives." The less said about patriotism the better. This applies to the other side also, whose patriotism causes them to refuse to sell copper at less than 25 cents per pound when the average price for ten years has been 16.67 cents. One reason for the cat-and-dog fight between capital and labor is indicated by our Butte correspondent, who states that the local press has aggravated the antagonism between the mining companies and their employees by misrepresenting the facts in a malicious manner. That, of course, is one of the underlying causes of social unrest. A sense of justice cannot be developed so long as the press is subservient to either side.

## The Food Law as a Price Regulator

Press reports of the recent address by Mr. Frank A. Vanderlip at Chicago did not make clear what he meant by the word 'inflation'. He predicted financial hardship as a result of it, and indicated that the absorption of the railroads by the Government seemed inevitable. As no issues of inconvertible paper money have been made, we here confront a new use of the term; it is not inflation of currency, but an inflated face-value of credits that is already beginning to react on the price-boosters. They are trading in profits, not in the true values of goods delivered. The steel-makers, the copper-producers, the lead trust, and a long list besides, are uncurbed in their efforts to pile up vast credits in the hope that they will be valid without contraction in the days to come when prices of commodities must shrink to a level comparable with average incomes. The railroads, however, are not free to take all that the traffic will bear; they find themselves between the devil of greedy capital, unwilling to divide profits with them, and the deep sea of popular distrust, which will not sanction an increase in rates. This is one phase of the difficulty. Another is the restriction upon food-prices; and yet another the action being taken by the Government to control the prices and deliveries of fuel in order that the people may not freeze next winter and that industry may not be crippled. The rule given by Congress in the 'food bill' is not one for universal application; it singles out specific things, which it calls "necessaries", and in so doing it may work a seeming injustice upon many industries. An all-inclusive measure would have been better; it would be no more difficult to establish bases for equitably adjusting the prices of all commodities than to interpret wisely the extent to which the classification given in the statute might be applied. The words of the law, defining its purpose, are: "to assure an adequate supply and equitable distribution, and to facilitate the movement of foods, feeds, fuel, including fuel-oil and natural gas, and fertilizer and fertilizer ingredients, tools, utensils, implements, machinery, and equipment required for the actual production of foods, feeds, and fuel, hereafter in this act called necessities".

In Section 12 the statute authorizes the President when "necessary to secure an adequate supply of necessities for the support of the Army or the maintenance of the Navy, or for any public use connected with the common defense," to take over and to operate "any factory, packing-house, oil pipe-line, mine, or other plant or any part thereof, in or through which any necessities are or may be manufactured, produced, prepared, or mined." As this is a war measure it is unlikely that resistance to its operation could be made by injunction, or that a case arising under it could be decided by the Supreme Court in time to test its constitutionality before the occasion that called it into being fortunately had passed into history. Nevertheless, we feel that it might fairly be questioned whether the text makes "necessaries" include more than "foods, feeds, and fuel." This view has been taken with hilarious gusto by a large number of prominent gentlemen who claim exemption for their purses as well as for their sons. It opens the way to play politics; it invites the unwholesome practice of using 'influence' in the sinister and corrupt sense of the word; it tends to introduce into our administration the evils of bureaucracy. Exemptions by special favor should be made impossible in a republic. In this respect the Food Bill fails most dismally.

It was not our purpose to criticize the food law, because we are duly thankful for any measure with which the Government may set to work effectively in the solution of its mighty problems. Some way will be found to extend it, as circumstances require, for the salvation of the country. The thing that does concern us, however, is the inevitable unfairness that will result, in consequence of which the evils of inflation will be felt in many industries. Regulated businesses will be at the mercy of the unregulated. Their own costs will be inflated with the profit-gas of the free producers through the purchase of supplies. They will not be able to increase wages nor to distribute compensating bonuses. The effect is certain to be disturbing, not alone to finance, but to an already aggravated labor situation. We cannot afford to add to the hardships of those that bear the brunt of industry. We hope the Administration will realize the importance of equalizing the opportunity for every kind of economic effort, and that it will not hesitate to read authority into the statute to bring all industry under control through the regulation of prices. It is a wiser way than to attempt an adjustment through the excess-profits tax. The padding of costs will defy Government scrutiny, and the wrinkles will not be smoothed out; big business will find ways for paying a lesser proportion of its actual profit. The War Industries Board seems to be taking steps to meet the threatened difficulty, and we quote approvingly its recent announcement that a just price means one that "will sustain the industries concerned in a high state of efficiency, provide a living for those who conduct them, enable them to pay good wages, and make possible expansions of their enterprises which will from time to time become necessary as the stupendous undertakings of this great War develop."

# DISCUSSION

*Our readers are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy. The Editor welcomes expressions of views contrary to his own, believing that careful criticism is more valuable than casual compliment.*

## Sampling Large Low-Grade Orebodies

The Editor:

Sir—I have read with considerable interest your editorial of May 26, and the following contributions by Messrs. T. H. Leggett, Morton Webber, and Albert Burch.

I do not know that Mr. Leggett is right in stating that the mine that cannot be sampled "is a good mine—for the owner to keep," nor is Mr. Burch exactly right while agreeing with Mr. Webber but qualifying what he says that such mines are "freaks" and unimportant. I have had several years experience in both the South-Eastern and South-Western base-metal fields of Missouri. I can safely say that sampling is never undertaken in the underground operations of these mines, which are among the most important lead and zinc producers of the world. That surface drilling is done is true, but the cores are never assayed. Drilling is done to demonstrate the extension of the profitable beds; and the underground development that follows depends solely on ocular observation. This may seem strange, but new-comers who have gone into the field and started underground sampling found they were being misled and drifted into the method found by experience to be the best.

In Mr. Webber's article on the subject entitled 'Latent errors in mine sampling' he refers to this field as belonging to his class five, and I notice the views of H. C. Hoover are also in agreement with Mr. Webber as to the classification of this district.

R. E. RAYMOND.

## Steel on the Pacific Coast

The Editor:

Sir—The article on the 'Outlook for Iron and Steel on the Pacific Coast' by Ernest A. Hersam in your issue of July 28 was read with a great deal of interest by the writer, as was also the editorial 'Steel on the Pacific Coast.' This subject is claiming considerable attention in the West and is particularly interesting to me because I just recently completed a year's research work on the iron ores of the North-West at the University of Washington under the direction of the Bureau of Industrial Research of that institution. The work was taken up with the idea in mind of determining, if possible, the feasibility of establishing a steel industry on the Pacific Coast. In order to arrive at any conclusions in this regard it was necessary to investigate the ores themselves,

fuel, fluxes, and labor, markets and transportation, and costs of production. The results of this work form the subject matter of 'An Investigation of the Iron Ores of the North-West' which is now in the hands of the printer and is being published by the Bureau of Industrial Research of the University of Washington.

Mr. Hersam's article is well written and shows the result of considerable thought and study. There is one point, however, which is not brought out that I believe should be emphasized. That is the superior quality of iron and steel and ferro-alloys manufactured in the electric furnace. This finer quality of product demands higher prices and of course enables the electric furnace to produce at a higher cost than an open-hearth or blast-furnace. It is said that conditions on the Pacific Coast relative to electrothermic smelting and refining are more nearly parallel to those of Sweden and Norway than are those in any other country. It would seem that this is a phase of the subject of iron and steel that deserves more investigation on the Pacific Coast.

W. H. WHITTIER.

Ray, Arizona, July 31.

## Mill-Tests v. Hand-Sampling

The Editor:

Sir—I have read with great interest the article by Morton Webber published in your issue of July 28, entitled 'Mill-Tests v. Hand-Sampling' in valuing mines, together with the discussion by Albert Burch published in the same issue.

Knowing something personally of Mr. Webber's methods and the thoroughness of his work, and having a high regard for his ability, it occurs to me that he makes two points of fundamental importance with reference to correct mine-valuation that should be elucidated more clearly and in greater detail. I refer especially to his remarks concerning "Pre-determined foot-weight of the stopes as a basis for mill-test", which to me, and I presume to many other engineers, is somewhat novel and lends itself to considerable enlargement. Also I refer to the last paragraph of his article wherein he suggests a "division of the area under examination into mill-test zones." It seems to me this point is provocative of much thought, and I suggest that a more detailed scheme of this point would be of decided and general interest to your readers, and especially to those interested in mine-valuation.

It is a trite saying, of course, that each mine or ore-body is a problem unto itself and a proper solution of

each individual problem of valuation should be based upon regional and local characteristics, and not upon general or typical characteristics, as is too often the case. All orebodies have not only a developed but a prospective value, and this is a proper element for consideration in valuation. How far and to what extent the prospective element is entitled to consideration depends upon what I term regional and local characteristics, the proper judgment of which introduces the personal element. I should be glad to have the experience and judgment of Mr. Webber and others on this point, and believe it would be of general interest, especially as applying to properties of meager or incomplete development.

I quite agree with Mr. Webber that a rule-of-thumb method of mine-valuation will not apply generally and that terms and conditions of purchase will frequently, and should properly, govern methods of examination. I do not, however, wholly agree with him as to a definite time for mixing a given sample, such as five minutes. It seems to me that the time for mixing should be governed wholly by the conditions involved in each individual case. Is there not danger in many instances of re-concentration by specific gravity by over-mixing? Why would not two or three minutes mixing accomplish all that five minutes will? If five minutes is better than two or three, why not extend the time of mixing to ten minutes or longer? My own experience leads me to believe that as soon as a sample is thoroughly mixed, whether it be in one, two, or more minutes, the operation should cease. Possibly that is a habit acquired in the assay-laboratory, in which conditions are somewhat different than those under discussion.

Referring to the taking of mill-test samples that shall be representative of the average orebody, I find that Mr. Burch, in his discussion, asks the same question that occurs to me, namely, "How can it—the mill-test sample—be made representative?" I will cite a case in point which represented a most difficult problem of valuation either by hand-sampling or by mill-test sampling, the latter by reason of the fact that it seemed impossible from the character of the deposit to take mill-test samples that would be 'representative' of the average ore. The mine in question is in Montana and is a large low-grade deposit, in superficial area approximating 1200 by 1500 ft., in which area the entire mass is more or less mineralized. An assay-plan representing over 700 samples, said to have been taken by a reputable engineer, was submitted and showed an average gold-value of \$2.65 per ton. These samples were taken systematically from over the entire surface-area of the deposit and in 5-ft. cuts throughout the length of an adit 900 ft. long driven into the deposit, giving at the face a depth of about 500 ft. The value stated individually ran from less than \$1 to over \$10 per ton, and while the distribution of the gold was continuous throughout the deposit, it was erratic.

I made a preliminary test by hand-sampling at different points, locating the original point of sampling as closely as possible, both on the surface and underground

and taking comparatively small samples. My results showed an average of 92c. per ton. I then made a second preliminary test by hand-sampling, taking much larger samples, mixing thoroughly and quartering carefully, my results showing an average of 79c. per ton. A third preliminary test by hand-sampling was made with an engineer representing a large mining corporation that was considering the purchase of the property. This test was preliminary to a final complete sampling of the property for valuation. He took a definite 100-ft. section of the adit and sampled every 5-ft. section, while I took a definite section of the surface, sampling also in 5-ft. sections. These samples were mixed thoroughly and quartered, the combined results showing an average of between 80c. and 90c. per ton. None of the individual samples showed any close comparison with the individual comparative samples on the assay-plan. Here then was a case of two engineers against one, that one maintaining he was right. To settle the controversy, a mill-test sampling was suggested, but, the problem was how to get mill-test samples that would be 'representative' of an orebody of this character. We decided it could not be done. It is still unsolved. Possibly this belongs to Mr. Webber's Class 5. I should like to have his solution of that problem. It is quite probable that the dividing of an orebody of this character into "mill-test zones" as suggested in Mr. Webber's closing paragraph, which, so far as I know, is original with Mr. Webber, may be a solution of many vexing problems in mine-valuation. May I not, therefore, suggest again that a more detailed scheme of this suggestion by Mr. Webber would be of decided value and general interest?

E. P. SPALDING.

Spokane, August 15.

## Solubility of Tungsten Minerals

The Editor:

Sir—In your issue of March 31, Mr. W. H. Emmons classes tungsten as a metal that dissolves very slowly when its ores are exposed at or near the surface and subjected to the action of water and air. In the same number you venture to take issue with Mr. Emmons regarding this conclusion, supporting your views by a number of occurrences that are exceedingly difficult to explain if the natural tungstates of iron and manganese, or both, are regarded as stable ores at all comparable say with cassiterite, for Mr. Emmons places both tin and tungsten in the same division of his classification along with gold (in part), bismuth, chromium, and molybdenum.

In the Tavoy district of Lower Burma, quartz veins containing wolfram and cassiterite are common in and about the granites that have been intruded into a group of ancient argillites and clay-schists, locally known as the Mergui series. The climate is a tropical one, the country is mountainous, and for five months of the year subject to an exceedingly heavy rainfall. Denudation is rapid and there are abundant opportunities for observing the results of general atmospheric causes on tungsten

minerals in place. My own results confirm your view that only in a special environment may this metal be classed as one that dissolves slowly.

A large portion of the wolfram produced in Tavoy is obtained by hydraulic methods from detrital deposits, but there are no true wolfram placer deposits or anything resembling them, though the aluvial deposits of the slopes merge into true placers in the valley-bottoms. These often contain cassiterite, sometimes in profitable quantities, but long before the water-sorted gravel is reached the wolfram has ceased to appear, though it comes from the same lodes as the tin ore in which usually it is found in considerably greater proportion. The only wolfram seen in the placers themselves occurs tightly enclosed in unfractured quartz, to which it owes its preservation. Chemical analysis of tin ore obtained by dredging in this district reveals as a rule less than 0.25%  $\text{WO}_3$ , though an examination of the detrital deposits of the hillsides from which the placers are derived would in most cases show more wolfram than tin. The rapidity with which wolfram disappears in this way is remarkable; this is partly explained by the very perfect cleavage of the mineral, resulting in its disintegration on movement and the production of a comminuted form eminently suitable for chemical decomposition.

Again, observations on the weathered outcrops of the lodes themselves prove that wolfram is readily dissolved. Sometimes nothing is left but the empty cavities once occupied by the crystals; occasionally these are filled with sintery oxides of iron and manganese while nests of yellow tungstite bear witness to the original presence of the mineral.

Wolfram-bearing pegmatites are not unknown here and the kaolinization of their feldspars results in the rapid decay of the wolfram by the formation of soluble alkaline tungstates.

Calcareous rocks, to all intents and purposes, are absent in those portions of the district opened up at present and the formation of the insoluble lime tungstate is rare.

The invariable association of sulphides with the wolfram of Tavoy is not without a bearing on this subject. Iron pyrite always accompanies this mineral, chalcopyrite is common, pyrrhotite and mispickel are not rare. Galena, zinc-blende, molybdenite, and bismutite are found in places. The ready oxidation of the iron and copper sulphides produces solutions that attack the tungstate, while the mechanical effect of their removal from the lodes opens the way for deeper-seated chemical action.

You have remarked that tungsten is a common accompaniment of gold and that it is a persistent associate of high-temperature copper ores. Gold is known to occur in small amounts in the alluvial deposits of Tavoy, but its association with tungsten in the lodes of the district has not yet been proved, probably because the matter has never been investigated. Copper ores are found in small quantities in most wolfram-quartz lodes here. Minerals like topaz, tourmaline, and flourspar are quite subordinate to the sulphides as associated minerals. They are

found in small quantities, but appear to have played very little part in the reactions of wolfram genesis.

Thus evidence gathered in the Tavoy district indicates that tungsten must not be classed as a metal that dissolves slowly.

J. COGGIN BROWN,  
Geological Survey of India.

Tavoy, Lower Burma, May 6.

## The Extra-Lateral Right

The Editor:

Sir—I have read Mr. Colby's article, 'The Extra-lateral Right,' in your issue of June 2, with a great deal of interest. As a review of the growth and use of the extra-lateral idea from its earliest inception to the present day this paper is a classic and must represent a large amount of painstaking labor and research. As an argument in favor of the retention of the extra-lateral right in our American system of mining law it also presents many good points, and while in his list of conclusions Mr. Colby does not commit himself definitely to the stand that it ought to be retained, still his evident inclination is favorable toward such a course.

The first five of his conclusions, which tend to support his evident belief, are based upon precedent, which, if I may say so, is one of the strongholds of his profession. As an individual, he would be more than human if he could entirely shake off the influence of many years of legal training in which knowledge of and dependence upon precedent in the form of old laws (all human) and court decisions (all human) have formed so large a part. And it is right and proper that, to the end that all men may know with certainty the laws by which they are governed, those laws should rest upon the firm foundation of past authoritative interpretations, but while this principle properly applies to all existing laws, it ought not to govern our action in the matter of making new ones to fit the ever-changing conditions and needs of the people. Therefore, if it can be shown that the extra-lateral right law does not in the best manner possible meet the present and probable future requirements of the majority of the people, it should be discarded and a substitute found just as any progressive manufacturer would 'scrap' an inefficient machine and would install one that would perform his work to better advantage. With a man who approaches the subject in this mental attitude, the first five conclusions, being based on precedent, would have no weight. With the sixth conclusion I heartily agree, namely, that if the extra-lateral right be abolished the principle of discovery must go with it, but is it not true that changed conditions in this country justify the abolition of both, and is it not possible that similar changes in conditions in the older mining countries of the world were largely responsible for the abolition of both as recorded in Mr. Colby's excellent historical sketch? When the principle of discovery and the right of extra-lateral pursuit were incorporated in the miners' rules of this country no way was known for

determining the existence of underground orebodies except to search for outcrops; and the discovery of such outcrops was comparatively easy. It was a game at which all men, skilled or unskilled, rich or poor, might play with fairly even chances of success, and to that period and to a similar period in older countries I believe the laws now in existence were well adapted. It was proper that a man who had been successful in discovering the outcrop of a vein should have the right to follow it downward beyond the side-lines of his location, because it enabled a comparatively poor man to take advantage of his discovery without spending unnecessary time and money in the acquisition of protecting side-claims, thus putting rich and poor upon the same footing. Even with the benefit of the extra-lateral right, however, he rarely obtained the full fruits of his discovery because of the pernicious habit that orebodies have of raking one way or the other within a vein in total disregard of end-lines.

But today the conditions surrounding the prospector have changed and the chances of finding valuable orebodies by searching the surface for outcrops are few and far between. The mining geologist has come into the field and tells us that under this broad exposure of gossan there may be a valuable deposit of copper ore or it may be a valueless body of pyrite; that under this flow of lava may be found the extension of the vein-system from the other side of the hill, if it has not been pinched out or been displaced by an unknown fault; or that this great vein which apparently terminated against a slip may be found buried under the débris of yonder valley, if some other calamity has not overtaken it; and based on this indefinite information—indefinite because, unlike the law (?), geology is not an exact science, men spend thousands and hundreds of thousands of dollars attempting to make a discovery. They will not do this, and as a matter of fact do not do it without first acquiring some sort of title to sufficient territory to protect their discovery no matter which way the vein, when found, may course or dip. And the poor prospector of today, not in spite of the extra-lateral right law but because of it endeavors to protect his meagre discovery by locating enough surrounding territory to prevent the encroachment of neighbors. It is practically impossible today in any new district in the United States to find the outcrop of a vein sufficiently prominent to enable a prospector or even a trained geologist to determine its exact course and dip for any considerable distance. Therefore both classes of mineral explorers, the capitalists who gamble on geological information and the prospectors who hunt for croppings, violate the law by making numerous protecting locations upon which no mineral discoveries are or can be made. These violations of the law are winked at by everyone except the guardians of the national forests, but why not change the law so as to make legal the actions of nine-tenths of the men who make locations under present conditions instead of trying to make nature fit the law based on precedent? To

do this would undoubtedly mean applying the solution suggested in Mr. Colby's ninth conclusion.

Regarding the volume and expense of litigation that might arise because of such a radical change in our system as compared to the volume and expense of litigation under the present laws, I do not pretend to the wisdom of Solomon, but believe from the known experience of other countries that the change would be for the better in this respect. In the first place, as fully set forth in a letter from V. G. Hills, published in your issue of June 30, I believe that in estimating the relative importance of extra-lateral litigation Mr. Colby has omitted most of the really heavy items of expense, namely, the sums of money expended by mining companies to avoid such litigation. Secondly, the absence of such litigation in the Spanish-American countries and the British dominions, including even British Columbia, where a new law has been super-imposed upon the old one, which gave extra-lateral rights, is in itself good proof of the benefits that might be hoped for from the abolition of the extra-lateral right and the correlative discovery principle. As regards British Columbia, it is true that some litigation has arisen over the adjustment of the new law to the old, but it must be remembered that mines do not last forever and that in time mines located under the present law will become exhausted and with them the chances for new extra-lateral litigation.

I am in perfect agreement with Mr. Colby's eleventh and final conclusion, namely, that if the law is to be changed, it should be changed only after careful study by a competent commission to the end that it may fit as well as may be with all other laws governing the disposal of our public domain.

In conclusion, it is reasonably well known, Mr. Editor, that in the past I have derived a considerable revenue in payment for services connected with extra-lateral litigation and in advocating means to avoid such litigation, I am reminded of the story of the railroad conductor who had been caught collecting fares for his own benefit instead of that of his employer. He was called before the superintendent and asked what he had to say for himself. He invited that official to take a ride with him in his motor-car and as they passed through the country he pointed out to him a well-kept farm with good buildings, cattle, and horses. He said, "I own that place and I own this motor-car; I have all I want and if you discharge me and hire a new man he will have to begin at the bottom and acquire them as I did."

ALBERT BURCH.

San Francisco, August 12.

FERRO-MANGANESE is now selling at \$400 per ton at Eastern points, this being based on the alloy containing 80% manganese. Quotations for the first quarter of 1918 are \$350 per ton. Spiegeleisen is quoted at \$80 at the furnace. The indifference regarding the future is interesting in view of the Government's appeal for rigid economy in recovery of manganese from slag.

# The Labor Troubles at Butte

By AN OCCASIONAL CORRESPONDENT

The labor situation in the Butte district, while it bears a similarity to the condition prevalent for some months past in most mining and industrial districts of the United States, and while it is the result of all the other labor troubles that have existed in this big mining district and have never been definitely remedied, was undoubtedly brought to a crisis by the Granite Mountain fire.

Under a seemingly placid surface the current of trouble has been flowing for many months. In February last the Electrical Workers Local Union took up with the Montana Power Co. the question of higher wages and

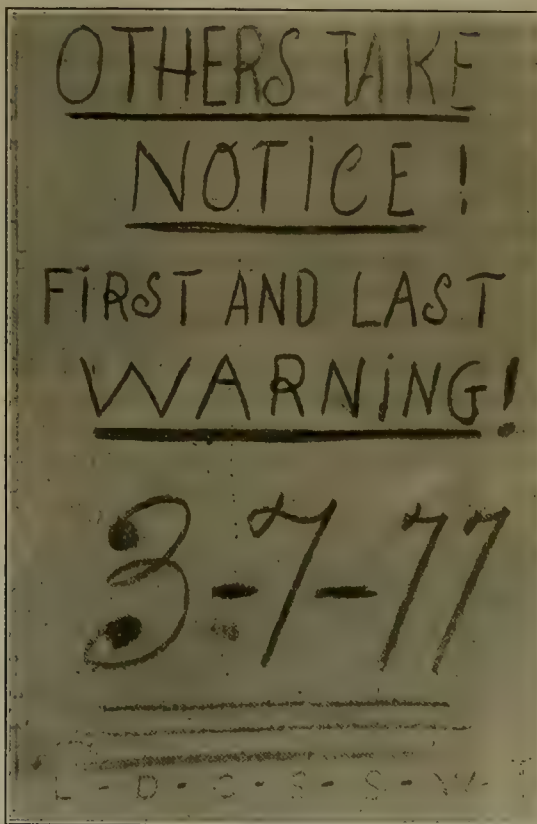

bear upon the Montana Power Co. to grant the demands of its electricians. The electricians' strike committee recognized the Butte Mine Workers Union, voting to support that union in its demands. Soon afterward the

THE FIRE IN THE GRANITE MOUNTAIN SHAFT

better working conditions for its members. Definite answer to these demands was postponed repeatedly, until, on June 5, the Electrical Workers voted to discharge their conference committee and to declare a strike against the Montana Power Co. They demanded \$6 per day, and time and a half for Saturday afternoons and Sunday. Before this difficulty was settled the fire occurred in the Granite Mountain shaft of the North Butte Co., as a result of which more than 160 men lost their lives. Immediately following this the miners began to 'lay off' and the seed was sown for the organization of the Butte Mine Workers Union, which took place on June 11. The leaders were Tom-Campbell, Joe Shannon, Dan Shovlin, and others prominent in labor circles in the West for many years. The organization appealed to the miners, and a large membership was soon secured.

Almost the first question before the new union was that of affiliation with some national organization, but it has become a principle of this union to remain independent. The electricians working for the mining companies went out in sympathy with the electricians that were striking against the Montana Power Co., and they demanded that the mining companies bring pressure to

The paper stuck by the vigilantes on Little. The figures refer to a grave 3 ft. wide, 7 ft. long, and 77 in. deep. The initials refer to labor leaders, the one with the circle meaning the first victim.

Metal Trades Union, blacksmiths, machinists, and boiler-makers employed by the mining companies went on strike in sympathy with the electricians, because non-union men were doing electrical work at the mines. However, the Metal Trades Union was unable to recognize the Butte Mine Workers Union, as that body was not affiliated with the American Federation of Labor, of which the Metal Trades Union is a member.

The engineers' local union was approached by a committee from the Electrical Workers Union to call a sympathetic strike, which would close the mines completely. The hoisting-engineers had endeavored about seven years ago to withdraw from the Western Federation of Miners.

During this trouble it was claimed that electricians had taken the places of some of the engineers, and it seems probable that the refusal of the engineers to vote more than moral support was by way of retaliation.

The B. M. W. U. then took a vote on the question of affiliation with the A. F. of L. The proposal was rejected by a majority of over 10 to 1, the principal reason doubtless being the fact that Charles Moyer, former president of the W. F. of M. is now head of the International Mine, Mill & Smeltermen's branch of the A. F. of L. Following this action the Butte local of the I. M. M. & S. union withdrew their charter and joined the B. M. W. U. in a body. This action pulled out all the mill and smelter workers in Butte.

The B. M. W. U. demanded, among other things, a flat wage of \$6 per day for all underground employees, regardless of the price of copper, abolishment of the 'rustling-card' system of employment, appointment of a committee consisting half of members from the union and half of members appointed by mining companies to make mine examinations continuously, the trial before another such committee of all men discharged, improvement in general underground working conditions, such as providing manholes in all underground concrete fire-bulkheads.

At all meetings of the B. M. & W. U. one of the conspicuous points noticed is the constant warning by its leaders against the use of violence, and this body has conducted its strike in a manner remarkably free from anything of that sort. The union constantly petitioned congressmen from Montana and the Department of Labor to have working conditions and living conditions in the Butte district investigated by Federal authorities. After considerable delay, W. H. Rodgers of the Department of Labor was sent to Butte. His investigation, extending over a considerable period, and based on information from all possible sources, failed to result in any remedy for the situation, Mr. Rodgers being withdrawn suddenly without making any statement or any attempt at relief.

After about three weeks the Montana Power Co. reached a settlement with its electrical workers, granting their demands. At the same time the operating companies announced their new sliding scale of wages based on the price of copper. This gave the miners \$3.50 minimum wage as before, with copper under 15c., \$4 with copper at 15 to 17c., and beyond that a raise of 25c. per day for each 2c. increase in the price of copper. The same sliding scale applied to all other crafts, the base rate with copper under 15c. remaining the same as it was for each class of workmen, with the exception of hoisting-engineers, who were given a base rate increase of 50 cents.

During the entire period of trouble in the Butte district the daily newspapers of Butte and Anaconda have continually misrepresented the facts. They have taken advantage of every event in the usual current of city life to arouse antagonism against the union, its sympathizers, and its aims. When events have been reported truthfully, it has been in a sneering and belittling way, which

has called down upon the press the condemnation of all fair-minded persons, and has brought public condemnation from the Butte Typographical union. The city and county authorities have denied the unions a place to hold large meetings, even to using the city ball-park, in which nearly all Butte unions are shareholders.

All craft-unions that are members of the A. F. of L. voted an acceptance or rejection of the new sliding-wage scale, as it applied to each particular craft. It was agreed that if a majority of the several unions should accept each its individual scale, the entire proposal would be binding on all crafts affected. In this way it was possible for unions with memberships as small as 11 members to cast as important a vote as a union of 800 members. The majority of the unions voted to accept this scale, and all crafts went back to work. The individual members of the unions that voted to reject the scale were, however, in a majority.

A concession in respect to the 'rustling-card' system was granted with this scale, giving the applicant a 'temporary rustling-card' upon application for a job, the same to be replaced by a permanent rustling-card issued after the necessary information concerning the man had been received by the company. Within a week after the majority of all craft-unions had voted to accept this scale, and had all gone back to work, 90% of the electricians on the hill quitted individually, and, without any action as a union, demanded a flat rate of \$6 per day and time and a half for overtime. Probably 75% of them are still out.

On the morning of August 1, Frank H. Little, a member of the I. W. W. executive board, who had been in Butte for a short time, was taken forcibly from his room by six masked and armed men. He was gagged, thrown into an automobile, driven about two miles, and strangled to death by hanging from the Milwaukee railway trestle. While the situation was tense during the following few days, there was absolutely no lawlessness nor attempt at revenge. He was buried on the following Sunday in a Butte cemetery, and escorted to his grave by what was probably the largest procession of men ever seen in Butte. Little's speeches differed radically from the B. M. W. U. leaders' speeches, in that he bitterly denounced the soldiers, attacked the Government for its war policy, and counselled "direct action."

Many of the Montana unions have voted money to help the B. M. W. U. and most prominently the M. M. & S. union of Anaconda. Several weeks ago Campbell, of the B. M. W. U., went to Anaconda to meet the members of the Anaconda union. He and his party were met at the train by the sheriff and deputies and ordered to return to Butte. A few days later he was publicly invited by that union to come to Anaconda and address them, and practically every union man in Anaconda appeared in the escorting party from the train to the Union hall. Last week this union, which had previously voted against accepting the scale proposed by the operating companies, took a strike vote on the question of standing by the agreement of the other unions. The strike vote secured

a small majority of the members, but failed to obtain the necessary two-thirds majority required by their constitution.

Miss Jeanette Rankin, congresswoman from Montana,

per lb., this one purchase will cost the Government \$6,000,000 more than the advertised price. In conclusion, she appealed to the miners to attempt a peaceful settlement of the strike and ever to bear in mind that we are at war.

THE GRANITE MTN. SHAFT ON JUNE 9, 1917, SHOWING THE CROWD OUTSIDE THE FENCE

arrived in Butte on August 14, on a visit to her home at Missoula, and stopped in Butte to offer her services in an attempt to bring about an adjustment of the labor troubles of the district. She addressed the B. M. W. U., their friends, and sympathizers at a mass meeting held at Columbia Gardens, about three miles outside the city, on August 18. To quote from her speech: "I am convinced that the demands of labor in this struggle are just, and should be granted . . . If the rustling-card can be defended in theory, its abuses in Butte are reprehensible and cannot be defended . . . Labor has no right to take advantage of unsettled conditions to enforce unjust demands, and capital has no right to take advantage of labor to compel labor to make all the sacrifice simply because we are at war." In speaking of the Government's purchase of 50,000,000 lb. of copper at 16.67c. per lb., when the market-price was 32c., Congresswoman Rankin drew attention to the fact that the operators refused to accept that price for the second 50,000,000 lb. purchased by the Government, and that the price which the Government must pay is being determined by the Committee on War Purchases. Should the committee set the price at 28c.

A Federal investigator in the person of Justice Covington of the Supreme Court of the District of Columbia has been appointed to look into conditions in the Butte district. His appointment, following so closely on the addresses of Congresswoman Rankin of Montana before the House, is taken as a result of that speech. The B. M. W. U. has petitioned the Government to investigate charges of German activity and German financing of the strikers, and the results of Justice Covington's investigations will be awaited with interest.

The main issue at stake seems to be the rustling-card system, instituted after the trouble in 1914; it is in use at all the mines except the Elm Orlu and the Tuolumne, owned by W. A. Clark and the Tuolumne Mining Co., respectively, and at a few small independent properties. While some

such system properly used is of undoubted value to an employing concern, still the rustling-card system as applied in the Butte district has been badly abused

RESCUE CREW FROM THE TRAMWAY MINE WORKING AT THE GRANITE MTN. SHAFT. THE DOOR BEHIND THEM LEADS TO AIR-TIGHT CHAMBER WHERE THEY STOPPED ON THE CAGE

and employed for political purposes. Since the results desired—efficiency of workmen and employment of a better type—might be obtained in other ways, it is

not clear why this complete concession is not granted. It is certain, however, if every concession asked by the striking workmen be granted, it will be many months before the district can return to the same level as that on which it was working before the Granite Mountain fire, for hundreds of miners have scattered to different parts of the country. If the increase of 50c. per day, which has been forced from the operating companies, had been given on their own initiative, as a share to the workers of the immense profits being made from this unprecedented war-business, it would have gone far in averting the greatest part of the existing trouble.

It is a well-known fact that, in the Butte district, any increase in wages granted to the miners is followed immediately by a much greater proportionate increase in the cost of necessities. If the operators, instead of cultivating the friendship and support of the merchants and politicians, would seek the goodwill of their own men by controlling to some extent these irritating conditions, it is safe to say that their difficulties with labor would be greatly relieved; and, in this direction, announcement by the operating companies of weekly pay-days should be noted. This will do away with the loan-shark and the assignment-broker. A few such steps as this would make Butte the best city in the world for workmen and would attract the best class of miners instead of 'ten-day' men.

As is clearly shown by the loss caused by workman's compensation through the Granite Mountain fire, the operators themselves would be benefited by a more rigid mine inspection than is afforded by the present system, in which the inspection of all mines in the district is made by one man, who is appointed by the Governor as a reward for political activities. This does not disparage the excellent work of the Safety First departments.

A final word: Looking at the wonderful strides that have been made at Butte in mining methods, machinery, and metallurgy, it is hard to conceive how the district can be so negligent in caring for the welfare of its employees. It is this defect in modern corporate management more than the wage question that causes an irritable spirit and a repetition at frequent intervals of these strikes. The present situation is this: All crafts except electricians are at work, 75% of the electricians are still out, but are not on strike, and from 35 to 40% of the normal number of miners is at work in mid-August.

The figures 3-7-77 on the paper attached to the body of the murdered man were used by the early vigilantes; they signify a grave 3 ft. wide, 7 ft. long, and 77 in. deep. The initials at the bottom are supposed to be those of the labor leaders, the first, with the circle around it, meaning Little, and the others Dunne, Campbell, Shannon, and Sullivan. The shaft to the right of the Granite Mountain, in the third photograph, is the Speculator; this was bulkheaded at 800 ft. at the time of the fire and the draft turned down-cast by the fan, all the rescues being effected through it at 2800 ft. deep. The rescue-team is a reminder of the systematic live-saving work organized by the U. S. Bureau of Mines.

## An Industrial Romance

The purchase of the Buffalo Copper & Brass Rolling Mill by the American Brass Co. brings to light an industrial romance which has few parallels even in this land of opportunity. Prior to the War the energies of this concern were chiefly employed in trying to keep down the size of the annual deficit. It was manufacturing a small quantity of roll and sheet copper. Then came the War, which catapulted the company into the front rank of munitions producers, with \$60,000,000 of gross business a year and millions of net profits, making it also, next to the American Brass Co., the world's largest consumer of copper and a tremendous user of spelter. William A. Morgan, who left Swift & Co. to take hold of the Buffalo company, secured in Canada and the United States contracts for making brass discs to be used in the manufacture of shrapnel shells. At this juncture a practical brass man, in the person of Russell A. Cowles, brought new blood and new capital into the management. He represents the third generation of a brass-making family. He severed a 22-year connection with the American Brass Co. and its predecessors, invested heavily in the Buffalo company's securities, and later, when a programme of expansion had been decided upon, interested his friend, John N. Willys, sufficiently to invest over \$1,000,000 in the Buffalo enterprise. The demand for brass rods for the French and British governments becoming so large and insistent, the company then erected the largest rod mill in the country, all in a period of 90 days. Orders secured from J. P. Morgan & Co. and others showed paper profits more than sufficient to pay for this new mill before a wheel was turned. The rolling-mill capacity was then doubled and Buffalo Copper & Brass became the largest producer of brass discs and cartridge metal, as well as the largest single mill producing brass rods, in the United States. Some idea of the size of this plant may be derived from the fact that the amount of metal cast reached the enormous total of 40,000,000 lb. per month. Furthermore, Mr. Cowles's purchases of copper and spelter during 1916 were probably the largest of any single individual in this country, with the exception of purchases made for the Entente allies. All of this resulted in gross business of \$60,000,000 in 1916, for the Buffalo company. From the profits of 1915 and 1916 the company early in 1917 paid a dividend of \$1000 per share on the common stock, owned chiefly by Messrs. Morgan, Cowles, and Willys. Following this big disbursement the plant was sold to the American Brass Co. for several million dollars. Mr. Morgan has now become general manager for the Curtiss Aeroplane Co., while Mr. Cowles has assumed the presidency of one of the oldest New England manufacturing concerns, the Ansonia Clock Co., which his father, A. A. Cowles, headed at the time of his death.—*Boston News Bureau.*

SCIENCE is organized common sense.

THE KALATA PLANT OF THE VERK ISETZ CORPORATION, RUSSIA.

## Mining and Smelting Copper Ore at Kalata

By F. W. DRAPER

**INTRODUCTION.** The Kalata mines, belonging to the Verk Isetz Corporation, are situated on the extensive series of copper-bearing schists that lie mainly on the eastern slope of the Ural mountains, running north and south parallel with the axis of the range. The Kyshtim properties, described by E. J. Carlyle in the *Engineering & Mining Journal* of June 22, 1912, mark the southern end of this copper belt. Kalata is about 145 miles north of Kyshtim and between these two points copper has long been produced on the Sissert estates, and since the purchase of these by English capital the energetic campaign of exploration conducted under the direction of their chief engineer, Norman C. Stines, has resulted in the blocking-out by diamond-drilling of large lenses in an entirely new locality. At other points it is also certain that workable deposits exist. About 75 miles north of Kalata, in the southern part of the Bogoslovsk estates, diamond-drilling during the last few months has proved the existence of a large deposit.

The ores along this belt are all heavy sulphides, but their character varies in the different localities. At Kyshtim the copper is quite evenly distributed, the richest part being in the centre of the lenses, gradually diminished toward the sides, while at Kalata the copper is very unevenly distributed. There are low-grade areas also, but they have so far proved too irregular both in horizontal and in vertical extent to make it feasible to break them separately for sale to the sulphuric-acid manufacturers. The Kyshtim ores contain considerable barite

and zinc-blende, which are entirely lacking at Kalata, and the gold and silver contents are also considerably higher at Kyshtim than at Kalata. A distinguishing feature of the Kalata orebodies is bands of magnetite in the pyrite, these bands in places being several inches wide. They are particularly noticeable at the southern end.

Both the schist and the ore are much more silicious at Kyshtim than at Kalata. Carlyle quotes the silica content of the Kyshtim ores as 12%, whereas at Kalata it is only about 2%. The fine is slightly more silicious than the coarse, due to admixture of schist from the partings in the lenses. The average analysis of the coarse ore sent to the smelter during the first eight months of 1915 was Cu 2.3%,  $\text{SiO}_2$  1.93%, Fe 43.5%, and S 50.0%. We frequently have over 51% S for considerable periods.

The mines were opened very early in the last century and were worked mainly for the pyrite used in the manufacture of acid. Copper was smelted in the neighborhood, but there was no rich gossan on the Kalata lenses and all the available data indicate that to a considerable depth the pyrite was lean, so that probably none of it found its way to the smelting-plant. The name Kalata, derived from the Russian verb 'to strike', is probably suggestive of working conditions in the mines in the early days.

In 1912 the Verk Isetz management, deciding that the grade of the ore then worked was sufficiently high in copper to make its smelting profitable, decided to install a modern smelting-plant, and I was engaged to design

and supervise the construction. At that time the mine was practically worked-out down to a depth of 357 ft., but diamond-drilling had proved the continuity of the lenses below this level, and subsequent drilling disclosed large ore-reserves. The principal lens at the present working-levels, at 406, 455, and 560 ft., has an extreme length of 560 ft. and a maximum width of 84 ft., yielding about 3000 tons of ore per foot of vertical depth. There are a few stringers of schist, but otherwise the lens is solid pyrite.

The pitch of the lenses down to 455 ft. was eastward at 70° from the horizontal, but below that level down to the 665-ft. level they stand almost vertical. Besides the principal lens, there are smaller parallel lenses in the hanging wall.

**MINING.** Prior to 1913, the ore was extracted with close timbering, but since then square sets have been used, except in the small blocks that had been left in the upper levels. The last 7-ft. slice between levels will also be taken out with close timbering. The ore when exposed to the air quickly develops cracks, making a dangerous roof, and timbering must be kept close to the faces. In general, freshly exposed ore must not stand over two weeks without timber-support. Heavy pressure develops so rapidly that filling must not be allowed to fall behind. It is never safe to have over one 7-ft. slice unfilled. For filling we use blast-furnace slag broken from the smelter-dumps, which is cheaper here than breaking rock and hauling it to the shafts. A considerable saving will be made as soon as we complete arrangements to supply granulated slag.

At present there are three shafts. The Marinsky shaft was formerly the main working-shaft, but the upper 140 ft. is in the lode, and the ground around it is now badly caved and the surface is constantly sinking. In July 1912 a fire broke out in the old close-timbered stopes above the 364-ft. level; in consequence the mine had to be closed and flooded, it being impossible to wall-off the burning area. The management then decided to sink a new working-shaft in the hanging wall, and work was started under contract in August, the work being done by the Belgian firm of Prüdan-Nöel, which sank 420 ft. in 139 days. Compared with work in other countries, this was not rapid, but for this part of Russia, where 35 ft. per month was considered good, it constituted a record. The work was done by Russian and Tartar workmen under Belgian foremen. At the extreme northern end of the lenses, the Savinsky shaft connects with the 560-ft. level. This is the main auxiliary shaft, and most of the men and timber enter through it.

All hoisting of ore is through the Kalata shaft, which is now down to a depth of 770 ft. From this shaft the 675-ft. level is just being opened up. The hoisting equipment consists of a direct-connected double-drum hoist, using three-phase alternating current at 2100 volts. The hoist was manufactured by Brown, Boveri & Co. of Baden, Switzerland, and has given satisfactory service. The motor is of the double-commutator type, with Deri connection. The control-standard has a single-hand lever,

which controls both the regulation of the motor and the adjustment and operation of the brake. This lever swings in two planes, the longitudinal displacement controlling the motor and the lateral movement adjusting the brake. At the time of writing, the hoist has been in service three and a half years, and the only serious repair required was the re-winding of a burned-out coil on the stator. When purchasing the hoist there was some question as to how long the commutator-rings would last, but no difficulty whatever has been caused by them.

The skips are self-dumping, of the Kimberley type, each capable of hoisting 3½ tons at a speed of three metres per second. The ore falls from the skips on an inclined grizzly with bars spaced 1½ inches, the oversize going to the coarse-ore bins, and the undersize to a revolving trommel with ¾-inch round holes. The oversize from the trommel falls into the coarse-ore bins and the undersize into a separate bin. Only the coarse ore and oversize from the trommel are sent to the furnaces. We can take material smaller than ¾-in. to the furnaces, but the fine wet pyrite blinds the screen if we use smaller holes.

The mines are fairly dry, the water to be pumped amounting to about 250 gallons per minute, but it is strongly acid and contains normally about 0.2 grammes of copper per litre. About 80% of this is recovered by precipitating on scrap-iron. This extraction can be improved, but up to the present it has not been feasible to re-construct the precipitating-plant.

Owing to the acid character of the water, the pumps have to be of special composition. The first equipment in the new shaft on the 455-ft. level consisted of two centrifugals and one three-throw plunger-pump, each capable of handling the entire quantity of mine-water. The plunger-pump was purchased owing to uncertainty as to whether the centrifugals would stand the combination of grit with acid water. Three years' experience has shown that the centrifugal pumps are more economical, as regards both power-consumption and repairs, than the plunger-pumps, and further installations on the lower levels will be entirely centrifugal. The bronze of which the pumps are made is 80% copper, 19% tin, and 1% lead, and it must be free from even traces of zinc.

In starting a new level, a cross-cut is driven from the shaft to the foot-wall, the main haulage-drift is then run on the hanging wall to the north and south with intermediate cross-cuts at intervals of 50 ft. These cross-cuts are connected along the foot-wall, and then raises are made to the level above at the ends of each intermediate cross-cut. These raises usually have two compartments, one for filling and one for a ladder-way or for lowering timbers. Next stoping is started on the slice above the level. The ore is taken out in horizontal 7-ft. slices, and the filling dumped into place from small cars or from wheelbarrows. Owing to the character of the ore, the roof will not stand, and a heavy pressure develops quickly. This often requires the support of the roof either on rock or timber cribs, and somewhat increases the cost of filling.

Drilling is done mainly with Ingersoll-Rand jack-hammers, the only exception being in the raises, where B. C.

21 stopers are used. Practically all stoping is done on contract, based on the footage broken. In 1915 the average wages of a man in the stopes for an 8-hour shift was 1.65 rubles, and the general average of all men above and below ground was 1.34 rubles (a ruble being equal to 50 cents).

The following figures, which are averages for the year 1915, give an idea of the work done:

Consumption of dynamite per cubic foot of ore broken, including that from development, 90-93% nitro-glycerine .....	0.0245 lb.
Ore produced per drill-shift of 8 hours in stopes.....	125.5 cu. ft.
Ore produced per stope per day.....	27.92 " "
Ore produced per man per day in stopes.....	21.41 " "
Ore produced per man above and below ground per day.....	8.232 " "
Ore produced per foot of hole drilled in stopes..	5.737 " "

These results are below normal because in March we began to use prisoners, who came to us absolutely without experience in underground work, and at the beginning of summer we took Chinese, who, although the contractor agreed to furnish miners, turned out to be wood-choppers and agricultural laborers that had never seen a mine and that did not act as though they ever wanted to. They were from northern Manchuria, which seems to furnish a less desirable type of coolie than other parts of China. This caused considerable decrease of output per man and per stope per day. In January and February, with Russian workmen, the output per stope per day was 42.76 cu. ft.; per man in stopes per day it was 26.57 cu. ft.; and per man above and below ground, 9.536 cu. ft. During the year, the proportion of experienced Russian workmen decreased steadily, the deficit being made up by more prisoners and Chinese, all without previous experience. Under these conditions the output per stope per day had decreased in December to 19.24 cu. ft. per man; in stopes to 16.46 cu. ft.; and per man above and below ground to 7.889 cu. ft. That is, the efficiency of the Chinese and prisoners working with Russian instructors in the stopes after they had had from six to nine months experience was about 70% that of the Russian workmen.

The cost of mining ore for the year 1915 was 3.5988 rubles per long ton, which includes all development, both in the lode itself as well as the shaft-sinking and station-cutting with cross-cuts to the lode. The cost of development amounted to 23.5% of the total. Owing to the War, the cost for the year was about 20% above normal.

**THE SMELTER.** The site chosen for the plant was close to the main hoisting-shaft, the ore being taken direct from the head-frame bins to the feed-floor by the charge-trains.

Quartz of excellent quality was known to exist at various points within easy reach of the smelter-site, but not in large quantities at any one point. Limestone, also of excellent quality, was to be had in unlimited quantity about 1½ miles away. This scattered distribution of fluxes within a radius of 7 to 8 miles of the smelter led us to utilize horse-transport. The choice was also influenced by the decision of the management not to connect the smelter with the Government railway 5½ miles distant,

pending the conclusion of negotiations with the latter for the construction of the necessary branch. This was undoubtedly a mistake even in a country where wages are low. Labor at low wages is not always cheap labor. For light supplies horse-transport in the Urals has been cheap, but for heavy pieces very expensive. It would have been cheaper to construct the branch at our expense. Negotiations, especially with the government-owned railways of Russia, do not move rapidly.

As transportation by horses is much cheaper in winter than in summer, and in summer the supply of available horses is much less, provision had to be made for the storage of fluxes for 6 to 8 months. In order to be able to negotiate with the teamsters at the beginning of winter, it was necessary to have a couple of months reserve still in stock at that time, so that they might see that their immediate services were not indispensable.

After considering various plans, it was decided to install a Bleichert cable-crane having a span of 700 ft., with one movable and one fixed tower, and suitable bins for storing a 24-hour supply of ore and fluxes. Our first idea was to equip it with a grab-bucket, but, after careful investigation, we came to the conclusion that such a bucket would not pick up either coarse ore or limestone. The crane was accordingly equipped with ordinary detachable boats.

The working of the crane, from a mechanical point of view, has been quite satisfactory, but the cost has been higher than we anticipated, partly owing to war conditions and partly to fluctuating demands on the crane. During holiday periods, which are frequent in Russia, the miners will not work, and consequently it was necessary to increase greatly the tonnage handled by the crane. For single days the available storage in the mine sufficed to supply the tonnage needed, but the Russian dearly loves to take several days preparing for a holiday and several days getting over it. However, since the prohibition of the sale of vodka, things have greatly improved. The handling of this extra tonnage necessitated adding men to the regular crew and these men could be obtained only at excess wages, which made it necessary to pay extra wages to the whole crew.

The movable tower has also proved to be of no advantage. The boats can be hoisted only from points directly under the cable, or at most not over seven feet on one side, and with piles of various materials, each of which is being removed at the same time, it is not feasible to keep the edges in a straight line. We have found it cheaper to lay transverse service-tracks, on which the boats are moved by means of transfer cars, than to move one tower at short intervals. These service-tracks also greatly extend the storage-area that can be served by the crane. The cost of transferring material from the stock-piles to the bins was, under pre-war conditions, about 12½ cents per long ton.

The charge-trains, which run either to the shaft-bins or to the cable-crane bins, consist of side-dump cars, each holding two tons of ore, and are drawn by 6-ton single-phase electric locomotives. The charge is dumped di-

rectly into the furnaces through doors on the sides, alternating so that ore is charged first on one side, then on the other, the fluxes being charged on the side opposite to the ore. Fuel is charged by shovel through the end doors. The average charge weighs about 20 tons, of which 65-70% is ore. A normal charge consists of 25,200 lb. of pyrite, 7200 lb. quartz, 3060 lb. limestone, and 3600 lb. of secondaries. The quartz carries 91-93%  $\text{SiO}_2$ , and the limestone 50-51%  $\text{CaO}$ .

**BLAST-FURNACES.** There are two water-jackets, each measuring 287 by 56 inches at the tuyeres and 287 by 71 in. at the throat, with an effective height from the tuyeres to the charge-plates of 14 ft. They have two tiers of jackets, the water from the lower set going directly into the upper through flexible-hose connections. This decreases the piping, the quantity of water to be handled by the circulating-pumps, and ensures clean water into the upper jackets, thus removing a fruitful source of burning-out of these jackets on the lower corners and edges. In two years we burned out one upper jacket. Long single jackets are, I think, better than the arrangement I have mentioned, but at the time we planned our furnaces there was difficulty in getting the long jackets made in Russia.

The spout connecting the furnace with the fore-hearth is shown in the accompanying sketch. They are cast from converter-copper in cast-iron forms, and have given us most satisfactory service. The connection of the individual cooling-pipes through stuffing-boxes to the main cast-iron supply and delivery pipes permits the quick cutting out of any one or more burned pipes, these being simply cut off with a hack-saw, and blanks bolted over the stuffing-boxes on each side. We have run spouts for some time with three consecutive pipes burned through, and for some days with six, by keeping a spray of water on the outside. A separate detachable tip, cast from converter-copper, is used, and to facilitate changing this without cutting off the water from the main spout, this tip is provided with separate cooling connections. At first we had much trouble with the burning-out of these tips with our low-grade matte, but we now protect them with a piece of talc cut to shape and laid in a mortar of magnesite mixed with water-glass. These talc blocks usually last 24 hours and the changing of them is a matter of only five minutes. Magnesite brick can be used in place of the talc, but it does not last any longer.

The furnaces can be drained through a small tap-jacket on the side toward the converter-aisle. Thus the contents of the furnace can be poured back into the settler by the crane. In case of spout trouble, the furnace can be operated through this side opening, the slag and matte being poured into the fore-hearth by the crane.

**SMELTING PRACTICE.** When smelting a green-ore charge, our concentration is 5.25-5.5:1, the resulting matte being 12.5 to 13.5% copper. This matte we convert direct in basic-lined 12-ft. converters of the Great Falls type. Under our conditions, the cost of oxidizing a pound of iron is less in the converters than in the blast-furnace, and when we take into consideration the extra

cost of re-handling low-grade matte to get it to the furnace, and that it crowds ore off the furnace, with one furnace operation this economy is greater than the extra slag-loss involved in the larger tonnage of converter-slag poured through the settlers.

The average grade of matte which we treated during the first eight months of the year 1915, together with the cost of oxidizing a pound of iron in the blast-furnace and in the converter, is shown in the following table:

Month	Grade of matte % copper	Cost of oxidizing 1 pound (36 lb.) of iron	
		Kopecks (1 kopeck = $\frac{1}{100}$ cent)	
		(A) In blast-furnace	(B) In converter
January .....	12.7	10.8	8.23
February .....	19.5	11.34	11.51
March .....	19.3	10.29	10.38
April .....	16.8	9.97	7.80
May .....	13.7	12.57	11.39
June .....	11.8	12.71	8.89
July .....	15.1	19.29	11.82
August .....	16.3	14.88	7.02

The cost of converting in February and March was abnormally high because we did not have enough matte to keep one converter busy all the time, and labor and fixed charges were correspondingly high. In July the whole plant was stopped for a week for some general repairs, and the cost of these repairs and alterations was charged direct to operations, giving high costs for the month.

The average chemical composition of the slag sent to the dump during the first eight months of 1915 was as follows:  $\text{SiO}_2$ , 31.04; Fe, 44.14;  $\text{CaO}$ , 6.31; Cu, 0.33%. The samples are taken every hour and assayed once in 24 hours, a portion proportioned to the tonnage removed to the dump being kept in the laboratory for making up the monthly general sample. Converter-slag is poured through the settlers and is therefore included in the sample of the ore going to the dump. Making correction for this, it gives as the composition of the blast-furnace slag itself approximately the following:  $\text{SiO}_2$ , 33.0; Fe, 41.5;  $\text{CaO}$ , 6.7%.

Blast is furnished by a single-stage turbo-blower capable of delivering 35,000 cu. ft. of free air at 60-oz. pressure; this is coupled direct to a three-phase alternating-current motor of 800 hp., taking current at 2100 volts. For measuring the quantity of air delivered to the furnace, a collar is fitted into the supply-main between the filter and the blower, to diminish the area at this point. This causes a difference in pressure in front of and behind the collar, which can be measured directly and from which the volume and weight of air passing can be computed. We have arranged this so that the weight and volume at various temperatures can be read directly on a scale. These readings are taken half-hourly, and from them the amount of air blown in the 24 hours is computed. The consumption of air per long ton smelted varies from 1550 to 2000 kilo., the average for the year 1915 being 1787. This corresponds to about 50,000 cu. ft. of free air at our pressure and temperatures. The aver-

age tonnage per day was 530 tons (long), and the fuel consumption 1.66% of the charge, or 2.49% based on the ore. Several times we have been without coke and have tried replacing this with coal, successfully. The furnace runs slower and has a tendency to chill in the focus. This could be avoided if we used coke at intervals to re-establish the necessary temperature in the focus. At the time of writing we have just completed a run of five days under such conditions. The coal available was mainly a coking coal, containing 18% ash with which was mixed a little high-grade coking coal. The slag is a little colder than with coke. The following table gives the results of this run:

Date	Ore smelted, long tons	Coal to charge, %	Copper in matte, %	Silica in slag, %
March 27.....	466	2.49	13.0	30.1
" 28.....	468	2.41	12.7	28.3
" 29.....	503	2.28	17.5	31.1
" 30.....	505	2.27	15.5	30.8
" 31.....	513	2.11	19.0	29.1

SPOUT CONNECTING FURNACE WITH FORE-HEARTH

The furnace was running normally and was stopped for reasons other than the fuel, although such experience as we have had leads us to think that after a few more days it would have been necessary to heat it by running a day on coke. Our normal average now on coke is about 600 tons, so that the coal causes the furnace to slow up to 80% of its normal rate of running.

Owing to the physical character of our ore, we make but little flue-dust. In 1915, while smelting 169,760 tons of charge, we produced 1050 tons of flue-dust, or 0.6%. The downtakes from each furnace are nine feet in diameter, leading to a dust-chamber with a cross-section of 350 sq. ft., and 150 ft. in length beyond the first down-

top. This stack also serves the boiler-plant. With two furnaces in blast, this allows for a speed in the dust-chamber of 250 ft. per minute, and the dust settles quite completely. The gases entering the dust-chamber carry 12.3 grammes of dust per cubic metre assaying 2.6% copper, and the gases entering the stack carry 1.666 gr. per cu. m. assaying 1.2% copper. There is much finely divided sulphur in the gases leaving the dust-chamber.

CONVERTERS. There are two stands of upright converters, 12 ft. diam. inside the shell, lined with magnesite brick. As we handle low-grade matte, we blow from 15 to 20 five-ton ladles of matte before blowing to blister. The corrosion of the lining is mainly at the tuyeres, and repairs are required every 30 to 40 days. The remainder of the lining lasts over a year. With more skilled workmen, the lining can be made to last longer and the campaigns should be not less than two months. In July 1914 all our skimmers were called to the army, and I had to try to continue operations with entirely green men. Two

Month	Slag analysis		Iron	Average pressure, lb. per sq. in.	Blowing time, %	Air per ton blister, kilo.	Copper in matte, %

take. From the dust-chamber the gases escape through a stack 212 ft. high and 10 ft. 2 in. inside diameter at the

Blast is furnished by a multiple-stage turbo-compressor designed to furnish 5500 cu. ft. of free air per minute

at one atmosphere. The compressor is direct-connected to a 540-hp. variable-speed motor taking alternating current at 2100 volts. With the speed variation we can run with any pressure down to seven pounds. At the start we had some difficulty with the compressor pumping, but this was remedied by a valve in the intake. This compressor has proved so satisfactory that we have just installed a second one of similar type.

**REFINING.** The gold and silver contents are too low to cover the charges imposed by existing copper refineries in Russia, therefore, pending completion of our own plant, the copper has been marketed direct. The refining-furnace is placed in one corner of the converter-aisle in line with the converters, and molten copper is poured directly into it from the ladle. This avoids the expense of casting and makes a saving of time and fuel in the refining. The furnace is a simple wood-fired one of the usual design. As it has to stand for considerable periods between charges, the fuel consumption is greater than it would be if the furnace could be crowded to capacity. Under present conditions the consumption of pine wood is 0.9 cord per ton of refined copper.

**POWER-PLANT.** The general design of the plant included electrically driven units at all points so that accurate determinations of power consumption could easily be made. For all units consuming considerable quantities of power, separate integrating watt meters are provided, and for the other units the power consumption is approximated by the use of a portable meter, the reading in each case extending over several days.

The boiler-house contains three Babcock & Wilcox boilers, each with a heating surface of 374 sq. m. and equipped with super-heaters delivering steam at the turbines at 330°C. Normally two boilers are in service, the third being in reserve. There is provision for placing another boiler similar in size to those already installed. When the plant was built, economizers were not added, but space was left and they are now being erected.

As planned, the average power requirements at mines and smelter was 1100 kilowatts, and to supply this two Brown-Boveri turbo-generators, each of 1500 kw., were installed. These furnish alternating current at 2100 volts and 50 cycles. Thus one unit is always in reserve. Surface-condensers are used, and the circulating and air pumps are electrically driven, the motor being direct-connected to the one shaft that operates all the pumps.

The power-station is housed in a brick building served by a five-ton hand-operated traveling crane; this building, besides the turbo-generators, contains a Jaeger single-stage turbo-blower for the water-jackets, capable of delivering 35,000 cu. ft. air per min. against a pressure of 60 oz. This blower is direct-connected through a flexible coupling with an 800-hp. motor running at 2950 r.p.m. This unit has now been in continuous operation for three years with no lost time for repairs. It is rather noisy and makes it hard to converse in the room. A second blower of similar type and 38,500 cu. ft. capacity is now being installed. No difficulty with

pumping has arisen, even when running with considerably less than half the rated quantity of air going through. Such a blower should be equipped with a variable-speed motor, as otherwise power may be wasted if the pressure required happens to be less than that for which the machine is designed at full speed.

Two multiple-stage Brown-Boveri turbo-blowers serve the converters, each blower delivering 5500 cu. ft. of free air at 15 lb. These are also direct-connected through a flexible coupling with a 450-hp. alternating-current motor operating at 2000 volts. Each blower furnishes air for one 12-ft. Great Falls converter.

The switch-board is placed on a raised platform at the end of the building nearest the generators, and the instruments controlling the main circuits are on a low stand, so situated that the attendant is at all times facing the engine-room with the main panels of the switch-board directly behind him.

In the basement are the circulating-pumps and the fire-pump. This latter is a steam-unit that can deliver into the main water-circuit of the plant in case of accident to the electric equipment. The water-supply for the plant is obtained from ponds left from placer operations about 1½ miles from the power-plant. From this point the water is pumped by motor-driven centrifugal pumps. These pumps are placed in a sunken station so that they are below the water-level in the ponds. There is thus never any difficulty from failing suction, and the pumps are started and stopped from the power-plant, only a watchman being required at the pumps. A man goes once a day to oil and inspect them. The cost of such a station was somewhat higher, but the saving in cost of attendance has more than compensated for this. To decrease the size of the pumping-station and the diameter of the pipe-line, cooling-towers with catch-basins were built at the plant. One of these serves for the jacket-water and the other two for condenser-water.

THE PHOSPHATE LANDS of Idaho lie in the south-eastern part of the State, in Bear Lake, Bannock, Bingham, Bonneville, and Fremont counties. The Government has reserved 966,377 acres in Idaho as workable phosphate land, to which must be added 4080 acres of officially classified phosphate land in the Fort Hall Indian reservation. Idaho appears to contain the largest body of high-grade phosphate rock in the West. In the Georgetown Canyon region are three commercially workable beds, from 3 to 6 ft. thick, that carry 72.9 to 82.3% of tri-calcium phosphate. The main bed averages 5 to 6 ft. thick and contains about 70% of tri-calcium phosphate. Estimates based on detailed studies indicate that the areas examined by the U. S. Geological Survey probably contain 5,200,000,000 long tons of tri-calcium phosphate. These estimates include chiefly the main bed, which contains high-grade rock carrying 65% or more. Large areas of phosphate land have not yet been examined. Rock-phosphate has been quarried and shipped from Montpelier, Bear Lake county.

# Metallurgy of Lead in Lower Mississippi Valley

By HERMAN GARLICH

\*The development of the extensive South-East Missouri lead deposits greatly preceded that of the Iowa and Wisconsin deposits. It began about 1720 at Mine La Motte and other localities, and has continued uninterruptedly to the present time. It is estimated that this district produced about 184,000 tons of lead in the year 1916, having a value of approximately \$25,000,000. This is a new high record. The South-West Missouri orebodies were hardly known before 1845, and were not extensively developed until 1870. Lead production in South-West Missouri for 1916 was 38,788 tons. Oklahoma produced 14,399 tons and Kansas 2345 tons, making a total for South-West Missouri and the adjoining districts 55,532 tons of lead.

The first metallurgists in Missouri were the Indian and the hunter. The early settler learned to procure his bullets either by melting ore in his camp fire or by throwing pieces of galena on an old stump and depending on the usual 'roasting and reaction' method to obtain the metal. A little more refined method was to arrange two flat stones in the form of a V. Wood and galena were placed in the furnace and ignited. As heat developed, some of the metal was extracted and molded into bullets. The next step in utilizing the lead ore was the log-hearth. All lead in Missouri was smelted in this crude affair before 1820. It was built on sloping ground, and consisted of a hearth of stone, surrounded on the front and two sides by a stone wall. The wall was 7 ft. high in front. The top and rear end were left open and in front an arch or opening was made, forming the eye of the furnace. In front of this a pit was dug in the ground, to receive the molten metal. Large logs were rolled in at the back and made to rest upon ledges formed inside, to raise them from the hearth and to give a draft. These logs filled the entire width of the furnace. Small split logs were then set up around the two sides and the front, and the ore was piled on until the furnace was full. Finally, the mass was covered with logs and fuel until the ore was completely surrounded. A gentle heat was started, which was raised gradually. After 12 hr. the heat was increased and continued for 12 hr. more, 24 hr. being required for each smelting. The furnace treated about 5000 lb. per 24 hr. and the ore yielded about 50% of its metallic lead. A considerable quantity of the ore was not de-sulphurized, and fell between the logs into the ashes, forming a kind of slag, which was called 'lead ashes.'

The ashes were rich in lead and were frequently treated in a furnace of a peculiar construction, called an 'ash furnace.' This was introduced from Virginia and was a

crude reverberatory, built of limestone, which lasted 15 to 20 days on continuous work. As the ash or residue was partly oxidized, the charge was immediately reduced at a moderately high temperature. Silica, as chert or sand, was mixed with the charge. In about two hours the furnace was ready to tap. The slag was tapped first, then the lead on the opposite side of the furnace. The total extraction from the two operations was about 75% of the lead in the ore. The next step in the progress of metallurgical operations in Missouri was the reverberatory furnace patterned after those of Carinthia, Silesia, and England. This type of furnace is no longer in operation, although the Desloge Consolidated Lead Co. operated the Flintshire furnace on a small scale until recently. The reverberatory required pure ores and it gave fair results, considering that no attempt was made to recover the fume.

The Backwoods hearth was another type utilized for the reduction of Missouri ores. The early ones were built entirely of stone and the blast was supplied by bellows. An improvement was the water-backed hearth, which permitted continuous work. The Jumbo hearth of Joplin was an enlarged furnace of the same character. Before the recovery of the lead fume, these furnaces extracted from pure ores about 70% of the contained lead, not considering the lead in the gray slag and fume. It was not until E. O. Bartlett, in the 'seventies, installed the bag-house for recovering the fume that the hearth could be considered economic. On account of the purity of the South-West galena, the Lone Elm Smelting Co. (now the Eagle-Picher Lead Co.) volatilized all the lead possible in short shaft-furnaces (slag-eyes), producing a pigment which they called sublimed white lead, being a so-called basic lead-sulphate consisting of  $PbSO_4$ , with varying amounts of  $PbO$  and  $ZnO$ , the zinc being derived from the Joplin ores, which carry from 2 to 3% of that metal in the high-grade concentrates.

The cupola process was the next one in line, and differed from the methods just described in that it divided the operations into two distinct steps, each performed in separate furnaces. The concentrate was roasted in the usual reverberatory, 55 to 60 ft. long, at gradually increasing temperatures. By later additions of sand, the roasting concentrate was sintered and partly slagged. The usual amount of sulphur left in the sinter was 5 to 6%. To reduce the sulphur lower meant increased temperature to decompose the lead sulphate, with resulting heavy losses in volatilized lead. The round (Pilz) blast-furnace for reducing the sintered product was later replaced by the rectangular (Raschette) furnace. This allowed a large production of lead, but the total extrac-

tion was not over 90%, due to losses in sintering, smelting, and re-treatment of matte.

I have passed lightly over these old practices, which are now almost wholly abandoned.

Analyses of the ores mined in South-East Missouri, that are about the average of the district, and also analyses of grades of resulting concentrate, show that the metallurgy is simple, the removal of the sulphur, and the slagging of the dolomite in the blast-furnace being of prime importance. There is a little nickel and cobalt in these ores, especially in those at Mine La Motte and the North American mine near Fredericktown. The nickel and cobalt concentrates with the copper in the matte, but are eventually lost in refining the copper. James W. Neill made a number of successful blast-furnace runs in the 'eighties at Mine La Motte with nickel and cobalt containing copper and lead, producing a bullion, a matte low in nickel and cobalt, and a speiss containing 23 to 24% of nickel and cobalt. He obtained the necessary arsenic from Western argentiferous speisses, recovering the silver and gold therein. Later the North American Lead Co. built a plant to separate nickel, cobalt, and copper by the Hybinette process. This produced matte containing the three metals, which were then separated by a wet method. The plant has been closed for many years, but is now controlled by the Missouri Cobalt Co. and is being remodelled for another campaign. The big improvements which have revolutionized the metallurgy of the Mississippi Valley ore in the last 10 or 12 years are:

1. The introduction of Huntington-Heberlein pot-roasting, preceded by a preliminary roast in a mechanical furnace (Godfrey), subsequent smelting in the blast-furnace, and filtering all fume through cotton or woolen bags.

2. The introduction of the Dwight-Lloyd sintering process which eliminated preliminary roasting for the concentrate, but not for the matte, with subsequent smelting in a blast-furnace with bag-house attachment.

The Godfrey pre-roasting furnaces were later abandoned in the H. & H. process, and the Wedge roaster was adopted at Herculaneum for the pre-roasting of matte. It soon became apparent that elimination of sulphur was still unsatisfactory, and that there was an undesirable, but necessary, dilution of the concentrate from 70 and 65% to 40 and 45% in lead to render the D. & L. machine applicable with a single roast. To avoid these objections, the double roast is being installed by both the Herculaneum plant of the St. Joseph Lead Co. in Missouri, and the Federal plant of the Federal Lead Co. in Illinois. A rapid preliminary roast is given on a separate line of

D. & L. machines, and this pre-roasted material is then turned over to another set of D. & L. machines (Herculaneum), or to H. & H. pots (Federal) to reduce the sulphur of the finished product to about 2 to 2½% and with its lead content increased to 50 or 55%. It is expected that the double roast will effect the following improvements over present methods:

1. Avoid the large production of matte that locks up lead and requires expensive re-treatment for its recovery.

2. Avoid diluting a 65 to 70% lead-concentrate to 40 to 45%, which means large additions of barren flux.

3. Utilize to the fullest extent the fluxing components of the ore. This means that no limestone should be added to the blast-furnace charge, while some silica and iron will be required. The resulting blast-furnace slag will contain from 6 to 7% MgO with a corresponding increase in capacity for original concentrate.

4. Recover a part of the copper in the concentrate, which metal is at present mostly oxidized and lost in the large amount of slag.

The other important improvement was the mechanically rabbled hearth, known as the 'St. Louis hearth.' This was developed at the Collinsville plant of the St. Louis Smelting & Refining Co., fully described by W. E. Newman. The St. Louis hearth is applicable only to concentrate assaying 68% or more in lead, and therein differs from the H. & H. and D. & L. methods which treat concentrate of varying grades. When concentrate assays over 70%, it is considered that the hearth shows better recovery in lead, and is the most economical method, although the double roast, when perfected, promises to be equally as cheap, with the advantage of being able to treat any grade of concentrate. The peculiar advantages of the mechanical hearth for the higher grade concentrates are:

1. It treats the concentrate undiluted with flux.

2. It is a very efficient de-sulphurizer, expelling 95% of the sulphur.

3. It re-treats all the dust and fume produced, leaving the gray slag as the only product to be sent to the blast-furnace, with a large reduction in slag and matte produced.

4. The hearth makes a total extraction of 82 to 84% of the lead content of 70% concentrate. With concentrate assaying 75 to 80% lead, 90 to 95% represents the total extraction, leaving from 5 to 10% lead content in the gray slag. This practically eliminates any re-treatment of matte.

The mechanical rabbling machine is limited to 68% lead concentrate, and, for this reason, where a lower

grade of concentrate is received at Collinsville, the D. & L. machine must be used as an auxiliary. All matte produced by smelting the gray slag of the hearths and the D. & L. sinter at Collinsville can be easily handled raw on the D. & L. machine, so that a Wedge roaster is not needed for pre-roasting.

The St. Joseph Lead Co. is erecting at Herculaneum 12 St. Louis hearths to be used in connection with the double-roast process for the treatment of the excess of high-grade concentrate. In the South-East district, about 75% of the output of the mills is a high-grade product, applicable to hearth-work, the remainder being lower-grade concentrate and flotation slime. In order to sweeten the mixture for the double roast, in other words, to raise its grade, it is necessary to use a proportion of the high-grade concentrate for this purpose. The balance of the concentrate should be worked by the mechanical hearth to obtain the most economical results both as to cost and recovery.

The lead produced from Missouri ore contains few impurities, and when subjected to a single liquation can be used for all purposes except corroding. A typical analysis of Missouri un-desilvered lead is as follows: Ag, 0.0080 (2.4 oz. per ton); As, trace; Sb, 0.0030; Bi, trace; Cu, 0.0800; Fe, 0.0015; Zn, trace; Ni and Co, 0.0080; lead by difference, 99.8995. The Herculaneum and Collinsville plants de-silver part of their lead, recovering about 1 to 2 oz. of silver per ton, and producing an unusually pure lead for the manufacture of white lead and other purposes requiring a very pure lead. The following analysis of South-East Missouri refined, indicates the unusual character of Missouri de-silvered lead: Ag, 0.005; As, trace; Sb, 0.0020; Bi, trace; Cu, 0.0002; Fe, 0.0004; zinc, 0.0004; lead by difference, 99.9965. The difference from Western refined is almost entirely due to the bismuth content (about 0.05 in Western refined) from which the Missouri ores are singularly free. The refining of the Missouri crude lead for corroding purposes follows the usual practice, except that no softening-furnaces are necessary.

At Collinsville the lead from the blast-furnace is poured molten into the drossing kettle. After carefully drossing to eliminate copper as much as possible, it is pumped into a de-silverizing kettle. The hearth-lead is charged as pig directly into the kettle, drossed, and de-silverized. Zinc is added, stirred in, and the zinc-silver-lead-alloy (crust) removed. This first crust is re-worked in succeeding kettle-charges until sufficiently high in silver to be set aside. The resulting retort-bullion (lead riches) assays from 500 to 600 oz. Ag per ton, and represents a concentration of the silver-content of 250 to 300 tons of lead into 1 ton of retort-bullion. The zinc consumption per ton of refined lead produced is about the same in amount as that consumed in refining argentiferous bullion. Special attention must be given to removing copper as much as possible from the lead to be de-silverized. The quantity of zinc-silver-lead alloy made is insufficient to warrant the operations of retort and cupels, and heretofore the alloy has been sent to some outside

refinery to be separately distilled in retorts, and the returns are based on the sampling of the various products obtained, such as retort-bullion and dross, spelter, and blue-powder. The assay-results check quite closely. Retorts and cupels are being installed at Collinsville, so as to be able to treat the alloy whenever occasion demands.

## A Switch-Tongue

In constructing turn-outs in the line of track underground, either for sidings, or for branches to side workings, most miners desire to avoid the making of frogs. To do this they substitute the tongue-switch. The accompanying sketches illustrate the manner of making and operating the tongue-rail for such a switch. To hold the lug at the end of the tongue in place, a plate having

a round hole punched through it should be placed on the upper and lower face of the ties; through this the lug passes vertically. This holds the tongue in position when the pointed end is swung across to join the opposite side of the track. The tongue should be at least 8 ft. long to permit of some flexibility, or the car-wheels are likely to be bound by the rails, causing the car to jump the track. It will be noted that the outer rail of the switch is in a position parallel to the tongue when thrown across the main track, and there is consequently a jog on the outer rail opposite the end of the tongue, and another opposite the swivel-end. Thus the gauge is maintained throughout, and the likelihood of derailing cars is obviated.

COMMERCE between Spain and the United States is growing at a rapid rate. The total value of the imports from Spain in the first six months of 1916 were \$18,553,341 against \$25,291,338 for the corresponding period this year, while the exports were respectively \$38,960,413 and \$55,348,860. Among the receipts from Spain were 11,000 tons of iron ore from the province of Vizcaya in March and April.

# Modern Milling Methods Applied to Californian Gold Ores

By ALEX McLAREN

There has been, during past years, a system of gold-milling practised on the Mother Lode region of California that developed in connection with the so-called California mill, a system that through years of continual use became 'bred in the bone' of the mill-men of that region. This type of mill consisted of the stamp-battery as a pulverizing device, preceded by a crusher, and followed by amalgamating-plates and Frue-vanners. When the oxidized ores were being treated, good recovery generally resulted, but the recovery on the sulphides averaged only about 80%. The reason for this low recovery was due to a number of conditions that were mainly mechanical. The excessive quantity of fine material produced in stamping was discharged from the battery with a consistence of six or seven of water to one of solid. This worked out well as far as amalgamation was concerned, but in very few of the mills, if any, was any attempt made to either de-water or to classify the pulp for concentration. It was, instead, run over the vanners with the excess of water that was necessary to use in the battery and with the addition of more water on the vanner. This, of course, is not conducive to good concentration of either classified or unclassified pulp.

The belief was current among many of the old Mother Lode mill-men that they were getting the most from the ore that was possible, and suggestions for de-watering and classifying were generally greeted with ridicule. A few months ago I was called upon by the management of the Kromnick Mining Co. at Coarse Gold, California, to take charge of its mill with a view to bettering the recovery. It was a modern 20-stamp Californian type of mill; only 10 stamps were in use, followed by amalgamating-plates and two Wilfley tables in series. I operated the plant for eight days without making any changes, meanwhile sampling carefully to determine in just what form the loss occurred. The ore was typical of the Mother Lode, a mixture of 'ribbon-rock,' clay-slate, and quartz, yielding about 60% of its gold-content by amal-

gamation, the remainder being carried by the lead and iron sulphides. After being churned in a deep mortar and discharged through a 30-mesh screen, more than 40% would pass a 200-mesh screen. This was treated on the Wilfley tables where the excessive amount of water carried the fine particles of sulphide over the tables and into the tailing-launders. Under these conditions the total recovery during the eight days of sampling averaged 75.11%, and the loss was found to be in the material finer than 200-mesh.

The next step was either to attempt to cut down the quantity of fine, or to leave the pulverizing conditions as they were, segregate the slime, and treat it on a slime-table or on some device adapted to such work. For classification the free-settling system was used. This was accomplished in a wooden tank 12 ft. long, 4 ft. deep, 3 ft. wide at the top, and 30 in. wide at the bottom. Six spigots were provided along the side of the bottom of the tank and spaced at regular intervals. A Senn pan-motion vanner was in the mill but had not, for some reason, been used. The coarse particles of pulp were drawn from the first two spigots and treated in a thickened condition on the first Wilfley, the next two spigots on the second Wilfley, and the last two were delivered to the Senn pan-motion concentrator, using it as a slimer, inasmuch as a screen-analysis of the issue from the last

## SCREEN ANALYSIS

Screen	Mill head, %	Table head, %	Senn head, %
+ 30 mesh.....	1.14	3.71	....
+ 40 ".....	2.60	8.61	....
+ 60 ".....	10.07	23.77	....
+ 80 ".....	8.44	12.66	0.39
+ 100 ".....	13.78	13.24	5.31
+ 150 ".....	11.55	10.27	12.93

- 200 ".....	41.94	19.22	65.63
Screening loss .....	1.92	1.67	1.84

## LAST TWO SPIGOTS TO SENN CONCENTRATOR

Date	Mill head	Plate tail	Saving by amal., %	Table tail	Senn head	Senn tail	Senn recovery, %	Mill recovery, %
1917								
March 22.....	\$5.20	\$1.60	69.2	\$0.60	\$2.40	\$0.80	66.7	88.47
" 23.....	6.40	3.00	53.1	0.80	2.60	0.90	65.4	87.50
" 24.....	8.20	2.60	68.2	0.80	2.80	0.90	89.1	89.09
" 25.....	6.40	2.00	68.7	0.40	1.60	1.00	62.5	96.00
" 26.....	7.60	4.20	44.8	0.60	3.20	0.80	75.0	89.50
Average .....	\$6.76	\$2.68	60.8	\$0.64	\$2.52	\$0.88	71.7	90.11

two spigots showed 65% passing through 200-mesh and 99.61% through 80-mesh. This permitted thickening the pulp, the surplus water overflowing the end of a tank fairly clear. The spigots, being partly closed, permitted a steady flow to the concentrators with a consistence of about 30% solids. Under these conditions, the ensuing five days' sampling showed a recovery of 90.11%, being

TEXAS FLAT MILL, MADERA COUNTY, CALIFORNIA

an increased recovery of 19.9%. It was readily seen that the additional recovery was partly due to a classification, the settling being far from perfect, thus reducing the water-content of the pulp on the tables, segregating the fine and treating it separately on a Senn pan-motion concentrator. With it I found possible a large recovery from the sulphide that was previously lost. It was an exceedingly difficult case, since more than 80% of the concentrate recovered was so fine as to pass through a 200-mesh screen. The average results before making modifications in the mill, taken from the assay-sheets representing a week's run were: heading, \$8.05; plate-tailing, \$2.73; recovery by amalgamation, 58.8%; table tailing, \$1.62; table recovery, 37.8%; average total recovery for the week, 75.11%, the daily recoveries ranging from a minimum of 62.5% to a maximum of 92%. The changes made resulted in a recovery which, as shown by a typical week's run, gave an average of 89.8% extraction, ranging from 86.4 to 94.8%. The accompanying table shows the results of a five days' run, including the Senn pan-motion concentrator. The screen-analysis also reveals the conditions under which the concentrator had to operate.

The Texas Flat mine, now owned and operated by the Krromick company, was discovered in 1853, and was equipped and extensively worked by the Haggin & Hearst syndicate for several years prior to 1890. It has seen long periods of idleness and several of prosperity. The vein is from 3½ to 4 ft. wide in slate, the strike and dip of the fissure conforming generally with those of the

inclosing rocks. An adit has been run on the vein 1400 ft. and connects with the incline shaft 260 ft. vertically below the surface. The property was equipped with an electric power-plant, situated on Fresno river, three miles from the mine, which is one mile north of Coarse Gold post-office. An electric hoist has been placed at the adit-level of the shaft, which is 920 ft. deep. A 4-drill compressor and mill with twenty 1500-lb. stamps and concentrators complete the equipment. In 1914 high water in the Fresno river destroyed the dam and did considerable damage to the plant, but power is now supplied by the San Joaquin Light & Power Co. It is said that the ore contains about \$4 in free gold, and 0.5% sulphide that assays about \$100 per ton. It is claimed that the cost of mining and milling is under \$1.50 per ton.

ZIRCON is used chiefly in the manufacture of refractory crucibles and for the refractory lining of furnaces. It is therefore a material for which there may be increasing demand under the pressure that is being put on the steel industry of the United States. Silicate of zirconium, the mineral known as zircon, is found in small crystals mixed with monazite in the sands from which the Brazilian monazite is washed. In the process of recovering monazite from these sands, in Bahia, Espirito Santo, and in a smaller way in Minas Gerães and Rio de Janeiro, zircon and ilmenite are separated. As the ilmenite has no commercial value it is thrown away, but exporters claim that zircon can be marketed at \$50 per ton. With

INTERIOR OF THE TEXAS FLAT MILL

the electric separating machines now in use it is practically impossible to remove all the monazite from the zircon, and a residuum of 2 to 6% remains with it. Increasing shipments of zircon may be expected from Brazil provided it is not too heavily burdened with duties and is classified as zircon and not as monazite.

COLOMBIA shipped to the United States during the year 1916 a total of 21,645 oz. of gold, or a value of \$432,900. Of this amount 1394 oz. was in the form of cyanide precipitates, the rest being bars and gold-dust.

## California Mines in 1917

While the mineral industry of California has shown exceptional activity during the first six months of 1917, gold mining has been suffering a period of depression, according to Charles G. Yale, of the U. S. Geological Survey. He reports that the U. S. Mint at San Francisco, and the local smelters and refiners, received about the same quantity of gold and silver as in the corresponding period of 1916, proving that no advance in output has been made, notwithstanding the opening of new gold mines and the re-opening of old ones. Investigation has shown that thus far in 1917 the expenses of gold production have increased 18% over 1916, due to extra cost of labor and supplies, and increased taxation. The scarcity of skilled and unskilled labor has caused many mine-owners to hang up some of their stamps for a few months this year because they have been unable to hoist the normal quantity of ore. Machine-men have gone to munition-plants and other factories where they obtain better wages than in the mines. Good timber-men are scarce, as are good miners. Adjoining States are offering higher wages than in California, although wages have been raised in this State also. Copper mines give a bonus, based on the value of the metal, and that has also attracted men from the deep gold mines.

The California Debris Commission has been vigorously enforcing its regulations. As a result many deep mines have had to construct dams to impound the tailing so as to prevent it from passing into streams which feed the navigable rivers. All these things have combined to retard the gold-mining industry. During the first half of 1917 both the Kennedy and the Argonaut companies, the largest producers in Amador county, have exceeded a vertical depth of 4000 ft., and at that depth are mining rich ore. This is encouraging to other Mother Lode miners who have not so great a depth. In Calaveras county the indebtedness of the old Royal Consolidated mine at Hodson has been paid off, and re-habilitation of the property has commenced. The Drake group, including the Last Chance south of Angels, is about to be unwatered and worked by Eastern men. There is also activity at Mokelumne Hill, affecting the Safe Deposit, Buffalo, Hector, Lucas, Mokelumne, and Esperanza mines. In El Dorado county the Church-Union and several adjoining claims south of Placerville have been re-opened after a long period of idleness. The Placerville Gold Mining Co. has acquired 23 claims at Placerville, including the Pacific, and some have been unwatered for development. In Mariposa county, the Fremont Grant of the Mariposa Mining & Commercial Co. has been sold to a company which is about to re-open the Princeton, Pine Tree, and Josephine mines. On this tract of 44,000 acres are 71 mines which were once productive but have been idle

for many years. The Mount Gaines mine, near Hornitos, formerly a producer, but for some years idle, is being put in shape for re-opening; and the Mary Harrison, near Bagby, is also being re-habitated. At the Red Bank a flotation-plant has been installed. In Tuolumne county the Eagle Shawmut mine, with its 100-stamp mill and chlorination plant, has been purchased by the Tonopah-Belmont Mining Co., and will again become productive, the main shaft, now down 2200 ft., being deepened to explore the main orebody.

In Inyo county there is much activity around Keeler and Darwin. The Cerro Gordo properties are producing large quantities of zinc. The Darwin Development Co., after proving the efficiency of the flotation-process on the Lane and Lucky Jim mines at Darwin, has purchased the Defiance mine and the water-rights at Coso. In and around Zabriskie there is activity in silver-lead mining. In Mono county the Masonic district has again displayed new life. An ore-shoot of high-grade gold and silver ore has been discovered in the Pittsburg-Liberty mine by lessees. The Serita company has enlarged its milling activities, and has also increased its water-supply for the electric power-plant. In Nevada county the new mill on the Allison-Ranch mine has been completed and is running. This was formerly a heavy producer. The North Star Mines Co. at Grass Valley continues to produce heavily, the richer ore coming from below the 600-ft. level on the incline. This company has recently acquired the Rogers mine near Washington and has started work. More stamps have been added to the Golden Center mill at Grass Valley. The Empire Mines Co. continues to operate the most productive deep gold mine in the State. The Valley View mine in Placer county has been sold to the H. C. Winters Co. of New York. Machinery has been ordered, and an electric-power line is being constructed.

Goldstone is a new district in San Bernardino county, where developments are encouraging. The Goldstone Mining Co. has completed its mill, and the Belmont, Red Bridge, and other gold claims are being developed. In Sierra county work has been resumed on a number of properties in the Downieville region. The Shamrock mine, adjoining the Sierra Buttes, at Sierra City, has been sold to San Francisco men and is being re-opened. The Plumbago and Oriental mines of the Croesus Mining Co. are having extensive development work done; in Siskiyou county, the Dewey mine, after an idleness of eight years, is again in operation, and an electric-power plant has been provided. In the region around Happy Camp numerous gold and copper properties are receiving attention from New York and Philadelphia people. The Bonanza King mine, near Trinity Center, Trinity county, is again producing.

The gravel-mining industry of California, including

dredge and hydraulic operations, is in a more prosperous condition than quartz mining. Some features of the latest style of dredge put into operation this year by the Yuba Consolidated Goldfields in Yuba county, are of interest. The capacity is 350,000 cu. yd. of gravel monthly, with an estimated working cost of 3½c. per cu. yd. The dredge-buckets hold 18 cu. ft. each, and the machine will dig to a depth of 84 ft. below the surface of the pond. This machine will move boulders weighing four tons and will remove roots and trunks of trees embedded in the gravel. The dredge cost nearly \$500,000. It has two tailing-stackers, each 220 ft. long, stacking on each side so as to leave a 500-ft. channel. Another dredge will dig a channel 500 ft. wide to comply with the requirements of the California Debris Commission for a 1000-ft. channel. A large dredge, of similar design, to cost \$600,000, has been started this year. In Trinity county the Pacific Gold Dredging Co. started operations early this year in the Carrville district. The buckets of the dredge have a capacity of 9 cu. ft., and the machine digs 60 ft. below the water-line. The Trinity Star Dredging Co. is building a wooden dredge on the Trinity river on the Paulsen ranch near Lewiston. The Trinity Gold Dredging Co., owning the old Alta Bert dredge, has contracted for a second dredge with 82 buckets of 18 cu. ft. capacity each. The company owns 3600 acres of dredging ground. The Gardella Dredging Co. is preparing to build a second dredge on Clear creek, near Redding, where it already has one in successful operation. A third dredge is to be constructed by the American Dredge Co. on the Mokelumne river, near Camanche, Calaveras county. In hydraulic mining, activity has been greater than for many years in California. The new big concrete impounding dam across Slate creek in Sierra county will permit hydraulic mining again at Howland Flat, St. Louis, Port Wine, and a number of other old-time placer camps, which have been virtually deserted. Many old abandoned hydraulic mines in the Cherokee and Columbia Hill districts of Nevada county, and other places, are being tested with a view to re-opening them and starting the giants. Experiments are being made in drift mines in Butte county, with a view to mining the gravel of the buried rivers by machinery instead of by hand.

The mining of copper, lead, and zinc in California, thus far in 1917, has been more active and prosperous than gold mining. As usual the larger proportion of the copper output comes from Shasta county, although Calaveras and Plumas are large producers. The Afterthought mine at Ingot, Shasta county, after being closed nine years, has resumed activity and is being equipped with a flotation-plant and a roaster. The Minnesota mine, near Keswick, after 20 years of idleness, has been re-opened by the Mountain Copper Co. The same company has also opened the Keystone group of copper claims on Flat creek, in the same vicinity. The Balaklala Copper Co. is active and shipping ore. The elec-

trolytic zinc-plant of the Mammoth Copper Co. has been completed and put in operation. The Arps Copper Co., adjoining the Bully Hill, in Shasta county, has placed orders for hoisting machinery, compressor, and drills, preparatory to deeper development. The Copper King mine, at Clovis, Fresno county, long idle, is under new management and began to ship ore last May to the Mammoth smelter. In Calaveras county a converter has been installed at the smelter of the Penn Mining Co. so that blister-copper will be shipped hereafter instead of matte. Electric power has been substituted for steam throughout the plant. More units are being added to the flotation-plant of the Calaveras Copper Co. in the same county. In Plumas county, the Indian Valley railroad is operating between the Engels Copper mines and Paxton, on the Western Pacific railroad. The capacity of the flotation-plant at the mine has been increased. The International Copper Co. is making large shipments of copper ore from Taylorsville to the Tooele smelter in Utah. The United States Smelting & Refining Co. is increasing its activities in Plumas county. In Siskiyou county the Gray Eagle Copper Co. has repaired its roads in Happy Camp, and has several diamond-drills at work. The Hunters Paradise copper group has been bonded to the Mason Valley Mines Co., with a view to prompt development.

## Advance in Electric Steel Production

Great strides have been made within the last three or four years, and particularly last year, in the production of steel in electric furnaces both here and abroad. Great Britain last year more than doubled her output of 1915. Canada stepped into prominence by making more electric steel last year than has ever been made in France, the originator of the electric furnace. Austria-Hungary, under war conditions, also doubled her production last year over the output for 1915. The leading countries producing electric steel last year turned out more than twice as much as was made in the previous twelve months. The extent to which electric steel is being made since the War began is given in gross tons in the order of importance in 1916, as follows:

	1916	1915	1913	1912
Germany .....	180,335*	129,000	101,755	74,177
United States .....	169,918	69,412	30,180	18,309
Great Britain .....	49,256	22,000	.....	.....
Austria-Hungary† ...	47,247	23,895	26,837	21,556
Canada .....	43,790	61	.....	.....
France .....	.....	.....	18,000*	15,922
Total .....	490,546	244,368	176,772	129,964

\*Estimated, metric tons.

†Metric tons.

It is estimated that the electric steel output of the United States is now at the rate of 200,000 tons per year and by January 1, 1918, with the prospective furnaces already contracted, it will reach 300,000 tons.

## Recent Patents

1,232,572. MINER'S CARBID-LAMP. Ronchi Lazare, Portage, Pa. Filed Apr. 26, 1917.

1. In a miner's lamp, a cylinder, heads closing the opposite ends of the cylinder, a partition wall extending vertically through the cylinder, a horizontal partition wall between one side of the first-mentioned partition wall and the cylinder, a carbide receptacle formed by the horizontal partition wall and the vertical partition wall, a water receptacle formed above the horizontal partition wall and carbide receptacle, said vertical partition wall having an opening in its upper edge, whereby communication is established between the water receptacle and the remainder of the cylinder, a valve controlling the flow of water from the water receptacle into the carbide receptacle, a valve extending through the cylinder for controlling the flow of water therefrom, a main carbide receptacle adapted to be secured to the under side of the cylinder, burners mounted on the side of the cylinder, and tubes leading to the burners for conducting the gas generated by the mixture of the carbide with the water to said burners.

1,232,156. PROCESS FOR OBTAINING POTASSIUM CHLORID FROM CERTAIN WATERS CONTAINING BORAX. Noah Wrinkle, Keeler, and Wilfred W. Watterson, Bishop, Cal. Filed Dec. 11, 1916.

2. The herein described method of obtaining potassium chlorid from waters containing the same and sodium borate, sodium chlorid and other salts, embodying first eliminating the other salts and concentrating to obtain a solution high in the three named salts, treating the solution with an acidifying agent to form boric acid, concentrating the solution by heat to deposit the named salts and acid, treating the mixed salts with alcohol to dissolve the boric acid formed and separating the solution thus formed, and washing out the sodium chlorid from the remaining mixture of sodium chlorid and potassium chlorid with clear cold water, leaving the potassium chlorid.

8. The herein described process of treating water containing potassium chlorid, sodium borate, sodium sulfate, sodium carbonate, and sodium chlorid, embodying first treating the liquor with carbon dioxid to transform the carbonate to an insoluble bicarbonate and removing the liquor therefrom, then heating and evaporating the liquor to concentrate it to the saturation point of potassium chlorid at ordinary temperatures, then treating the liquor further with carbon dioxid to remove further sodium carbonate and then cooling to deposit sodium borate and removing the liquor, then further concentrating the liquor by evaporation to the saturation point of potassium chlorid at the temperature employed, then cooling the liquor to deposit the contained salts, removing the liquor to be returned to an original liquor being treated, re-dissolving the mixed salts in clear water, treating the solution with chlorin to form boric acid and sodium chlorid from the sodium borate, concentrating the solution and depositing the salts and boric acid therefrom, removing and treating the mixed deposit with alcohol to dissolve the boric acid and removing the solution, and washing out the salts with clear cold water leaving undissolved the potassium chlorid.

1,232,830. METHOD OF MAKING CATALYTIC MATERIAL. Charles Burrows Morey and Charles Rollin Craine, Buffalo, N. Y., assignors to Larkin Company, Buffalo, N. Y. Filed Feb. 2, 1916.

1. The method of producing a catalyzer consisting of mixing an absorptive non-catalytic material with an insoluble compound of a catalytic agent, removing from the interstices of said absorptive material the moisture and gases contained therein and causing said compound to enter into said interstices to form a secure bond between the same and said compound, drying the mixture and reducing the same.

2. The method of producing a catalyzer consisting of forming a suspension in a liquid of an insoluble compound of a catalytic agent, mixing an absorptive non-catalytic material with said suspension, removing from the interstices of said absorptive material the moisture and gases contained therein and causing said compound to enter into said interstices to form a secure mechanical bond between the same and said compound, drying and reducing the same.

1,232,471. CYANID IN THE FORM OF GRANULES. Fritz Abegg, Perth Amboy, N. J., assignor to The Roessler & Hasslacher Chemical Co., New York. Filed June 23, 1914.

1. As a new article of manufacture, cyanid in the form of a hollow granule.

2. As a new article of manufacture, cyanid in the form of a hollow granule, open at one end.

3. As a new article of manufacture, cyanid in the form of a hollow granule, open at one end, and glazed on both its outside and inside.

4. As a new article of manufacture, sodium cyanid in the form of a hollow granule.

5. As a new article of manufacture, sodium cyanid in the form of a hollow granule, open at one end.

1,232,080. PROCESS OF RECOVERING COPPER. Frederick J. Pope and Albert William Hahn, Douglas, Ariz. Filed July 29, 1914.

1. The improved cyclic method of extracting copper from copper-bearing material whose copper content is soluble in a sulfuric acid solution, comprising the leaching of the material with a solution of sulfuric acid, whereby the copper is converted into copper sulfate in solution, electrolyzing the solution containing the copper sulfate and regenerating sulfuric acid, returning the solution to the ore, and at some point in the circuit of the solution, when it becomes foul withdrawing a portion of the solution from the circuit, predetermined in amount in accordance with the amount of impurities necessary to be removed from the solution as a whole, eliminating impurities from the portion so withdrawn and returning it, purified, to the circuit.

4. The improved cyclic method of extracting a metal from an ore containing it in cases where the metal content is soluble in an acid solution, comprising the leaching of the ore with a solution of such acid whereby the metal is converted into a soluble salt of the metal, electrolyzing the solution containing the salt, returning the solution to the leach, and at a suitable point in the circuit of operations, when the solution becomes foul withdrawing a portion of the solution predetermined in amount in accordance with the amount of impurities necessary to be removed from the solution as a whole, eliminating impurities from the portion so withdrawn, electrolyzing, and returning it purified for further use in the cycle.

1,232,772. METHOD OF AND MEANS FOR RECOVERING METALLIFEROUS MINERALS BY FLOTATION. George Crerar, Spokane, Wash., assignor of sixty one-hundredths to James L. Boyle, Los Angeles, Cal. Filed Mar. 9, 1915. Renewed Nov. 27, 1916.

4. The method of recovering metalliferous minerals from ore pulp which consists in converting the pulp into froth; subjecting the froth to the uplifting and drying action of finely divided air currents; causing the froth to flow toward a place of separation meanwhile spreading the froth over a wider area, at the same time deepening the body of froth and subjecting said deepened body to the continuous action of such air currents forcing the surface froth to separation; drawing of frothy material from below the surface of said deepened froth body and the frothy material thus being drawn off.

5. The apparatus for recovering metalliferous minerals from ore pulp treated with a frothing agent which comprises a sloping porous deck, means to supply the treated ore pulp to the upper end of the deck; means to force air up through the deck to froth the pulp thereon; separating means for collecting a body of froth of considerable depth at the lower end of the deck; said means terminating at a level intermediate the levels of the upper and lower ends of the deck; means to force air up through such deep froth body; and means to draw tailings off at the bottom of such deep froth body.

THE PATENT OFFICE, WASHINGTON

1,232,840. SHOT-FIRING DEVICE. Elmer Porphir, Pittsburg, Kan. Filed May 4, 1916.

1. A multiple charge firing device comprising a polysided liquid receptacle, a series of vertically spaced contacts passing through one side of said receptacle for connecting current conducting wires, the inner ends of said contacts being in the form of rounded heads, a float movable vertically in said receptacle, a contact plate having its outer end directed upwardly to form a contact for engagement with said series of contacts, and having means for attaching a current conducting wire thereto, said float being of a shape corresponding to the polysided shape of the receptacle to prevent rotation of said float and to thus maintain the contact plate and the series of contacts in alinement, and a valve at the lower end of said receptacle for preventing the escape of liquid and supporting the float above said series of contacts until the charges are to be fired and for then permitting the escape of such liquid.

1,233,118. ALLOY TOOL-STEEL. James Heber Parker, Reading, and Berton H. De Long, Springmont, Pa., assignors to Carpenter Steel Company, Reading, Pa., a Corporation of Pennsylvania. Filed June 26, 1916.

1. A tungsten-steel having a base composed of between 30% and 45% of cobalt and between 55% and 70% of iron, said compound constituting the bulk of the alloy and the tungsten between 8% and 20% thereof.

2. An alloy tool-steel composed mainly of iron and cobalt proportioned approximately two of iron to one of cobalt, 8% to 20% of tungsten and .5% to 2.5% of vanadium.

3. An alloy tool-steel composed mainly of iron and cobalt proportioned approximately two of iron to one of cobalt, 8% to 20% of tungsten and .5% to 2.5% of vanadium and 1% to 6% of chromium.

1,232,362. ELECTRIC FURNACE. Claude G. Miner, Berkeley, Cal. Filed Feb. 17, 1917.

4. An electric furnace, outer and inner spaced walls and heat insulating material in the space between said walls; said furnace formed interiorly of said inner wall with a reaction chamber having the shape of two opposed paraboloids; and a crucible composed of conducting material in the principal foci of paraboloids, said crucible constituting a centre electrode for two arcs in series.

10. In an electric furnace, a body having outer and inner spaced walls and having the space between said walls filled with heat insulating material; said body formed interiorly of said inner wall with a cavity, and a crucible in said cavity, said crucible constituting a common electrode for two arcs in parallel.

THE PATENT OFFICE, WASHINGTON

1,233,086. ORE-GROUNDING MILL. Peter A. MacEachern and Nolen O'Daniel, Douglas, Ariz. Filed Aug. 12, 1916.

In a mill of the character specified comprising complementary members, each having radial ribs on its outer face, and parallel circular ribs on its inner face, the circular ribs of the two members coinciding, half-round runways placed between the circular ribs of the members and touching the members on medial lines and having outer flanges at their edges to overlap and bear against the ribs, and balls arranged in the runways.

THE PATENT OFFICE, WASHINGTON

1,228,414. METHOD OF SEPARATING AN AROMATIC SULFONIC ACID AND OBTAINING THE SULFONIC ACID IN SOLID FORM. Louis M. Dennis, Ithaca, N. Y. Filed Nov. 20, 1916. Serial No. 132,339.

3. A method of separating a sulfonic acid of a hydrocarbon of the aromatic series from sulfuric acid and of obtaining the sulfonic acid in solid form, consisting in treating a mixture of the acids with an organic solvent which dissolves the sulfonic acid but not the sulfuric acid and which dissolves an appreciably greater amount of the sulfonic acid at high temperature than it does at low temperature, separating the sulfonic acid solution from the sulfuric acid and cooling said solution.

# REVIEW OF MINING

*As seen at the world's great mining centres by our own correspondents.*

## BRITISH COLUMBIA

**THE SMELTER AT LADYSMITH BLOWN-IN AFTER AN IDLENESS OF SIX YEARS.—SMELTER RATES COMPARED WITH THOSE AT THE TACOMA SMELTER.**

After being closed down for five years the smelter at Ladysmith, on Vancouver island, has been re-opened. The 20,000 tons of ore necessary as a supply before the furnaces could be blown-in has been collected.

This is one of the most important events in British Columbia mining developments since the War started and will go a long way in fostering and maturing the mining activity on the island, as well as in other parts of the province.

One of the great advantages of the smelter will be its arrangements for treating local ores. The plant is of sufficient capacity to handle the entire output of the island for many years to come, and present and prospective owners will be able to proceed with development work in full confidence of having adequate smelting facilities.

It was in 1901 that the smelter, then known as the Tyee smelter, was erected. It was built at Ladysmith because of the advantageous position, cheap transportation rates being available from most parts of the province.

The plant was closed-down in the latter part of 1911 and has remained idle ever since. Last autumn it passed into the hands of the Ladysmith Smelting Corporation, which company has made many contracts for ore that will ensure constant operation.

The president of the company is Colonel Stevenson, who has long been associated with important mining interests in British Columbia and in Alaska. He is one of those controlling the Alaska Corporation, which operates in conjunction with the Ladysmith smelter. H. W. Aldrich is superintendent of the plant.

Naturally there is deep interest in mining circles as well as among business men generally as to the effect the operation of the smelter will have upon the movement of ore into the United States. At present large quantities are shipped to the Tacoma smelter and it appears likely that a considerable proportion of that ore will in future be sent to Ladysmith.

The Ladysmith corporation has announced a treatment charge of \$5 per ton. The copper will be paid for on a basis of 100%, but a deduction of 0.4% will be made from the wet assay.

The price paid for copper will be 3c. per lb. less than New York quotations 90 days after the receipt of the ore; 95% of the gold content will be paid for at \$20 per oz., but if there is less than 0.1 oz. per ton it will not be paid for; 95% of the silver will be paid for at New York quotations 90 days after sampling, but the ore must assay over 0.5 oz. in order to be paid for.

An advance of 60% of the value of the ore at current prices will be made, but the shipper must pay 7% interest for the advance.

Tacoma, with which Ladysmith is in direct competition, issues two schedules, of which the shipper may make his choice. The charge for treatment is \$1.50 per ton, \$3.50 less than the Ladysmith rate.

In both Tacoma schedules 95% of the gold and silver content is paid for, but no gold under 0.3 oz. or silver under 1 oz.

per ton is paid for. On this point the Ladysmith terms are better.

Under schedule A, of the Tacoma smelter, 100% of the copper is paid for after deducting 1.3 for wet assay. When copper is quoted higher than 14c. per lb. only 75% of the excess is paid for—which means that the smelter claims 25% of all the copper value over 14c., after deducting 1.3 for wet assay and 3c. per lb. in addition.

Under Schedule B, of the same smelter, the same percentages of value are allowed, but preliminary settlement will be made on the basis of copper at 14c. and silver at 55c. Final settlement will be made 120 days after sampling, on the basis of the average New York quotations for a week prior to the expiration of the 120 days.

If the final quotation is in excess of 18c. per lb. for copper the treatment charge is advanced from \$1.50 to \$2.50 per ton. Any shipments under five tons are charged \$10 flat for sampling in addition to the treatment charges and reductions.

A comparison of the Ladysmith and Tacoma rates shows that the former is generally the most favorable.

## COBALT, ONTARIO

**BULLION OUTPUT.—NIPISSING.—TRETHERWEY SILVER-COBALT COMPANY.**

Bullion shipments during the second week of July from the Cobalt camp were heavy; Mining Corporations alone sending out a little over 250,000 oz., and with 113,571 oz. to the credit of Nipissing. Ore shipments were about the average, Nipissing with 4 cars heading the list. For the seven months ended July 31, Nipissing has mined ore of an estimated net value of \$1,765,167, made up as follows:

January .....	\$173,988
February .....	271,527
March .....	256,953
April .....	259,082
May .....	261,663
June .....	269,469
July .....	272,490
Total .....	\$1,765,167

It will be noted that the July record is the highest for any one month during the current year, and that since March the output has showed a steady increase.

Unusual light promises to be thrown on the affairs of Temiskaming in that certain sharerholders of that company have suggested that a report, other than that of the management which was comparatively unfavorable, be made by a disinterested party. A special examination by B. Neilly, superintendent of the Penn-Canadian mine, is now under way and will be ready for the shareholders at an early date. It is the consensus of opinion that there will be very little difference shown between the estimate of the management and that of the special report.

A dividend of 5% has been declared by the Tretthewey Silver-Cobalt Co., payable August 31 to shareholders of record August 20. The disbursement amounts to \$47,272, making the total paid to date by that company \$1,159,270.50.

With the price of silver holding well above 80c. per oz., the

mine-workers in the silver mines are beginning to count on the extra bonus of 25c., which is to be paid them when the average for any one month is above 80c. per oz. Also, ground which hitherto was considered to be too low grade, or containing only inconsistent amounts, is now likely to come in for serious attention. Already owners of such ground are growing restless, and with the arrival of fall, provided the high quotation for the white metal continues, the number of active properties in the camp will probably increase.

### MANHATTAN, NEVADA

WHITE CAPS DEVELOPMENT.—UNION AMALGAMATED.

The reduction plant at the White Caps mine has reached the final stage of completion and the wheels are practically ready to turn and commence the production of gold bullion.

The weekly report of development: On the 300-ft. level the east cross-cut has been advanced 31 ft., cutting several joints which gave good assay-values. The west cross-cut was advanced 40 ft. in quartzite. On the 400-ft. level the raise on the west orebody was put up a distance of 25 ft. and shows a full face of \$30 ore.

A large station is being cut in the east orebody where an electric hoist will be installed to facilitate sinking the winze to the 350-ft. level.

On the 550-ft. level a station is being cut on the north side to accommodate a large station pump and sinking-hoist, also a working-station on the south side. The dimensions of the working-station will be 8 to 15 ft. high, 11 ft. wide, and 50 ft. long. The ground is solid quartzite and will not require timbering.

Work at the Union Amalgamated has been confined principally to cutting a large station on the 600-ft. level to accommodate the new tri-plex sinking pump. The new pump will have a capacity of 125 gallons per minute under a 1400-ft. vertical head and will handle the maximum flow anticipated for several hundred feet additional depth.

A new ore-shoot panning from \$75 to \$200 has been discovered close to the surface on the top of Mustang hill, at the Mustang mine. The oxidized shoot on the 225-ft. level of the lease workings shows more quartz carrying coarse gold. The sulphide shoot still maintains its high value. An excess of water caused by the late heavy rains has prevented the exploration of the lower workings of the company shaft.

### HOUGHTON, MICHIGAN

INCREASE OF CAPITAL STOCKS OF NEW CORNELIA.—REPORTS FROM MINES.

Shareholders of the New Cornelia met yesterday at the offices at Calumet and voted to increase the capital stock from 1,203,800 shares to 1,800,000 shares, the vote being practically unanimous, 1,120,400 shares being present and voting for the proposition. The increase in stock will provide for the purchase of seven patented claims and 52 unpatented claims, comprising 1150 acres, covering the extension of the New Cornelia orebodies and providing additional ore reserves for the New Cornelia, estimated to be 21,000,000 tons of 1.55% ore in extent. Calumet & Arizona owns 76% of the stock of the New Cornelia and this stock all was in favor of the increase in capital. An issue of 200,000 shares will be made and \$500,000 in cash will accompany the stock to pay for the new claims. The half million in cash will be made in two payments, \$250,000 in six months and the balance in one year, all bearing interest at 4%. The cash with the stock valuation and other costs makes the additional property come to approximately four millions.

CALUMET & HECLA. Rock output for July was 270,000 tons and will run close to 300,000 for August. This company has

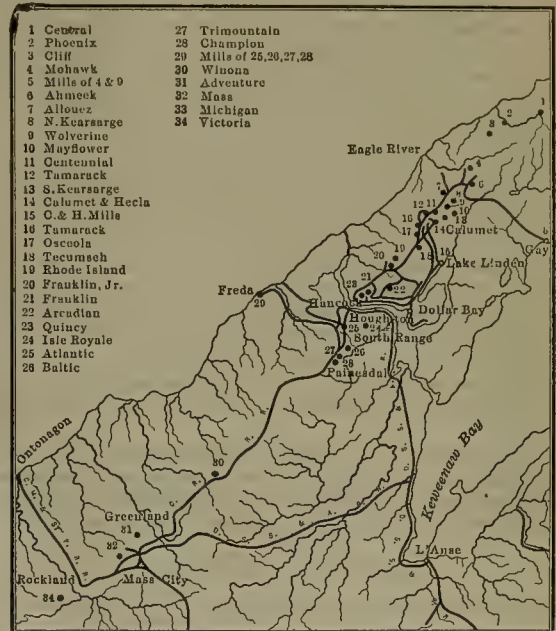

less trouble in keeping workmen than any other in the district.

QUINCY. Rock output for this month will run over 100,000 tons and copper output for third quarter of this year will break previous records, as a larger amount of copper is coming from rich mass opened at 6800 ft., a production 'fatterer' that comes in very handy with the present metal prices.

KEWEENAW. Property keeps one stamp-head busy and is slowly adding to its working-force.

ARMEEK. August output of this mine may reach 110,000 tons of rock.

SOUTH LAKE. Production ought to reach 10,000 tons in August, as 3500 tons already has gone to the mill this month.

MICHIGAN COPPER REGION

That is better than the total for July and the rock is better in copper content.

VICTORIA. Four levels are furnishing a good grade of rock for the mill, where improvements are being made that will result in further economies of operation.

ADVENTURE. Parsons Todd and C. D. Hancette of the Adventure management have returned from a visit to the property. Adventure will this month ship 90 cars of copper rock of a good average grade. The shaft now is unwatered to the eighth level and good milling rock has been opened from this shaft on the series of formations, including the Evergreen, the Butler, and the North Butler. The management has decided that it will not be necessary to open the second shaft, as good ground can be economically mined from the present working-shaft.

### ELY, NEVADA

NEVADA CONSOLIDATED.—MISCELLANEOUS MINING.

The Nevada Consolidated is milling about 14,000 tons per day, better than 3000 tons per day coming from the Ruth underground workings, the balance from steam-shovel operations. Only one-half of the new crushing-plant is in operation. It was found necessary to strengthen and re-inforce some of the structural parts. Several drills are on prospect work and are developing new orebodies, several million tons having been developed during the year.

The Consolidated Copper Mines (old Giroux) has not yet put the second unit of the mill in operation. The underground work, from the New Giroux 1445-ft. shaft on the tenth level is exposing good ore; one body shows 60 ft. in width of 11% copper. Some of the finest specimens of 'ruby' copper, cuprite crystals, and native copper are being found.

The old Ward mine is continuing development and shipments of 30 to 40 tons per day; the company has let a new ore contract, and some expected new trucks will materially increase the output. Osterlund and associates are shipping a car of lead-silver ore from Hamilton; they recently have found 5 ft. of sand carbonate, assaying about \$100 per ton. Witcher and Dan McDonald have recently shipped a carload of 75% lead ore from a new discovery known as the Miller property, a few miles north of Sacramento pass, in Snake range, the ore going out to the Deep Creek railroad.

Lacey and Clary have just received returns of a car from their Red Hills mine, in the north-east corner of White Pine county. The ore returned 57% lead and 26 oz. silver per ton, shipment from Currie, on the N. N. R. R.

Several lessees in the Robinson district ship an occasional car of lead-silver ore. H. S. Williams is doing a little work in the tunnel on the Smoky Development Co.'s ground just above Lane City. There is but little movement in tungsten in this county to date. A few men are working on the Minerva and U. S. Tungsten Co.'s properties. The prices do not warrant much development. There are two tonnage propositions which, if sufficiently large milling capacity were obtainable on the ground, would pay at present or lower prices.

There is much unrest with the labor element. A large meeting of the trainmen and associated unions was held last week at Ely.

A new compressor and other machinery are being installed at the Red Top. As soon as the compressor is ready to run, a station will be cut on the 100-ft. level on which the Deming triplex pump will be installed and sinking resumed.

### OATMAN, ARIZONA

**BULLION PRODUCTION FOR JULY.—MONTHLY PRODUCTION RECORDS OF UNITED EASTERN AND TOM REED MINES.**

Gold bullion production during the month of July in the Oatman mining district was the largest ever turned out in the history of the camp. Over \$225,000 in gold was shipped to the U. S. Mint in San Francisco from the United Eastern and the Tom Reed, the two producing mines.

The United Eastern treated 7324 tons during the month, of a gross value of \$175,898, or \$24.01 per ton. This is the highest average value ever attained by the United Eastern. Average extraction for the month was 96.47%, total operating costs \$6.68 per ton and net profits \$120,802.

For the first seven months of operation the United Eastern has mined and milled 44,889 tons, having a gross value of \$969,395 or \$21.59 per ton. Total operating costs, including loss in tailing, were \$357,455 leaving total net profits of \$611,940. July and August dividends of 5c. per share each, amounting to about \$68,000, have been paid. Monthly dividends at this rate will be continued for the rest of the year.

The Tom Reed Gold Mines Co. for July treated 7630 tons of a gross value of \$58,000, or about \$8 per ton. Total bullion produced was \$54,500. Total mining and milling costs were \$4.75 per ton, to which should be added about \$1 for administration, depreciation, and development. Average extraction for the month was about 97%.

It is expected that both the United Eastern and Tom Reed will be able to maintain this rate of production for the next few months. Within sixty days the United Eastern will have added 50% to the capacity of the mill and expects to treat 10,000 tons monthly.

Active development work on the Big Jim Consolidated and

the Red Lion was started within the past few days. On the former, A. G. Keating, the manager, was unable to secure a suitable compressor engine within reasonable time, so he bought a six-cylinder 60-hp. automobile engine recovered from a wreck, installed it in the engine room, connected it with the Imperial type Ingersoll-Rand compressor, and is securing excellent results. Not only is air furnished for the drills, but for a 300-gal. per min. pump as well. At the Red Lion a complete plant is being installed, including an electric generator, which will furnish light for the underground work as it progresses.

### PORCUPINE, ONTARIO

**HOLLINGER.—MCINTYRE.—DOME.—PORCUPINE CROWN DISCONTINUES DIVIDENDS.—MILL CONSTRUCTION AT SCHUMACHER.**

In the gold camp, Hollinger and McIntyre continue to occupy their usual strong position. The individual system with regard to a straight wage of \$4 per day to all underground employees at this mine appears to be working very satisfactorily and development work is going forward at a rapid rate. As a consequence, Hollinger ore reserves are steadily improving and the physical condition of the mine each day is growing stronger.

McIntyre is also being developed at the maximum. Production also, in sharp contrast to any other gold mine in the country, is at high pitch. It is a remarkable fact that during July the McIntyre treated 15,365 tons of ore, which is a new high record for any one month in the history of the mine, and compares with 14,455 tons in June. During the first seven months of the current year this company has treated 101,449 tons from which \$1,011,393 in gold bullion has been recovered.

Dome is treating a large tonnage, but mill-heads are comparatively low, due to the fact that sufficient men are not available to mine and hoist ore from the lower or higher-grade parts of the mine.

Porcupine Crown has decided to discontinue the payment of dividends until a return to more satisfactory labor and supplies. The management, however, intends to conduct an aggressive development campaign, and will operate the mill only at sufficient capacity to pay expenses of operation. The directors have just issued a statement pointing out that during the first half of the current year a total net profit of \$120,305.98 was realized, thus leaving a surplus of \$305.98 above dividend requirements. To do this, however, it was necessary to allow a falling off in development work, which condition, it was decided, must be avoided, and toward which end further dividend disbursements will only be resumed when sufficient manpower is available to keep up both branches of the work. The total surplus now on hand at the Porcupine Crown amounts to \$277,390.91. Mill construction at the Schumacher is being rushed and at this mine operations will shortly be resumed.

### SPOKANE, WASHINGTON

**PHILIPSBURG BOOM DUE TO DISCOVERY OF HIGH-GRADE MANGANESE ORE.—NORTH-WEST SHIPMENTS TO TRAIL.—MAGNETITE IN STEVENS COUNTY.—REPUBLIC.**

A tale of a mining town that has 'come back,' as a result of the War is told by J. E. VanGundy, Montana representative of the United States Steel Corporation, now in Spokane. The town is Philipsburg, which 20 years ago was known as a heavy silver producer. The silver deposits dwindled and the town has virtually been off the mining map for many years. But manganese ore, exposed in large quantities during the silver workings, has brought the camp back to its own. Mr. VanGundy describes conditions: "Philipsburg is experiencing an era of activity surpassing even that of the silver-boom period.

Increased production of all mines in the North-West, due

Directors of the Richmond Mining Co. have declared a 2c. dividend, payable September 5. This amounts to \$16,800 and is the fourth regular monthly dividend this company has paid. It will make its total disbursements \$67,200. The property is in the East Coeur d'Alene. The regular quarterly dividend of \$32,000 has been declared by the directors of the Utica Mines, Limited, operating in the Slocan district, B. C. This is at the rate of 2c. per share. Payment will be made September 15. A dividend of \$32,000 was disbursed on June 15 last.

PHILIPPINE ISLANDS

Two dividends of 5% each have been paid in 1917, and it is the expectation that two more at least will be paid before the close of the year. Physical condition of mine is very good. Stock of principal supplies on hand is sufficient for about a year.

# THE MINING SUMMARY

*The news of the week as told by our special correspondents and compiled from the local press.*

## ALASKA

(Special Correspondence.)—The concentrates from the Alaska Jualin Mines Co. and the Chichagoff Mining Co. will soon be treated at the cyanide plant of the Alaska Treadwell Co. The cyanide plant at present is treating the concentrates from the Ready Bullion and the 'clean-up' from the various mills. An appreciable saving to these companies both in freight and treatment costs will result. A large pocket of high-grade ore was recently encountered at the Chichagoff mine. It is stated that for a day and a half the mill was kept busy milling ore which ran from \$900 to \$1100 per ton and the mill-men were forced to clean the plates every hour during that time. It is also reported that the general average of the ore being developed in the Chichagoff is higher than formerly.

W. S. Peckovich, owner of a group of mining claims at Funter bay, has secured a large amount of mining machinery and will commence the development of his property at once. He has put a crew of 15 men to work and will install the machinery as speedily as possible. H. McGuire of New York has been examining properties on Iron creek, a tributary of the Talkeetna river, near the Government railroad running inland from Anchorage. The showing there is said to be low-grade copper in veins from 5 to 200 ft. wide.

The copper mines in the vicinity of White Horse and Caribou are busy shipping ore. At the present time there is 1000 tons of sacked copper ore from the Vallerie mine on the dock at Skagway awaiting shipment to the Granby smelter. The Pueblo mine, which has been closed since the cave-in last fall, is being re-opened. Sixty men are at work in the mine, the old shaft has been pumped out, and an effort is being made to re-open the mine through the old workings.

Treadwell, August 12.

## ARIZONA

### GILA COUNTY

Inspiration Con. Copper Co. resumes operations at Miami on a limited scale.

### GREENLEE COUNTY

(Special Correspondence.)—A fire was discovered in the Coronado mine of the Arizona Copper Co. All efforts to extinguish it have been unsuccessful. No damage is reported.

Metcalf, August 25.

### MARICOPA COUNTY

(Special Correspondence.)—The mill of the Arizona Molybdenum Co. is operating. It has a capacity of 50 tons and is situated nine miles north-west of Wickenburg. It is producing 1500 lb. of concentrate per day working one 8-hour shift. The capacity is expected to be doubled, and the production of concentrate will be 6000 lb. per day, assaying from 18 to 20% molybdenum trioxide.

Phoenix, August 9.

The Mazatal quicksilver district in the mountains of the same name, about 70 miles north-east of Phoenix, Arizona, is coming into renewed prominence. The Sunflower cinnabar mine has recently shipped 10 flasks of 75 lb. each. The property is being operated by C. N. Sears, who organized the Sunflower Cinnabar Mining Co. in 1913. Sears is installing a 12-nest retort of the Johnson McKay type. The quicksilver re-

sources of the district were reported upon by F. L. Ransome in Bull. 620-F of the U. S. Geological Survey.

### PIMA COUNTY

(Special Correspondence.)—The sinking of the two-compartment 200-ft. shaft of the Hecla-Arizona company in the Twin Buttes district is progressing at the rate of 5 ft. per day and is now down 75 ft. The shaft will be completed to 200 ft. before any driving or cross-cutting is done. Two other shafts will be started within a short time.

Thirty men are employed at the Hecla-Arizona. K. M. Said, the superintendent, announces that plans for a million dollar leaching plant, which it is proposed to erect on the property in the near future, are in Tucson. The proposed plant will serve mines in the Twin Buttes district, the San Xavier, the San Xavier Extension, the Empire Zinc, the Vulcan, the Mineral Hill, the Paymaster, and several others, all of which are now shipping their ore by motor-truck to Tucson, a distance of 22 miles.

The Hecla-Arizona has expended \$40,000 in equipment and machinery and there is reason to believe additional money will be forthcoming to carry out the proposed work. The Hecla-Arizona adjoins the San Xavier Extension and is on the same vein in which a strike of good ore was made recently by the San Xavier Extension.

Tucson, August 6.

(Special Correspondence.)—William R. Ramsdell has resigned as president of the Arizona Cornelia Copper Co. The property adjoins the New Cornelia and consists of a number of claims still in the prospect stage.

Tucson, August 14.

(Special Correspondence.)—A big gold strike is reported by the Arizona Consolidated Copper & Mining Co., in the Greater-ville district. Maurice J. Fink is in charge. The Arizona Consolidated Copper & Mining Co. is affiliated with the General Mining Co. of Nevada, of which H. G. Humphreys is president. The strike was made on the J. B. Anderson property. C. H. James will examine and report on the property.

The Total Wreck mine, near Pantano, is being operated by E. L. Vail & Co. The Arizona Lead & Silver Co. is operating under the management of Selzig and Shanks. The Sesame Copper Co., operated by Charles Taylor, is cross-cutting on the 100-ft. level.

Tucson, August 16.

### PINAL COUNTY

(Special Correspondence.)—Two new mills are under construction at the Mammoth mine, for treating tailing that had been formerly worked. The mine is also being operated.

Tucson, August 16.

### YAVAPAI COUNTY

(Special Correspondence.)—The 10,000-ft. adit planned by the United Verde Extension, to connect with the 1400-ft. level of the mine, has been changed. The adit as now planned will be 12,500 ft. long and has been contracted for by the Porter Construction Co. of New York and St. Louis. Completion within a year at a cost of over \$1,000,000 is proposed. Tunneling has been commenced as well as the sinking of a 500-ft. shaft on the adit line which will give additional working faces. The adit will connect with a five-mile railroad from the United Verde Extension smelter. The construction of the railroad will be commenced at once. At pres-

ent the United Verde Extension is hoisting and shipping its ore to the smelters at Douglas, Globe, and Humboldt. As soon as the 4-mile railroad from Clarkdale to the smelter site is completed, the erection of the steel work of the 800-ton smelter will commence. Since the labor troubles the shipment from the United Verde Extension mine has averaged 230 tons per day of 25% copper ore.

The flow of water in the Jerome Daisy shaft has proved to be greater than anticipated and cannot be handled by the compressed-air equipment now installed. Arrangements are being made for the installation of electric power to handle the increase. A cross-cut has been started at the 250-ft. level to tap the orebody at a distance of 125 ft. Another block of 50,000 shares has been placed on the market at 60 cents.

The Copper Chief of the Hayden Development Co. is operating with 20 men instead of 40, since the labor trouble in May. Preparations are being made to overhaul the mill and rearrange the milling so as to increase the recovery. Before the strike the mill was treating 130 tons of gold ore per day. The presence of copper lowered the gold recovery.

The Consolidated Arizona Smelting Co. has declared its first 2% dividend. The accumulation of a larger working-capital has delayed the declaration of this dividend. The company has produced approximately 9,730,000 pounds of copper in the first half of 1917. The operating profit was at the rate of 5c. per pound, the gross profit figuring at 65c. per share per annum on the 1,663,000 shares.

Prescott, August 6.

(Special Correspondence).—It is reported that an examination has been completed by an engineer of the Standard Oil, and that he has recommended development in the China Valley district. Several companies are now in the field. It is expected that the Arizona Queen company will start drilling here by September 15. The Arizona Oil Syndicate controls the largest area in the China Valley field, recently having acquired 4000 acres completely surrounding the holdings of the China Valley Oil Co. The China Valley Oil Co. has sunk its first well to a depth of 2000 ft. and is preparing to start a second.

Prescott, August 9.

(Special Correspondence).—The Verde Combination shaft has now reached copper-bearing schist at 545 ft. There is a band of schist 27 ft. wide at 500 ft., which assays 2% copper. The showing in the bottom of the shaft is encouraging.—The cutting of the 600-ft. station at the Calumet & Jerome is finished and cross-cutting toward the orebody has commenced.—The Jerome Copper Co., which holds the Hooker and Ewing group of claims, a mile south of Jerome, is now financed. Negotiations are under way with the Arizona Power Co. for power. A contract has been let for the building of a 6000-ft. road, which when complete will enable the company to bring in its equipment of compressor, drills, steel, and the like. This machinery was bought from a company south of Prescott and is practically new. The development as now outlined will involve driving an 800-ft. adit to intersect the ore at a depth of 450 feet.

Prescott, August 16.

#### YUMA COUNTY

(Special Correspondence).—The Black Reef Copper Co. has been financed by Toronto and Niagara Falls capitalists. It controls a property in the Cunningham Pass district of the Harcuvor mountains. The mine is an old partly developed prospect; the main shaft is 325 ft. deep. The shifts have been increased and development is now being pushed.

Yuma, August 14.

#### CALIFORNIA

Conditions causing the small number of new wells started in the oil-fields in the past two weeks as shown by State

Mining Bureau reports, have evidently been altered, as the report this week shows 18 new wells, which is approximately the average shown during this year, and brings the total for the year up to 696. The Midway Sunset fields, as usual, show the major portion of this new development, the number of wells there being 13. The Santa Maria fields show an unusually high number, as 4 wells are being started, 3 of them being by the Union Oil Co. In the fields near Los Angeles only one new well is reported, belonging to the Standard Oil Co., and located in the new Montebello field, which has been developed this year.

There were 21 wells reported as ready for test of water shut-off, 17 deepening or re-drilling, and 4 abandoned, which is about the usual number.

In order to facilitate the securing of labor for fire-fighting on the National Forests, labor agents have been appointed by the Forest Service in Chico, Oroville, Marysville, Sacramento, Fresno, and Bakersfield. These agents are authorized to hire, transport, and provide food for fire-fighters at the request of Forest officers.

The total receipts from all sources on the National Forests in California for the fiscal year 1917 was \$436,032.05. In addition to \$109,000 turned over to the State, 10%, or more than \$43,000, was expended in road and trail construction.

#### AMADOR COUNTY

(Special Correspondence).—Operations are in satisfactory progress at the property of the South Keystone Con. Mining Co., between Sutter Creek and Amador City. Development work is under way at the 1000-ft. North Star shaft. A short cross-cut to the east at the 600-ft. level encountered a good-looking vein, 10 ft. wide. Raising and two cross-cuts have proved a width of about 200 ft. A chute has been cut at the 800-ft. level, preparatory to cross-cutting for this vein at that level, and, if conditions warrant, a cross-cut will later be run from the 1000 or lowest level, with the same object. A cross-cut has also been started to the west to cut the veins in the McIntire claim.

The north drift, which was started 300 ft. west of the shaft from the cross-cut, now has a length of nearly 800 ft. and is between 300 and 400 ft. north of the South Keystone's south end-line. Marked improvement is also in evidence in this drift, which in another month's time should reach a point opposite the South Spring Hill mill-site, where there is good reason to expect a rich vein of ore. It is estimated that three months' time will be required to reach the high-grade rock existing at the north end of the South Keystone. At a point in the north drift about 350 ft. north of the South Keystone's south end-line, a cross-cut was started east to encounter the vein that passes through the road about 200 ft. south of the old mill-site, and indications are favorable for the finding of a valuable orebody there.

The property is being opened by Tacoma capitalists, who are sparing no pains to make a success of the enterprise. John A. McIntire, of Sacramento, was formerly the owner of a large portion of this ground and retains an interest in the company.

Sutter Creek, August 19.

#### SHASTA COUNTY

(Special Correspondence).—The Mammoth Copper Co. of Kennett has taken a long term bond on the Delta Consolidated Gold Mining Co.'s patented claims on Dog creek five miles west of Delta. The bond is for \$150,000, and a substantial payment is to be made in six months. A narrow-gauge railroad connects the mines with the Southern Pacific at Delta. The Mammoth owns the McCourt group of copper mines adjoining the Delta group of gold mines and has been working thirty men on them for a year and shipping the ore to the smelter at Kennett. The smelter needs the gold quartz for flux and

can treat the ore for gold more cheaply than is possible by stamp-mill or other process. The Delta mines have produced high assays in gold, but the company has had trouble to secure advantageous treatment. Arkansas capital is largely interested.

At the Old Texas mine in Old Diggings the working-force has been increased from 6 to 35 men.

The Shasta Hills Mining Co. has erected a 5-stamp mill and concentrator on its mines five miles west of French Gulch. The principal mines are the Accident and the Sybil. The management is well pleased with the results of development. J. R. Davis is superintendent and part owner.

At the Little Nellie mine, between Keswick and Iron Mountain, the Pittsburg Mining Co. is working two diamond-drills to test the ledge at a considerable depth below the working tunnel. One hole has been driven 800 ft. to a depth of 1800 ft. below the apex.

William T. Morgan, of Denver, operating the Minnesota mine between Keswick and Iron Mountain, has closed a deal for a bond on the Sharp copper claims near Buckeye. Morgan will start development of the four claims about the first of September.

The Mountain Copper Co. is shipping an average of ten 50-ton carloads of ore per day from the Iron Mountain mine to its smelter and the Standard Oil Co. at Martinez. The output would be greater but for the shortage of miners.

Redding, August 19.

#### SISKIYOU COUNTY

(Special Correspondence.)—Ten years ago the Big Bullfrog Gold Bar mine in the Yreka district was closed down after a disappointing run of the new mill and has since been idle; \$150,000 had been spent in underground development, but no recovery process at the time would treat the ore. Changed conditions now make it possible to operate. It is fully equipped and in good condition. The re-organization committee, of which F. H. Oliphant, of Los Angeles, is secretary, is giving the former stockholders an opportunity to recover their interest in the form of new stock in a re-organized company on payment of two cents per share exchange bonus, payments to be made through the Continental National Bank of Los Angeles.

D. D. Good and D. M. Watt of Ashland, Oregon, report a new strike at their High Grade mine located on the south slope of the Siskiyou in the Stirling district. They were opening up the second ore-shoot in the new 240-ft. drift and working in 2 ft. of rich ore.

Chrome mining is quite active in the Etna district, and ore is being shipped to Eastern points.

Hornbrook, August 20.

#### TRINITY COUNTY

The Federal Chrome Co.'s mines near Peanut are now producing chrome that keeps three auto-trucks busy hauling to Redding. The distance is 73 miles. A round-trip is made in three days. S. B. Hall is superintendent. It costs \$20 per ton to haul the chrome to Redding, but it brings \$60 per ton in Pittsburgh, to which point all of it is shipped.

#### IDAHO

The Idaho-Hecla Mining Co. on August 20 declared dividend No. 171, of 15c. per share, amounting to \$150,000. The total dividends for 1917 amount to \$1,200,000, making a grand total to date of \$6,505,000.

#### MONTANA

##### LEWIS AND CLARK COUNTY

(Special Correspondence.)—The mining outlook is favorable. At Marysville the mill at the Shannon and Piegan-Gloster is in constant operation. Ore in the Shannon mine at

the 500-ft. level assays above \$75 per ton for a distance of 150 ft. in length. About \$40,000 is due on the payments for the Shannon and is expected to be paid within two months. The properties are all owned by the Barnes-King Development Co. C. W. Goodale, president of the company, whose headquarters are in Butte, visited the mines at Marysville last week.

The St. Louis Mining Co. is milling about 80 tons of gold ore every 24 hours. The results are satisfactory to those in charge. The company owns all of the ground held by it originally, and in addition has acquired through the courts all of the holdings of the Drumlummon (Ltd.). Ores treated in the mill by cyanide are taken from old stopes in what was formerly Drumlummon ground.

Immediately surrounding Helena most of the mining work consists of development, although some ore is being shipped. The Scratch Gravel Gold Co. sends to the smelter two cars per week. The ore nets over \$3000 per car. The Thomas Cruse Development Co. is having an exhaustive examination of its property with a view to determining the best plan to pursue in future work.

The Helena Mining Bureau has installed a new boiler and is taking ore for shipment from the Helena mine. The ore comes from the 300-ft. level and averages about \$35 per ton in silver and lead.

Work on the Rock Rose and Looby ground, which are controlled by the Cruse Con. Co., consists mostly of development. Ore is coming from both the Rock Rose and Looby shaft.

Helena, August 20.

#### SILVERBOW COUNTY

The strike of the smelter-men at the Washoe smelter at Anaconda has caused the Anaconda Copper Co. to close down its mining and reduction properties. The smelters at Anaconda and Great Falls, together with the mines at Butte, employ 15,000 men.

#### NEVADA

##### NYE COUNTY

(Special Correspondence.)—The Tonopah Belmont last week produced 2616 tons of ore. The intermediate drift, above the 700-ft. level on the South vein, intersected a fault, but the vein was picked up again, and it shows good assays. The east of the 800-ft. level on the Rhyolite vein has a 3-ft. face of good ore. The west drift of the 1166-ft. level on the Mizpah Fault vein has been discontinued.

The Tonopah Extension the past week sent 2380 tons of ore to the mill. Development in the No. 2 shaft was 57 ft., and 70 ft. was made in the Victor. The east drift of the Victor on the 1440-ft. level has intersected a large body of fair ore.

The Tonopah Mining Co. has discontinued development in the Mizpah Extension, which it had operated for the past three years. The 35 ft. of development at the Sandgrass was confined to the winze, which is going down on the foot-wall of the vein. Development at the Silver Top consisted of 113 ft. The ore production the past week was 2050 tons.

The net earnings of the Jim Butler Mining Co. for July were \$53,564, from 3112 tons of ore. The ore production the past week was 700 tons.

The development of the West End is centred on raise 522 of the Ohio, which is being run for air connections. The West End produced 959 tons of ore the past week, while the Halifax sent 51 tons to the mill.

The production of the Rescue-Eula the past week was 123 tons, the North Star 55 tons, and the Cash Boy 105 tons. Lessees at the Montana produced 55 tons, making the week's output at Tonopah 8999 tons, with gross value of \$162,000.

Tonopah, August 20.

(Special Correspondence.)—The Louisiana Consolidated Mining Co. is shipping steadily from the Tybo mine, 68 miles north-east of Tonopah, ore that averages \$75 per ton, assays

showing 20% lead, 50 oz. silver, and \$4 gold. From a single opening the company is outputting 20 tons per day, the ore going by auto-truck to Tonopah and thence to the smelters. Five trucks and trailers are already in use and five more are to be added. The ore is coming from the foot-wall vein, which has heretofore been little explored, the previous production of \$5,000,000 having come almost entirely from the hanging-wall vein. The foot-wall vein was found by cross-cutting the andesite at the 400-ft. level, 4 ft. of ore at this point averaging \$117 per ton. In a raise from the 300 to the 400-ft. level the orebody had an average width of 4 ft. the entire distance. On the 300-ft. level the orebody has widened to 8 feet.

Arrangements have been completed for extending the electric power-line of the Nevada-California Power Co. from Belmont to Tybo, and a mill will be built to concentrate the low-grade ore and make a separation of the lead and zinc. The mill will be erected on the site of the old stamp-mill. The Louisiana company has acquired the property of the Tybo Lead company, which was the west extension of the Tybo. A new shaft will be sunk. Sinking of the main Tybo shaft from the 400 to the 800-ft. level will also begin during the month. The Louisiana company has purchased the Pearl and Zenda mines in Kern county, California, and will start operations there this month. The property is a large low-grade silver-gold deposit, which is worked on the open-cut system. The company estimated that there is 300,000 tons of \$5.50 ore in sight and that it can be mined and milled at a total cost of \$3 per ton. The present mill will be enlarged to treat 100 tons per day. Later it will be enlarged to treat 250 tons per day.

#### WHITE PINE COUNTY

An eight-hour day is to be put into effect in the open pits of the Nevada Con. M. Co. A settlement of an impending labor difficulty is avoided by the change.

The Ely School of Mines, a local school for miners, will open September 4.

#### NEW MEXICO

##### GRANT COUNTY

(Special Correspondence.)—The Pinos Altos mining district came into existence through the discovery of rich placer gold in the gulches and it was but a short time until a camp sprung up. Placer mining continued profitable for 20 years. Later miners and prospectors began looking for the source of the gold. Lode mining claims were filed on and developed, but the ore proved to be complex-lead, copper, and zinc, with some silver and gold. After several years of operation the old companies suspended work and the camp became quiet. As time went on prices and demand for copper, lead, and zinc began to increase and men of small capital endeavored to mine the Pinos Altos ores; but experience of the past few years has proved that while the district abounds with pay-ore it needs capital which, judiciously expended, will be amply repaid in exploiting these ores. This complex ore is susceptible to separation processes, either by the Huff electro-static, the magnetic separators, or the flotation process, the last being preferable, having given evidence of a greater recovery, as proved by the successful operation of the Cleveland mine and mill of the Empire Zinc Co. The ore is heavy with zinc—a complex ore, treated by the magnetic separators and the flotation process.

Other companies are operating on a small scale, but there is not the activity in the Pinos Altos district that the district justifies. Companies with plenty of capital for initial work and exploiting at depth is what is needed. The small companies now operating are doing a great work in furthering development, but it is a case of opening a vein of ore as soon as possible, suspending development while they get out a few carloads to help pay expenses.

The companies operating in the district besides the Empire Zinc Co. and that are doing good work on small capital are the

El Paso Mining & Milling Co., Doyle and Clark, of the Manhattan group, the Calumet & New Mexico Mining Co., and the United States Copper Co. The last began operations on what is known as the Hardscrabble group in January of this year, but suspended operations the middle of May. It is expected they will resume development in August or September. The Calumet & New Mexico Mining Co. has blocked out sufficient ore to warrant a concentrating-plant this coming winter. They ship the high-grade lead and zinc ore to Coffeyville, Kansas. Doyle and Clark, of the Manhattan, are mining and shipping from their Indian Hill shaft and have a crew sinking a shaft at the end of the Manhattan adit in 900 ft., the shaft to be sunk 500 ft. A good tonnage of low-grade ore is developed. The El Paso Mining Co. is mining in the Pacific No. 2 shaft on the Skilacorn vein and occasionally encountering rich gold ore but developing the low-grade, which will be treated in their own concentrator. The Huff electro-static separators and the flotation process are used in this mill.

The Hardscrabble group, covering a dike 1000 ft. wide and over 6000 ft. long, of grano-diorite, and the ore is not complex, no zinc being found. The low-grade ore is ideal for concentrating and the high-grade acceptable to the smelters for its self-fluxing qualities. All ores are hauled to Silver City for shipment by rail, from 8 to 10 miles.

Pinos Altos, August 6.

(Special Correspondence.)—The sinking of the 4 by 7 ft. winze at the end of the 900-ft. adit on the Manhattan property has reached a depth of 350 ft. A station will be cut and driving on the ore will begin this week. Considerable stoping-ground will be opened. The adit cut a good vein of heavy iron sulphide carrying copper, gold, and silver, when in between 450 and 500 ft. The shaft is sunk 8 ft. to the west of the vein which first had a slight dip to the east, later straightened, and now is dipping toward the shaft. The ore is of shipping grade, running between \$40 and \$50; 150 ft. of stoping-ground has been opened on the 4th level, where mining and shipping will begin this week. The company expects to ship 25 tons or more daily to the Copper Queen smelter at Douglas. The nine-mile haul to the railroad at Silver City costs \$2.50 per ton, and the transportation rate to Douglas is \$1.75 per ton. Thirty men are employed and the prospects are bright for the fall and winter. Jackhammer drills are used in sinking and driving, and one Ingersoll and one Waugh stoper are being tried out. An Ingersoll-Rand compressor, driven by a 24-hp. Muncie oil-engine furnishes the power. A Fairbanks-Morse hoist, capable of sinking to 500 ft., with a  $\frac{5}{8}$ -in. cable and a 1000-lb. bucket, was installed some time ago and is being operated successfully. The new ore being found in this shaft demonstrates that its value is increasing with depth. The vein averages about 3 ft. in width. Independent of this high-grade ore considerable low-grade milling ore is also being opened up. A custom-mill is much needed in this district. The Indian Hill shaft of the Manhattan group is shipping regularly. R. L. Doyle, of Cripple Creek, is in charge of all work at the Manhattan, and M. S. Clark is in charge of the office.

One shift is driving on ore at the Langston property.—The El Paso Mining Co.'s mill has not yet resumed operations, but is expected to soon. Shipment of high-grade ore is being made.—The Empire Zinc Co.'s ore is increasing in copper content in the lower workings.—J. W. McAlpine, president of the United States Copper Co., arrived at Pinos Altos this week, and will remain until September 1. It is reported that development of the company's Hardscrabble group will begin about August 15.

Pinos Altos, August 6.

(Special Correspondence.)—Six miles south of Lordsburg a rich silver-lead strike has been made on the Brown-Wiggins-Weldon group, which is being worked by Weldon and Cole. From the bottom of two 100-ft. shafts ore is being taken out that averages \$10 in gold, \$6 in silver, and 65% lead. This

property adjoins the Lister property on the east and is believed to be an extension of the latter. Weldon and Cole are shipping about two tons of high-grade lead ore per day to the smelter at Point Richmond, California.

The El Dorado group of copper properties in the vicinity of Lordsburg was sold by Messrs. Killebrun and Fairly, the owners, to James P. Porters of Lordsburg, who is understood to be associated with prominent mining men. All of the ground between the Bonney mine and the Eight-five mine is under the control of Porters. B. L. Cunningham, assistant geologist of the Southern Pacific railroad, and Mr. Porters have recently made a complete examination of the district.

Lordsburg, August 6.

(Special Correspondence.)—Development work at the mine of the Austin-Amazon Copper Co., in the Burro mountains, totals 2500 ft. of shafts, adits, and cross-cuts. A great part of this work is in payable shipping and milling ore. A cross-cut has been driven through the mineral-zone from the first level which shows an orebody 80 ft. wide, 30 ft. of which averages better than 4% copper. This orebody will be cross-cut at the 200-ft. level. The company expects to make new shipping contracts. Negotiations now pending may result in the erection of reduction works and other improvements by the company. The Janney flotation machines are to be given a practical test here. This machine is especially adapted to the complex ores of the Hanover district. The Republic Mining & Milling Co., of which Mr. Janney is president, will build a 100-ton mill on the company's property at Hanover, which will include the Janney machines. The principal value of the ores in this district is in copper and zinc sulphide. The successful operation of the new mill and the new process will result in a revolution in the milling methods in this district and also in the Pinos Altos district, where the same class of ore predominates.

Hanover, August 14.

## SOUTH DAKOTA

### LAWRENCE COUNTY

(Special Correspondence.)—The Capital Gold Mining & Milling Co., on Deadwood gulch, one and a half miles west of the Homestake mine and adjoining the Trojan mine in Bald Mountain district, is preparing for active operations on the property, a compressor with 20-hp. McVitters gas engine, with 650 ft. of air pipe-line has been installed, and work will be started at once to complete the adit on the south side of the Deadwood creek to get under the shaft in which assays indicate ore worth \$24.80 per ton gold. A part of this ore will be shipped to the Trojan mill, until the company has completed the transfer of the machinery of a large concentration plant at Central City, which will be converted into an up-to-date cyanide plant with 350 tons capacity. The company has a vein 110 ft. wide, exposed in the railroad-cut of the C. & N. W. railroad, which shows assays of \$3 to \$12 per ton. This vein can be traced across the property, which consists of 60 acres. It lies in the centre of the heaviest ore-producing area of the silicious belt. The company has been re-organized under the laws of South Dakota with a capital stock of \$1,500,000, the most of which is held by Omaha, Nebraska, business men. R. M. Harrop, a graduate of the South Dakota School of Mines, is secretary and general manager for the company.

Deadwood, August 1.

## KOREA

The Seoul Mining Co., operating the Suan Concession in Whang Hai province, reports results for the month of July, 1917: Total recovery, \$99,835.

The Holkol mine has been running continuously for several years and was in need of a general overhauling. This caused a shut-down for a considerable part of the month and the results were reduced thereby.

## Personal

*Note: The Editor invites members of the profession to send particulars of their work and appointments. This information is interesting to our readers.*

W. DEL. BENEDICT is here from New York.

RUSSELL C. MCGINNIS has obtained a commission in the Army.

WALTER H. WILEY was here last week and is now at Tucson, Arizona.

THOMAS KIDDIE has returned to Los Angeles from British Columbia.

ELBERT H. GARY and D. C. JACKLING have returned to Seattle from Alaska.

R. A. F. PENROSE has been in San Francisco, engaged in patriotic work.

JAMES L. HEAD is in the Engineer Officers' Training Corps at Fort Leavenworth.

H. VINCENT WALLACE has returned to Los Angeles from Guanajuato, Mexico.

F. S. NOBXCROSS is superintendent of the Copper Mountain mines, near Princeton, B. C.

HERBERT C. HOOVER has been elected an honorary member of the American Institute of Mining Engineers.

WILTON J. CROOK, of Stanford University, is in the Officers Training camp at the Presidio, San Francisco.

B. W. KNOWLES has been appointed superintendent of the Nickel Plate mine, at Hedley, B. C., in succession to W. SAMPSON.

F. C. LINCOLN, director of the Mackay School of Mines, Reno, Nevada, has been appointed State Assayer and Inspector for the State of Nevada.

JOHN F. BERTELING, Michigan representative of the Sullivan Machinery Co., has taken a position as superintendent for the Newport Mining Company.

F. C. FRENCH is manager for the Consolidated Mining & Milling Co., of Salt Lake City, and is now in charge of the Golden Fleece mine at Lake City, Colorado.

S. R. BROWN has resigned as mill superintendent for the Plymouth Consolidated to accept a position with the Porphyry Dyke Gold Mining Co. at Rimini, Montana.

FRANCIS A. THOMPSON has resigned as dean of the Washington State School of Mines at Pullman in order to accept a similar position at the University of Idaho, at Moscow.

C. B. DUNSTER of the Mining Department of Breitung & Co., New York, has succeeded H. L. KAUFMAN as manager of E. N. Breitung & Co., at Cleveland, and as assistant general manager of the Breitung iron properties.

ERLE P. DUDLEY, construction engineer at the Bunker Hill & Sullivan concentrators, at Kellogg, Idaho, has received his commission of the grade of captain, Engineer Officers Reserve Corps, from the Adjutant General, United States Army.

Judge C. C. GOODWIN, Nevada pioneer, well-known editor and author died on August 25 at his home at Salt Lake City. Goodwin was editor of the 'Territorial Enterprise' of Virginia City, Nevada, during the period preceding the early 'eighties. Mark Twain, Bret Harte, Dan De Quille (William Wright), Joseph T. Goodman, and others who later gained fame, were associated with Goodwin. He was the author of 'The Comstock Club', 'The Wedge of Gold', and other Western books. As editor of the Salt Lake 'Tribune' he exercised a wide and useful influence.

# THE METAL MARKET

## METAL PRICES

San Francisco, August 28

Aluminum-dust (100-lb. lots), per lb.	\$1.00
Aluminum-dust (ton lots), per lb.	\$0.95
Antimony, cents per pound.	15.50-17.00
Electrolytic copper, cents per pound.	28.50
Pig lead, cents per pound.	12.25-12.50
Platinum, soft and hard metal, respectively, per ounce.	\$105-111
Quicksilver, per flask of 75 lb.	\$115
Spelter, cents per pound.	10
Tin, cents per pound.	60
Zinc-dust, cents per pound.	18

## ORE PRICES

San Francisco, August 28

Antimony, 45% metal, per unit.	\$1.20
Chrome, 40% and over, free SiO <sub>2</sub> limit 8%, f.o.b. California per unit.	\$0.55-0.70
Magnesian, crude, per ton.	\$8.00-10.00
Tungsten, 60% WO <sub>3</sub> , per unit.	\$25.00-28.00
Molybdenite, per unit for MoS <sub>2</sub> contained.	\$40.00-45.00
Manganese, Carnegie schedule less freight to Chicago. Less than 40% special quotation.	

Manganese prices and specifications, as per the quotations of the Carnegie Steel Co. schedule of prices per ton of 2240 lb. for domestic manganese ore delivered, freight prepaid, at Pittsburgh, Pa., or Chicago, Ill. For ore containing

Above 49% metallic manganese.	\$1.00
49 to 49% metallic manganese.	0.98
43 to 46% metallic manganese.	0.95
40 to 43% metallic manganese.	0.90

Prices are based on ore containing not more than 8% silica nor more than 0.2% phosphorus, and are subject to deductions as follows: (1) for each 1% in excess of 8% silica, a deduction of 15c. per ton, fractions in proportion; (2) for each 0.02% in excess of 0.2% phosphorus, a deduction of 2c. per unit of manganese per ton, fractions in proportion; (3) ore containing less than 40% manganese, or more than 12% silica, or 0.225% phosphorus, subject to acceptance or refusal at buyer's option; settlements based on analysis of sample dried at 212° F., the percentage of moisture in the sample as taken to be deducted from the weight. Prices are subject to change without notice unless specially agreed upon.

## EASTERN METAL MARKET

(By wire from New York)

August 28.—Copper is easier, being nominal at 26.50 to 26.25c. Lead market is quiet, prices a little lower for the week at 10.67 to 10.50c. Zinc is dull and weaker at 8.50 to 8.25c. Platinum remains unchanged at \$105 for soft metal and \$111 for hard.

Combined production of the four Jackling porphyry copper mines for the first half of 1917 was 223,015,885 lb., larger than ever before in a like period. All of the mines aided in establishing this record with the single exception of Nevada Consolidated, whose half year's total of 36,689,677 lb. was exceeded last year when over 43,000,000 lb. was turned out.

Utah Copper was responsible for the greater part of the gain, although in pounds of new copper produced it was not far ahead of the increase scored by Ray Consolidated. Chino showed a moderate advance over last year.

Production figures in detail for the first six months of the past two years compare (pounds):

	1917	1916
Utah .....	99,289,787	84,049,462
Nevada Consolidated .....	36,689,677	43,347,854
Ray Consolidated .....	47,284,523	35,581,340
Chino .....	39,771,704	34,366,632
Total .....	223,015,885	198,245,294

Assuming a 28c. average price received for copper, these companies did a gross copper business of \$62,444,491 in the first half of the year, of which perhaps \$35,000,000 was saved for net.

None of these companies has been affected by the labor difficulties that have visited practically every other camp in the country.

## LEAD

Lead is quoted in cents per pound, New York delivery.

A mid-year canvass of lead production by the U. S. Geological Survey, the results of which have been collated by C. E. Siebenthal, shows that the output of domestic de-silvered lead, excluding de-silvered soft lead for the first six months of 1917, was 152,231 short tons, compared with 153,535 in the same period of 1916. Domestic soft lead, including the de-silvered, was 124,292 tons against 117,879 last year, and the lead produced from foreign ores and bullion was 29,539 tons while the amount for the half year in 1916 was only 9453. In view of the scarcity of the metal the increase in lead of foreign origin is encouraging. The greater part came from Mexico. According to the records of the Bureau of Domestic and Foreign Commerce, the total lead imported during the first six months of 1917 was 30,620 tons, of which 22,507 tons came from Mexico and 4569 from Canada. The exports of domestic lead amounted to 29,241 tons and of foreign lead 6066 tons. The lead used in articles exported with the benefit of drawback was 3270 tons. Thus the total exportation of lead amounted to 38,577, and the apparent consumption in this country in the six months was 268,952 tons, being an increase of 38,365 over the same period in 1916. The production of new antimonial lead was 7822 tons, and of secondary antimonial lead 1969 tons, being a marked decrease. The average outside spot price of lead during the six months was 9.9c. per pound, as against 6.9c. in 1916.

## Eastern Metal Market

New York, August 22.

While prices are lower than a week ago, business is not stimulated thereby, and all of the markets will undoubtedly remain dull and stagnant, pending an announcement by the Government of its decision in the matter of price-fixing. It is almost certain that the situation cannot be allowed to drift much longer. A preliminary report on the cost of producing steel and copper has been completed by the Federal Trade Commission and will be transmitted to the President within a day or two. It is expected that he will devote several days study to the report before taking action, and until then no information regarding the findings of the commission will be made public.

Copper is dull and prices are nominal.

Tin is lifeless and quotations are slightly lower.

Lead is stagnant and prices have declined slightly.

Zinc prices are unchanged, although there are indications of weakening.

Antimony is lifeless with no sales reported.

Aluminum is quiet and prices are nominal and unchanged.

Although the steel trade is awaiting the decision of the Government as to the prices to be paid for ship and munition steel and expects that it will be made shortly, the outlook for the prices of steel for the Allies and the public is not clearer in any respect. The orders of the Government for wire rods and wire for Italy, mentioned last week, have been held up. While this had been accepted by the manufacturers at prices to be determined later, with the proviso that the Government actually should place the order and become responsible for the payment, it was found that no appropriation existed which could be drawn upon to buy steel for a foreign government. As in previous weeks the market has shown no significant changes in prices. Any softening of pig-iron prices is usually found in re-sale transactions. Cases are cropping up in which there was over-buying and not a little Southern iron was sold at concessions for this reason. Embargoed iron for export is also coming on the market and can only be moved at less than recent quotations.

### COPPER

Since the President has announced a fixed price for coal the trade realizes that a precedent has been established, in spite of the belief of many that he could not and would not arbitrarily fix prices to be paid for copper and other non-ferrous metals purchased by the Government. Fixed prices for steel, copper, and other materials are expected to be announced shortly, the trade apparently being reconciled to such a drastic policy. For this reason buyers and sellers continue to play a waiting game until the uncertainty as to Government prices is removed. The market has weakened slightly in consequence and the quotation today is about 1c. less than last week. Since hardly any metal is changing hands, and since that which is sold is without exception for actual nearby requirements, this quotation is purely nominal. Both Lake and electrolytic are quoted at 26.50c., New York. A cable from London on Monday showed no change from last week's quotations of £137 for spot electrolytic and £133 for futures.

### TIN

Some business in futures has been done, but delays in the receipt of the cables from London are retarding transactions considerably. This was particularly the case last Friday when the interest of consumers was aroused in the shipments to be made from the Straits Settlements late this year, but nothing was done owing to delays in cables. The market has been stagnant since then, although on both Saturday and Monday

a slight interest in futures developed, and some business was transacted. Some cheap offerings of tin about to be shipped from England were made last Thursday, but these were not taken. The arrivals of tin to August 20 were 2470 tons, and the quantity afloat on that day from both the Straits Settlements and ports in the United Kingdom was 4215 tons. The quotation yesterday was 61.75c., a decline of  $\frac{1}{2}$ c. from the price which has prevailed for the greater part of the week.

### LEAD

Domestic demand and business is almost nothing, and as a result the market continues quiet. Not much is known regarding the policy which the Government is likely to follow with respect to lead prices. The price paid for the lots purchased to meet the Government requirements of about 8000 tons per month is announced as 8c. per lb., St. Louis. Producers, it is understood, are not disposed to criticize this price, as the profit made at that figure is a fair one. More lead was offered in the week than could be absorbed, and quotations declined slightly as a result. The price is now 10.75c., New York, the leading interest still continuing to adhere to the 11c. quotation. A few days ago this price, 10.75c., was paid for a small tonnage for export which changed hands, and another good sized lot was sold at 10.50c., New York, in bond.

### ZINC

The transactions in zinc are not enough to make a market. Some indications of a slight weakening on the part of small handlers have appeared. As a result of this action, which is attributed either to a desire to stimulate activity, or to dispose of stocks that have been held for some time, prices have declined to 8.62c. in the last few days.

### ANTIMONY

There is virtually no market, and prices for Chinese and Japanese grades remain unchanged at 15 to 15.50c. per lb., New York, duty paid.

### ALUMINUM

Aluminum remains exceedingly dull. The quotation for No. 1 virgin metal, 98 to 99% pure, is unchanged at 50 to 52c. per lb., New York, this figure being a nominal one.

### ORES

Tungsten: Although the market has been firm in the past week the quotations remain unchanged at \$25 for high-grade wolframite. Inquiries for forward position continue on a large scale, and several hundred tons has changed hands. Ferro-tungsten is unchanged at from \$2.25 to \$2.50 per lb. of contained tungsten.

Molybdenum and antimony: Offers of \$2.10 to \$2.20 per lb. of MoS<sub>2</sub> in 90% material have been made for small quantities now in transit, and the market is practically bare of supplies. Very few offers of antimony ore have been made, as the high freight rates make shipments at the prevailing low prices almost out of the question. The quotation, which is practically nominal, is unchanged at \$2 per unit for high-grade material.

MANGANESE shipments from Bahia, in Brazil, have been resumed. The largest deposit is in the municipality of Bom Fim, and is reached via the Central Railway of Brazil. Two shiploads of the ore have recently left the port of Bahia for the United States, one cargo consisting of 4000 tons and another of 4300. Deposits near Nazareth, State of Bahia, have large amounts of manganese developed but lack of transportation facilities makes them unavailable.

# INDUSTRIAL PROGRESS

Information furnished by manufacturers

## The Process of Spellerizing as Applied to Pipe

The form and chemical composition of matter are well-known to be distinct properties. For example: Fig. 1 repre-

Fig. 1.

Fig. 2.

sents carbon in the form of coke; Fig. 2 represents the same material in the form of a diamond. The diamond is practically pure carbon, bearing no outward resemblance to carbon in the form of coke, coal, or charcoal. Metals undergo changes almost as remarkable if subjected while hot to certain heat treatment and mechanical manipulations.

Commercially pure iron is produced in several forms; pud-

insofar as pipe is considered, with which this article is particularly concerned, thorough investigation and research have shown that the greatest danger from corrosion occurs to the smaller sizes of pipe owing to the thinner walls. The larger sizes with thick walls are made from heavy plates of such uniform quality that corrosion does not seriously affect them to any appreciable extent. To overcome the tendency to corrosion in the smaller sizes a process has been evolved, known as 'spellerizing.'

Inasmuch as this process is entirely mechanical and does not in any way depend upon skilled labor, beyond keeping up the machinery involved, uniform treatment is assured.

The spellerizing process is applicable to the smaller sizes of pipe—say, 4 in. and under—although it is possible in special cases to spellerize pipe a few inches larger.

As a matter of fact, the process of spellerizing metal may be considered analogous to the kneading of dough from which bread is made. Dough is kneaded to produce a smooth uniform texture; to facilitate the escape of confined gases, which would form air-holes and other irregularities in substance and on the surface, and to make an even grain and fine smooth sur-

FIG. 4. SAMPLE OF WROUGHT-IRON PIPE IMMERSSED IN RUNNING MINE WATER IN WEST PENNSYLVANIA COAL MINE. COMPARATIVE LOSS BY CORROSION. WROUGHT IRON, 100%; SPELLERIZED STEEL PIPE, 73%. (See Fig. 5 below.)

FIG. 5. SAMPLE OF SPELLERIZED MILD STEEL PIPE IMMERSSED IN RUNNING MINE-WATER IN WEST PENNSYLVANIA COAL MINE, SIDE BY SIDE WITH FIG. 4. COMPARATIVE LOSS BY CORROSION. WROUGHT IRON, 100%; SPELLERIZED STEEL PIPE, 73%.

dled iron, knobbed charcoal-iron, so-called ingot-iron, and soft welding-steel have much the same chemical composition as commercial products, but may differ considerably in physical properties and durability according to the treatment given in the process of manufacture.

Uniformity, both as to chemical composition, density, and character of structure and finish, has been demonstrated to be the most important factor governing corrosion in pipe. The actual chemical composition of the iron or steel has been demonstrated to be of comparatively little importance provided it is not unduly variable in the same piece.

face. Much the same results are obtained by spellerizing steel.

In a general way, this illustrates the principle on which the spellerizing process is based, that is, the aim is to make the metal uniform, so that corrosion will be uniform, and not in the form of pitting, for pitting in pipe represents the presence of weak spots.

There are other factors, such as contact with other materials, which are electro-negative to iron, such as carbon or oxide of iron, or electrolysis due to stray currents which will cause local failures no matter how carefully the steel is made.

Pipe has been made by this process for ten years in increasing amounts. It is significant to note that official records of the American Iron and Steel Institute show that during this period steel-tubes and pipe have increased from 74.3% of the total production in 1906 to 87.9% in 1916.

A few special references to experiences in the use of this process and its influence on steel pipe is of practical interest:

(1) H. J. Macintire, professor of mechanical engineering, in Washington University, in an article in the issue of June 5, 1917, of *Power* (pages 760-761), says, relative to corrosion about the power-plant: "In the case of ordinary steel pipe, mill-scale is always present, and this likewise is electro-negative to the iron. If this scale is evenly distributed, as in spellerized steel, the self-corrosion on its account will be slight; but if it is segregated, then local electrolysis and pitting of the material will result."

(2) Morgan B. Smith, in the October 1913 issue of *Ice*, states with reference to the merits of the spellerizing process: "Steel pipe, which has been treated in such a manner as to eliminate, or at least distribute evenly the mill-scale, may be joined with wrought-iron or cast-iron safely, as a rule. . . . The same stock without the treatment for mill-scale will show a decided tendency to corrode when joined with wrought-iron or cast-iron. The so-called spellerized steel fulfills this condition with respect to the scale."

(3) R. B. Duncan, associated with the United Gas Improvement Co., of Philadelphia, in a paper, 'Installation and Maintenance of Service,' read before the ninth annual meeting of the American Gas Institute, 1914, states: "The steel industry has been developing a new process which, after several years, has given many encouraging results. By this process the steel is treated mechanically and does not in any way depend upon skilled labor, beyond keeping up the machinery involved, hence uniform treatment is assured. This new process is a method of treating metal which consists in subjecting the heated bloom to the action of rolls having regularly shaped projections on their working-surfaces, then subjecting the bloom, while still hot, to the action of smooth-faced rolls and repeating the action whereby the surface of the metal is worked so as to produce a uniform dense texture better adapted to resist corrosion, especially in the form of pitting."

(4) *The Gas Record* of September 23, 1914, page 222, in commenting on Mr. Duncan's paper in regard to the spellerizing process, says: "The consensus of opinion is that modern steel-pipe, particularly if spellerized, is as durable as wrought-iron, and is, besides, cheaper, stronger, and more ductile and more uniform in composition."

(5) Pipe-steel made in 1906 by this roll-knobbling process tested against pipe-steel made in 1897 resulted not only in a somewhat greater loss of weight by corrosion of the latter, but a decidedly deeper pitting of the 1897 steel in 6 months, than occurred in the 1906 steel in 13 months. In comparison with wrought-iron it was found that the two materials lost practically the same weight by corrosion, yet the steel had the advantage of uniform corrosion, since the wrought-iron skelp pitted in 7 months much deeper than the steel did in 13 months. (Prof. H. M. Howe, Am. So. for Testing Materials, 1908.)

(6) New spellerized steel-pipe and new wrought-iron pipe, considered best by the master mechanic of a large western Pennsylvania coal mine, were submerged in running mine water side by side, but insulated from each other. Fig. 4 and 5 show the uniform corrosion of specially worked pipe-steel as compared with irregular corrosion and pitting of wrought-iron pipe.

(7) A. Sang, in a résumé of the question, entitled 'The Corrosion of Iron and Steel' (McGraw-Hill Book Co., New York, 1910), says: "The carefully acquired experience of the largest manufacturers of tubes in the world, which induced them recently to abandon the manufacture of wrought-iron pipe,

teaches that the use of steel in place of iron, at least in the United States, for the special purpose of tubing is to be preferred; the tendency of steel to pit is somewhat less than that of iron and it welds at the joint fully as well."

(8) "There is little, if any, difference between the corrosion on the wrought-iron and the corrosion on the steel-pipe. If anything, the wrought-iron is pitted a little deeper, that is, the pitting on the steel pipe is probably more general all over the surface, but the pitting on the wrought-iron pipe is deeper in spots that are affected." (Proc. American Gas Institute, Vol. III, 1908, page 274.)

(9) "While the corrosion was about the same, there was a pitting in the iron that we did not find in the steel, and the steel was corroded more uniformly. From the tests made, I know that the steel pipe is better for such conditions." (Superintendent of one of the largest bituminous coal operations in the Pittsburgh district.)

The evidence might be continued ad infinitum; but it is believed sufficient has been mentioned to show that the tendency of the spellerizing process is to render the surface of pipe uniform and reduce the tendency to corrosion, especially in the form of pitting.

### 'Smelting-Furnaces and Accessory Equipment'

The above is the title of Bulletin 1417-A of the Allis-Chalmers Manufacturing Co. of Milwaukee. The bulletin contains 48 handsomely illustrated pages, which display and describe blast-furnaces ranging in size from the small water-jacketed cupola, suitable for out of the way places, to the large welded water-jackets, 48 by 192 in., for copper smelters of large capacity. Lead furnaces also are shown, as well as reverberatories, movable forehearths, settling-pots, blowers, and all the usual accessories of the modern smelter. Those interested in this sort of metallurgical equipment may procure a copy of this interesting bulletin by addressing the Allis-Chalmers company in the prominent cities of the United States, and also in foreign countries.

### Roller-Chain Drives

The Link-Belt Company has issued two neat little books descriptive of the Link-Belt roller-chain drive, which finds many uses in driving machinery, and particularly in driving motor cars of every description and size. On the Mexican border, after many experiments with numerous varieties of trucks the United States government gave preference to chain-driven trucks. It is also said that in Germany, chain-driven trucks are displacing other types of machines driven by shafts and internal gears. These publications give much useful data on the power required, the load per tooth of the sprocket-wheels, and durability and cost of operation of chain-drives on cars. These booklets will be sent to those interested, upon application to the Link-Belt Co., which has offices in all of the principal cities of the country. The main office is at 39th street and Stewart avenue, Chicago.

### A Twenty-Eight Story Hotel

The General Electric Co. is to play an important part in the building of the world's greatest hotel, the Commonwealth, soon to rise 28 stories in the Times Square district of New York, under the supervision of Charles E. Knox. The electrical equipment for power will be sufficient for a city of 20,000 inhabitants.

Not only the electrical apparatus for the lighting, heating, and ventilating of the great building, but the electrical devices for operating and controlling the machinery used in the kitchen, laundry, and refrigeration departments, the pneu-

matic-tube service, vacuum-cleaner system, and the various pumps necessary in a building of the Commonwealth type will be furnished by the General Electric Co. This company also will furnish the electrical conduits, wires, cables, and incandescent lamps for this greatest of hostelieries.

The Hotel Commonwealth will occupy an entire block-front in the heart of New York's shopping and amusement centre. It is to contain 2500 rooms, costing from \$1.50 per day (with bath) upward. To be designed, built, decorated, and equipped under a single contract originated by W. J. Hoggson. It will cost a total of \$15,000,000 and will be owned and operated on a co-operative basis by over 100,000 shareholders, each of whom may subscribe for from one to ten shares of stock at a par value of \$100. No one person will be allowed to subscribe for more than ten shares, and with so great an army of shareholders, it is expected that the Commonwealth will have capacity patronage the moment its doors are opened for business.

Dividends, rebates upon expenditures for food and lodging, discounts through the shopping bureau on purchases at New York stores, and the splendid club privileges of the Commonwealth, are some of the advantages to shareholders.

H. L. Merry, one of the most widely known hotel managers in the country, will manage the Commonwealth. C. M. Ingersoll, the watch manufacturer, is president of the corporation. The enterprise is backed by about 50 firms of national importance. The *New York Globe*, after a thorough investigation of the project, pronounced it the greatest co-operative movement ever undertaken in America and heartily endorsed it.

### Outdoor Switch-House Construction

Large power companies are coming more and more to buy portable switching and metering equipments in quantity, in order to be in position to connect-up desirable loads along

Fig. 1.

transmission-lines. They are thus enabled to reach small plants where the load is not large enough to warrant the expense of a sub-station with indoor apparatus. The increasing popularity of this form of equipment has naturally resulted in a steady development in the design and construction of switch-

houses, especially with a view to increasing their accessibility.

An open type of construction has recently been brought out by the Westinghouse Electric & Manufacturing Co., that provides the maximum of accessibility. In this switch-house, which is shown in Fig. 1, the oil circuit-breaker is mounted on

Fig. 2.

a specially constructed bracket and the meters are mounted on a slate-slab. The bracket is so designed that it will take different sizes of breakers.

This method of mounting the circuit-breaker has the advantage of being easily accessible for the inspection of wiring, removal of oil-tanks, inspection of contacts, and replacement of fuses protecting the voltage transformers—all very desirable features not possessed by switching-houses employing panel-mounted circuit-breakers.

A ground-mounted switch-house with panel-mounting circuit-breaker is shown in Fig. 2. The circuit-breaker and instruments are all mounted on one slate-slab, and while the construction is not as open as with the bracket-mounted breaker, it has a neat and pleasing appearance.

The tendency of power companies to buy this type of equipment in quantity is well illustrated by the Iowa Light, Heat & Power Co., which has been furnished recently with twelve switch-houses of the ground-mounting type, and the Northwestern Ohio Light Co., of Van Wert, Ohio, with five switch-houses of the pole-mounting type by the Westinghouse Electric & Manufacturing Company.

### Duplex Trucks Doing Pioneer Work

"While hundreds of miles of roads have been improved in the United States during the last few years, and as a result, motor-trucks are being used more than ever before for hauling freight from one city to another, there are thousands of miles of highway over which it would be impracticable to haul freight with the average motor-truck," declared H. M. Lee, of the Duplex Truck Co. of Lansing, Michigan. "Seventy per cent of the roads in this country are unimproved and horse and mule teams have always been used for haulage because it was found that motor trucks could be operated only at certain times. As these roads are impassable for the average motor-truck nine months out of the year, the horse and mule teams continue to be used, although many would be replaced with trucks were the roads improved. Because of their tremendous

reserve power and their dependability under adverse road conditions, Duplex trucks are being used for hauling freight in many sections of the country where motor-trucks have never been used before. More than half the Duplex trucks in operation today are doing pioneer work, that is, hauling full capacity loads where other types of motor-trucks could not be used efficiently. Turpentine operators in the South-East, oil companies in the South-West, lumber operators in the mountainous districts, pit and quarry owners in the Central States, and many contractors, manufacturers, and jobbers throughout the country, who are required to make deliveries off the pavements, are using them for the first time, because we have conclusively demonstrated that the Duplex will haul full-capacity loads wherever horse and mule teams can be used. The Duplex truck enjoys a unique position because in many instances it does not compete with other motor-trucks. It is performing haulage-work which hitherto has been done exclusively by horse and mule teams." The company is now rushing new factory buildings to completion and the output will be trebled before the first of the year. The manufacture of trucks will be centralized at Lansing instead of operating factories at both Lansing and Charlotte.

### Pneumatic Tires for Trucks

A method for reducing costs in mine, mill, and smelter transportation service has been shown since pneumatic tires have developed such great economy on motor-trucks. This was substantiated in a test-run of 4288 miles from Detroit to Mexico and return, under the supervision of Lieut. J. W. O'Mahoney, who was in command of motor-truck company No. 35 on the Mexican border. A Packard 1½-ton truck, carrying a load of over 2½ tons, and equipped with 36 in. by 7 'Nobby' tread pneumatic cord-tires was used for the test, and was run over roads similar to those found in nearly all mining districts. Economy of gasoline and oil, and far greater mileage under extremely adverse conditions were obtained. Lieut. O'Mahoney, who drove the truck, reported in part as follows: "I made up my mind that, in order to give the hardest kind of army transport test, which is the severest that any truck could ever be put to, I would not spare the truck. The amazing part of the trip is that the truck came back to Detroit after covering 4288 miles of the worst roads and 'trail blazing' that I have ever known, in practically as good condition as when it first left Detroit. This fact alone demonstrates that, if a pneumatic tire could be built to stand up under the strain of truck service, truck maintenance could be cut to a minimum. I have seen a great deal of army truck-service along the Mexican border, and with Gen. Pershing's army beyond the border in Mexico where roads are the exception, but I have never heard of such a series of difficulties as these tires overcame. We went through hundreds of miles where the roads were covered with 12 to 14 in. of soft clay, and secured ample traction. We went other hundreds of miles over roads with mixed mud and sharp stone. There were still more hundreds of miles over the sandy Texas desert. When we did not have mud, sharp stones, and hot sand, we were crashing through bridges and fording rock-bottomed streams. Under such conditions, the tires not only stood up well for 'pneumatic,' but did better than 'solids' have done. The average for the entire 4288 miles was considerably more than seven miles per gallon of gasoline. On fairly good country roads, such as are found from San Antonio to Sherman, Texas, and across Kentucky and Indiana, the consumption was about 10.6 miles per gallon. The average mileage per quart of oil for the entire trip from Detroit to Mexico and back was 33.42 miles, which proves that pneumatic tires for trucks do much to reduce the pulling-strain on the motor. I believe these United States 'Nobby' pneumatic tires will give an average of 40% more mileage per gallon of gasoline than 'solids'; that they will reduce the oil consumption

from 25 to 30%; and that by taking up road-shock they will lower the depreciation of the truck fully 50%. The 'Nobby' tread-cord truck-tires used in this test were made by the United States Tire Company.'

### Commercial Paragraphs

W. F. Stevens has accepted a position with DENVER ROCK DRILL Co. Mr. Stevens has just resigned from the H. M. Byllesby Co. at Lovelock.

On August 1 the Kewanee plant of the National Tube Co., at Kewanee, Ill., was sold to the Walworth Manufacturing Co., and on that date the National Tube Co. retired from the fitting business.

The GENERAL ENGINEERING Co. of Salt Lake City, has issued the fourth edition of its Ore Testing Bulletin. This little publication contains a great deal of information of value to those who have ore-testing problems in hand. It will be sent on request.

The WALTER A. ZELNICKER SUPPLY Co. of St. Louis, Missouri, has issued Bulletin No. 221, in which are listed what the company describes as exceptional offerings in rails, locomotives, cars, cranes, pipe, piling, and tanks. The bulletin may be had without cost upon application.

The WESTINGHOUSE ELECTRIC & MANUFACTURING Co., of East Pittsburgh, Pennsylvania, has issued an interesting illustrated publication on the electrification of the Norfolk & Western railroad. It was written by A. H. Babcock, consulting electrical engineer for the Southern Pacific Co. and will be found useful by all who are interested in recent electrical development.

The SPRAY ENGINEERING Co., 93 Federal street, Boston, Massachusetts, has issued Bulletin No. 311, which describes and illustrates the Spraco pneumatic painting equipment, embodying the recent improvements. By means of this device, painting is quickly and inexpensively done without a brush, and with no knowledge of the art of painting. A copy of the bulletin may be had by addressing the company.

MARK R. LAMB is publishing a Revista Semanal, being a folio sheet in Spanish relating to special products of the west coast of South America. It is intended as a market guide for shippers in that part of the world. Quotations are given for the common metals, tungsten, tin, the variety of rubber known as caucho, cotton, hides, and other articles. It is a sheet to supplement the activities of the brokerage house which Mr. Lamb has established at 30 Church street, New York. As the title indicates, it is published weekly. It is attractively printed and illustrated.

THE NATIONAL ASSOCIATION OF PURCHASING AGENTS is composed of the membership of local branches with a present total membership of more than 1000. Active associations exist in New York, Chicago, Philadelphia, Cleveland, Pittsburgh, Baltimore, Boston, Detroit, St. Louis, Columbus, Buffalo, Rochester, South Bend, San Francisco, and Los Angeles. The association is the outgrowth of a movement which originated in New York five years ago. The object is to bring together on common ground purchasing agents generally, to gather and to disseminate information and knowledge of benefit to the profession, to foster and promote friendly relations between members, to secure more uniform methods of routine for purchasing, and the standardization of specifications and classifications, and the dissemination of data relating to the subject of buying. The annual Congress of the Association will be held at Pittsburgh, Pennsylvania, on October 9, 10, and 11. Speakers of national reputation will be in attendance.

<b>EDITORIAL</b>	
NOTES .....	335
NEVER AGAIN .....	336
The President's reply to the Pope. Our willingness to discuss peace with a government accountable to the people, not otherwise. M. & S. P., September 8, 1917.	
THE FLOTATION UNPLEASANTNESS .....	337
Suggestions, made by the American Mining Congress, to terminate the flotation litigation and relieve the mining industry of an incubus that threatens to cripple the production of metals. The impracticability of these suggestions. Alternatives. M. & S. P., September 8, 1917.	
ESTIMATES OF ORE-RESERVES.....	338
Controversy in Canada over company statements on the subject. Desirability of informing shareholders on such matters and even giving them an annual valuation of their property. M. & S. P., September 8, 1917.	
<b>DISCUSSION</b>	
FLOTATION PHYSICS.	
<i>By Blamey Stevens</i> .....	341
A thoughtful discussion of abstruse problems in physics by a mining engineer in Mexico. The function of metallic lustre. Electricity. Gravitational attraction. Surface-tension and the function of oil. M. & S. P., September 8, 1917.	
THE AVICAYA MILL.	
<i>By M. G. F. Söhnlein</i> .....	343
A correction and an addition to information previously published. The flow-sheet of a tin-mill in Bolivia. M. & S. P., September 8, 1917.	
SCREEN-ANALYSES.	
<i>By John T. Millman</i> .....	334
A mild protest against a statement made by the U. S. Bureau of Mines. M. & S. P., September 8, 1917.	
<b>ARTICLES</b>	
INCREASED WAGES AND DECREASED EFFICIENCY IN THE CLIFTON-MORENCI DISTRICT.	
<i>By Walter Douglas</i> .....	339
The general manager for Phelps, Dodge & Co. gives authoritative figures proving the unfortunate effect on labor-efficiency caused by the increase of wages. M. & S. P., September 8, 1917.	
CAVE DEPOSITS OF NITRATE.....	340
M. & S. P., September 8, 1917.	
GEOLOGY OF THE SAN SEBASTIAN MINE, SALVADOR.	
<i>By C. Erd Wuensch</i> .....	345
A detailed description of the geology of an important mine in Salvador by a mining engineer recently returned from there. A contract-fissure carrying gold-bearing pyrite. The association of volcanic rocks. Structure of the deposit. M. & S. P., September 8, 1917.	
MINERAL OUTPUT OF IDAHO.....	350
Sources of increased production in this important mining region. M. & S. P., September 8, 1917.	
SOLUBLE FROTHING-AGENTS.	
<i>By C. L. Perkins</i> .....	351
The meaning of 'solubility.' Patent 962,678. Pine-oil and creosote. The formation of froths in flotation. Variable surface-tension. Insoluble oils useless for the purpose. M. & S. P., September 8, 1917.	
DEPRECIATION TABLES .....	352
A useful chart giving amount to be allowed for depreciation under the compound-interest method. M. & S. P., September 8, 1917.	
SEALE-SHELLSHEAR FLOTATION APPARATUS .....	353
Description of a flotation machine much liked at Broken Hill. Excerpt from the patent. M. & S. P., September 8, 1917.	
PRECIPITATING GOLD FROM COPPERY CYANIDE SOLUTION.	
<i>By Robert Lindsay</i> .....	355
How to overcome one of the chief drawbacks to successful cyanidation. A description of a practical method by a South African metallurgist. M. & S. P., September 8, 1917.	
PORTABLE ELECTRIC HOIST .....	356
A note on a portable hoist used in California. M. & S. P., September 8, 1917.	
METHODS OF CONSTRUCTION OF CONCRETE AND TIMBER FLUME FOR COVE POWER PROJECT .....	356
Novel kind of flume in use in Utah. M. & S. P., September 8, 1917.	
SOLUBLE AND ORIENTATION OF MOLECULES IN SURFACE OF LIQUIDS .....	357

Transporting Union Drill over 40 Mile Trail

## These Field Pictures Tell The Story

**The Union Prospecting Drill** is incomparably light and can be transported, handled and operated with an ease heretofore unknown for a drill having its capacity.

The Type B Drill shown in the bottom illustration weighs 2150 lb. Drills of this type are drilling 60 ft. ground and deeper, at the rate of 20 to 25 ft. a day, using 5-in. casing, which cuts a 6 $\frac{3}{8}$  in. diameter hole. The engine burns  $\frac{1}{10}$  of a gal. of gasoline per hour.

Every Drill guaranteed.

# EDITORIAL

T. A. RICKARD, Editor

**D**IVIDENDS of copper companies for the eight months of this year aggregate \$113,205,220 as against \$81,291,946 in the corresponding period of last year. The Red Cross has received \$4,149,683 from these copper companies, but that does not include the gifts of individual shareholders.

**W**E take particular pleasure in publishing an article from Mr. Walter Douglas. This shows the detrimental effect of increased wages on the efficiency of workmen in the Clifton-Morenci district. Most of this labor is Mexican, and, as most of our readers know, it is not a Mexican habit to be thrifty. Hence the higher wages have had a demoralizing effect in an economic sense.

**F**ROM the latest issue of 'The Missouri Miner' we note that the Missouri School of Mines has answered nobly to the call for service in battle. The number of former students enlisted and commissioned in the Army does honor to this School. The young mining engineers of England, Canada, Australia, and South Africa have done splendid work in the War; those of the United States will maintain the record of our profession.

**T**HE third National Exposition of Chemical Industries opens on September 24 in the Grand Central Palace, New York. It will be the largest exposition of its kind ever held. Three floors of the Grand Central Palace will be occupied by the exhibits of 350 manufacturers of chemical products. Five days will be devoted to papers and symposiums. We hope and believe that this exposition will have a stimulating effect on the chemical industry and serve to mobilize it effectively for the national purpose.

**H**EARST, it is reported, has presented Marshal Joffre with "a handsomely bound volume containing clippings of news-matter and other references" to himself on the occasion of his recent visit to the United States. We have Mr. Hearst's newspaper's assurance that "the gift is valued intrinsically at several thousand dollars." We trust that the great Frenchman will not be overwhelmed by the costliness of the gift. Mr. Hearst is a gentleman possessed of a great deal of taste, and it is all bad. Fortunately Marshal Joffre does not read English.

**W**E are informed that the American Smelting & Refining Company has brought suit for injunction and specific performance of contract against the Bunker Hill & Sullivan Mining & Concentrating Company. The

hearing on an application for injunction is set for October 18 at Portland, Oregon. As our readers are aware, the Bunker Hill & Sullivan company has built, and is now operating, its own smelter near Kellogg, Idaho. The Guggenheim smelter trust claims that in starting to smelt its own output the Bunker Hill & Sullivan is breaking a contract made in 1905. On the other hand, the mining company claims that it is acting in good faith and within the terms of its contract with the smelting company. The suit promises to be both interesting and important. We welcome the prospective disclosure of the Sunday-school methods employed in the smelting business.

**A**LTHOUGH the resilience of magnesite was known to mineralogists, it was overlooked as a factor in construction until the Germans utilized it. In the early days of the War an American company operating magnesite mines in Austria obtained the use of a large number of Russian prisoners, paying them 17 cents per day, this being the cost of subsistence. By aid of these Russian prisoners the American company hastened to dig magnesite as fast as possible, filling boxes and barrels with the mineral, preparatory to shipment overseas; but the German submarine campaign, with the consequent scarcity of ocean freightage, spoiled the scheme; and the magnesite remained at the mine until the Germans seized it, having discovered that it would furnish splendid material for gun-emplacements, on account of its resilience and the quickness with which it sets, namely, in six hours, as compared with the six days required by ordinary cement when in large blocks. The Italians also are using magnesite for their gun-emplacements. Another new use for magnesite is in making flooring or 'deck' for warships, the magnesite being laid upon steel on account of its imperviousness to moisture and heat, besides its resilience, which is a quality of greatest value in many forms of construction.

**P**UBLISHERS have received the attention of Congress to an embarrassing degree. In the legislative effort to find money for the War it occurred to somebody that the plethora of advertising supplements furnish a suitable target for taxation. As to that we cannot say, being interested. We may inform our readers that publications like ours have been compelled to pay twice the normal price for paper, whereas many big publishers have escaped the imposition owing to long-term contracts with the paper manufacturers. These have exclaimed against the cost of the raw material and have promptly cinched the small man and thereby played into the hands of the big publishers. It must be remembered that the recent

attempt to reduce the cost of news-print paper does not affect the publishers of periodicals, such as ours, which use so-called book-paper, a product of better quality and therefore much more expensive. The high cost of paper is a glaring and successful attempt to use the War as an excuse for commercial depredation. As to taxing the profits of publishers, we cannot object to that if every publisher contributes in proportion, but we deprecate the half-accidental manner in which this or that industry is called upon to divide its profits for the national exchequer; obviously everybody, every industry, ought to be taxed equally; every citizen and every business in the country ought to give a fixed percentage for the furtherance of the national purpose, which is to save this country from invasion and to prevent the destruction of the orderly way of living we call civilization.

**S**ULPHUR as a fertilizer is attracting increased interest throughout the country. The remarkable results obtained by Dr. P. J. O'Gara, who recently published an article on this subject in the MINING AND SCIENTIFIC PRESS, has led to a new demand for sulphur. It may be helpful briefly to point out the conditions under which it may benefit the growth of crops. Improperly used it might produce no beneficial effect, and, in the cases of some neutral or slightly acid soils, it would reduce the output. On the other hand, if employed with a proper understanding of the reactions and the bacterial processes involved, it is sure to stimulate the growth of leguminous and cereal crops to a marked degree. The soil must contain an abundance of humus or vegetal matter, must have a slight excess of available lime or else lime must be added with the sulphur, and the percentage of moisture should remain normally about 10%. Below 5 or above 18% of moisture no advantageous results from sulphur can be anticipated. Many of the sulphur deposits of the West, while quite unsuited to treatment for the recovery of refined sulphur, yield material that is admirably adapted for use as a fertilizer, after being ground, on account of the accompanying lime, which serves to protect the soil against acidity. Development of the use of sulphur in this way should create a steady market for the output from some of the low-grade deposits in California, Nevada, Utah, and Texas. Dr. O'Gara showed an increase of over 300% in the quantity of peas harvested from land treated under proper conditions with elemental sulphur.

**D**ESPITE the effort made by the Interstate Commerce Commission to regulate railroad freight-rates and to prevent unfair discrimination in the interest of big combinations of capital, it is noteworthy that injustice is still perpetrated, particularly in the shipment of ores and metals. For example, the rate on blister copper from Garfield (Utah) to Tacoma (Washington), a distance of 1056 miles, is \$6 per ton, whereas the rate on pig-lead from Kellogg to Vancouver, a distance of only 510 miles, is \$4.50 per ton. The copper is worth \$500 per ton, and

the lead only \$210 per ton, so that the valuation is not allowed to affect the rate logically. This comparison is striking, but a more striking contrast is afforded by the schedule on ore produced within the State of Washington: on ore having a value up to \$100 per ton the rate is \$9.25 for a haul of 400 miles at the most. Thus a \$500 product is carried 1056 miles for \$6, whereas a \$100 product is carried 400 miles for \$9.25 per ton. A still more glaring inequity is disclosed by the fact that \$100 ore hauled from Weiser to Tacoma is charged \$6.50 on a distance of 566 miles, whereas the \$500 copper product from Garfield is carried through Weiser, which is half-way between Garfield and Tacoma, for 50 cents per ton less. Thus a product of one-fifth the value of the copper is charged 50 cents more per ton on a haul of half the length. All this information is abstracted from the published tariffs of the railroad companies, and from the official time-tables, in which the distances between points are given. Any reader can verify our statements for himself. What is the reason for such curious discrepancies? We venture to draw the attention of the Interstate Commerce Commission and of the State Public Service Commissions. Undoubtedly the rates quoted above operate to the advantage of the Guggenheim smelter trust and to the disadvantage of the smaller operators of mines.

## Never Again

His Holiness the Pope has been the means of eliciting a frank expression of American policy. To us the latest note of the President is his best; it is short; it is to the point; and it enunciates clearly our object in this war. "We seek no material advantage of any kind." Our object is "to deliver the free peoples of the world from the menace and the actual power of a vast military establishment controlled by an irresponsible government, which, having secretly planned to dominate the world \* \* \* now stands balked, but not defeated, the enemy of four-fifths of the world." Again the President makes the distinction between the people of Germany and the German government. He recognizes the impossibility of dealing with the Potsdam crowd, the gamblers that played with chips of humanity and counted upon bluffing their opponents; and, if they failed, then to let loose the powers of hell carefully prepared for many years. With them we can make no peace because they are out-laws to whom solemn agreements are scraps of paper. The President says, "We cannot take the word of the present rulers of Germany as a guarantee of anything that is to endure, unless explicitly supported by such conclusive evidence of the will and purpose of the German people themselves as the other peoples of the world would be justified in accepting." So far the German people have been more unflinchingly loyal to their rulers than any other people. Signs of an understanding by them of the manner in which they have been exploited by the Potsdam military party are beginning to multi-

ply. When the German people disassociate themselves from the predatory enterprise of their Prussian leaders we shall be able to talk peace; until then any compromise would only afford another opportunity for a more advantageous assault upon civilization. There must be no 'next time.' This horror must not be repeated. 'Never again' is the motto of all the Allies. This is a war to end war. We await the day when the German people will repudiate the trespass, robbery, arson, rape, murder, and slavery that have turned a peaceful neighbor's land—Belgium—into a shambles, a dissolution, and a mark of the beast. We fight that such a crime shall never again be permitted and that American soil shall never again be in any danger of a similar fate.

## The Flotation Unpleasantness

Patents have come to be regarded as public nuisances rather than the legitimate reward of inventive genius. That is because few men know how to use their rights under a patent without becoming porcine. During this period of war the litigation engendered by doubtful rights becomes an impediment to the utilization of national resources at a time when unhindered effort is most needed. The fight over the flotation patents is a case in point. It is bad enough that a number of great mining enterprises should be harassed by the claims of patentees, but a larger number of smaller undertakings are restrained altogether from taking advantage of the foremost ore-dressing discovery of our day—a discovery due to the effort of many men in many places and not to the cleverness of one man or one group of men—because they can neither afford to pay either the royalty or the other exactions demanded nor to pave a way with gold through a succession of courts. The confusion caused by the litigation is due largely to the fact that the Minerals Separation people set out to monopolize flotation before they understood what it was; they made claims that subsequent physico-chemical investigation has proved incompetent as a basis for the most successful application of the process. It is the old story of the so-called 'basic' patent: to be basic it must stand on newly discovered principles, and in the case of flotation the Minerals Separation people have failed to advance a definition that would hold before a jury of physical chemists. They did not know the rationale of the process that they attempted to monopolize and if they ever do come to understand the fundamental principles of the process it will be because many others outside of their organization have contributed to the result.

The foregoing remarks will serve to introduce the announcement, made at Washington, that the American Mining Congress is to urge that one out of three drastic steps be taken to terminate the unpleasantness arising from the Minerals Separation company's campaign to impose a royalty on the production of metals. The first suggestion is, "That the Minerals Separation company shall immediately adopt a liberal policy by the fixing of a

fair and justifiable charge for the use of its process and the relinquishment of its apparent purpose of establishing a continuous and burdensome monopoly." This is a pious idea, but how is it to be put into action? The owner of a patent has a legal right to exact even an unreasonable royalty from those whom he licenses to use his patent; moreover, the intent of the law apparently is to give him an unrestricted monopoly in the use of the device or process that he has patented. Who is to curtail the exactions of the Minerals Separation people? The Government, one would suppose, cannot withdraw the privileges it has granted under the law, except by agreement with the patentees; this involves monetary compensation for the rights to be withdrawn. Some such notion underlies the second 'suggestion' made by the Mining Congress; this is, "That the Government, through the Council of National Defense, shall fix a reasonable charge for the use of the process." Here we have the idea of national emergency in time of war and an over-riding of the law in the interest of patriotic service. It can be done, on the principle of *inter arma silent leges*, but any good democrat would hate to see it done. In England they have a law called the Defence of the Realm Act, called 'Dora' for short, a legal and patriotic juggernaut for authorizing the Government to make short cuts toward aiding and expediting the work of warfare; but Great Britain has no written constitution. The enactment for food-control gives the President sundry such powers and if necessary further authority to the same purpose might, and probably will, be granted to him and to the members of his administration. That brings us to the third 'suggestion' of the American Mining Congress, namely, "That Congress shall annul the rights granted by the patent." Nobody will deny the possibility of Congress doing this, but any such legislation would be subject to revision by the Supreme Court. Annulment of patent-rights by Congress would be unconstitutional, presumably, and therefore would be vetoed by the super-legislative authority. We can discover nothing practicable in these suggestions of the Mining Congress, although we share the irritation, common to the entire mining industry, caused by the exactions and embargoes of the patent-exploiting company. The dispatch from Washington says that the 'Journal' of the Mining Congress charges the Minerals Separation company with sundry acts of malfeasance. "It demands that its licensees shall give it the full benefit of any invention or discovery made by them which may be an 'improvement, modification, or addition,' or 'may be useful in carrying out any of the processes thereby protected,' and the right to patent for its own use any invention made by its licensees and further requires its licensees to 'bind their employees to assign or transfer to the licensor any invention made by such employees'." It requires its licensees to pay a royalty "in each and every instance computed on the entire metal value recovered from all ores and material treated by the licensee, provided any portion of such value has been recovered by flotation."

We quote this verbatim because it corroborates much that we have said in these columns during the last two years. The Minerals Separation company insisted that the Britannia Mining & Smelting Company, for example, should pay royalty not only on the concentrate obtained in jigs and tables, before flotation, but also on the ore sorted by hand from a picking-belt in the mill, and shipped direct to the smelter. An impudent effort to bluff the profession was exposed in our issue of February 5, 1916, in which we reproduced the form of contract imposed upon metallurgists in the employ of a licensee, and in the same issue we quoted competent legal opinion concerning the invalidity of this contract. We are glad that the American Mining Congress is taking the matter in hand, for it is one of large moment to the mining industry. We should like to see the Mining Congress take further action in the matter and in order that such action may be effective we suggest that, for instance, an effort be made to expedite the present litigation. When the U. S. Supreme Court decided the Hyde case it was hocus-poused by the plaintiff's assertions concerning the so-called critical point. This has been stultified by later work on a large scale in various mills. The Miami case is not going before the Supreme Court because the record in that case does not include the latest evidence. The Butte & Superior case will go before the Circuit Court of Appeals and then an effort will be made, whoever wins, to bring the case before the Supreme Court on a writ of certiorari. It is greatly to the interest of all concerned, not the litigants only but the whole metal-mining industry, that the decision of the Supreme Court be handed down with as little delay as possible. If the Supreme Court, after hearing all the latest evidence on the rationale of flotation, decides in favor of Minerals Separation, the only thing to be done will be to float without oil and without the soluble agents covered by the Minerals Separation patents, or to pay the royalty. Meanwhile it is to be remembered that there are other patents besides those of Minerals Separation and the pending litigation does not cover anything like the whole field of possible controversy. If Minerals Separation fails in obtaining a monopoly, it is not likely that others will be encouraged to imitate its exacting methods.

If, however, the Government can be persuaded that the production of the copper necessary for munitions is being hindered by the exactions, or attempted exactions, of the Minerals Separation people, then the President and his advisers may see fit to use the power given them by Congress to curb the patent-exploiters. A condition somewhat similar existed until recently in the manufacture of aeroplanes; the patents owned by rival companies retarded the development of aviation in this country so much as to leave our designers, the originators of the successful heavier-than-air type of avions, far behind the French and Germans. We found ourselves practically without an air-fleet, and almost destitute of trained pilots, at a moment when it became apparent that a strong aerial navy would have turned the tide of war more quickly and certainly than anything else. The

prohibitory price of aeroplanes and the inability of either of the two competing manufacturers to utilize all the improvements required for safe and successful aviation prevented such private initiative as would have developed aviation and aviators in this country. The patents stood in the way. Thereupon the Council of National Defense stepped between the rivals and made peace between the Wright-Martin Aircraft Corporation and the Curtiss Aeroplane Company. Co-operation between these two is now assured for the welfare of the country, and for their own good, by means of a cross-licensing agreement giving the advantage of all the patented mechanical ideas to each manufacturer. This establishes a precedent that may warrant action in the flotation unpleasantness. If the Government can regulate the price of copper, why should it fail to regulate the royalty to be paid by the producers of copper for the use of a metallurgic process necessary in the production of copper?

## Estimates of Ore-Reserves

Our Canadian friends have engaged in vigorous discussion over a suggestion, made by Mr. R. W. Brigstoke, that the official estimates of ore-reserves as given in the annual reports of mining companies should be verified by an independent engineer. Messrs. John E. Hardman, R. B. Watson, and E. P. Mathewson have joined in condemning this proposal as impracticable. Mr. Fraser D. Reid suggests that mining companies should be compelled to file an affidavit stating exactly how their estimate was obtained. Apparently these Canadian engineers are unaware that several British companies have been in the habit of doing something of this kind. Thus Mr. C. E. Knecht, manager of the Brakpan, and Mr. William McC. Cameron, formerly consulting engineer to the Goerz group, used to furnish an interpretation of the data on which their estimate of ore-reserves was based. Other London companies give such information frankly, although unfortunately the majority not only withhold it but give their estimates in a confusing way. Of course, the shareholders, who are the real owners of a mine, are entitled to have such information and to have it in the most explicit fashion. The whole policy of mine administration, especially in this country, is saturated with the idea that those in control are entitled to inside information, and after them their friends, leaving the minority shareholder in a cold fog of ignorance. We go further and say that not only should vital statements, such as the annual estimate of the mine's resources, be accompanied by all the explanation necessary to make them intelligible and convincing, but we would suggest that the board of directors in their annual report should appraise the mine, stating what in their opinion, based on the advice of the company's engineer, is the present value of the property. They make such a valuation in their own interest, as large shareholders, and we see no reason why they should not give the other shareholders the benefit of their opinion, not as individuals but as trustees for the shareholders.

# Increased Wages and Decreased Efficiency in the Clifton-Morenci District

By WALTER DOUGLAS

As an interesting and instructive commentary upon the effect of greatly increased wages on the manual efficiency of a certain class of mine-labor the accompanying diagram speaks for itself.

In the summer of the year 1915, at which time a sliding scale of wages was put into effect by the management of the Detroit Copper Co., the average pay of wage-earners in the mine department was approximately \$2.50 per day, which average included a large force of surface-laborers, whose \$2 rate served to offset the considerably higher pay earned by the miner and other underground labor. At this time the number of tons mined per man, exclusive of those engaged on development work, was 2.6. For the first six months of the year 1917, with an increase of wages that brought the average daily earning to \$4.10, the number of tons of ore mined per man dropped to 2.18; in other words, the cost for labor to mine a ton of ore in the early part of 1915 was 90 cents, while for the first six months of 1917 it increased to \$1.90. The miner who earned 36½ cents per hour, based on 15c. copper, during the former period earned 56½c. per hour in the latter period on 28c. copper.

The labor employed in the mine department of the Detroit Copper Co. since the initiation of the company's operations in 1880, has been, and is now, largely Mexican, with a substantial proportion of Spaniards and a few Italians.

In September of 1915 the Western Federation of Miners sent organizers into the district; these, largely owing to the strained relations existing between the United States and Mexico at the time, were successful in inducing all the Spaniards and a number of Mexicans to join their organization. They then demanded recognition of the union, which, being refused, a strike was called. It is unnecessary here to recite the history of this strike, which, through incendiary speeches by the then Governor of the State, assumed the aspect of a revolution, in which all workers who would not join the Federation were deported from the district. No attempt was made by the operators to introduce outside labor, and in February 1916, through the efforts of Federal mediators, Messrs. Myers and Davies, the union surrendered its charter, work being resumed under the same conditions as existed before the strike was called.

At the suggestion of the mediators, the operators consented to the election by the employees of grievance committees to discuss with the management matters relating to wages, conditions of labor, etc. Unfortunately for the

future peace of the district, the men elected to these committees were of the most radical type. Prompted by J. L. Donnelly and other officials of the Arizona Federation of Labor, they assumed the right to dictate to the operators not only who should or who should not be discharged, but who should be employed or promoted.

Whenever the management declined to accede to these demands a strike was called either in one department at a time, or all the employees of the companies were called out simultaneously. Nine of these strikes have occurred in the 15 months since operations were resumed. These methods not having been entirely successful, in the

opinion of the Federation, in obtaining all their demands, a system of sabotage was introduced underground. This apparently appealed strongly to the class of labor employed, and was effective in reducing the ton-man efficiency. As an example: In May last the management having decided to concentrate its tool-sharpening operations, thereby being enabled to dispense with six or eight Mexican blacksmiths, the grievance committee protested, and not being able to convince the management of the validity of their contentions there was introduced a system whereby thousands of feet of steel was buried in the stope-filling and the company not only put to great expense, but its operations necessarily hindered until an additional supply could be obtained. Discipline underground became impossible and insubordination was rife.

In June last the employees of all the companies operating in the district, through the instigation of the Arizona Federation of Labor, and with its endorsement, demanded the so-called Miami wage-scale. Declining to await the arrival of Mr. Myers, the Federal mediator, they called a strike that has suspended all operations in the district for the past five weeks.

It is an interesting fact that while the operators in the so-called Morenci-Metcalf-Clifton district do not recognize the union—the grievance committees consisting exclusively of employees of the mining companies—yet this district is the most completely unionized in the State of Arizona. The instructions to the grievance committee are issued by the union and the strike was called by it. When it is understood that the tonnage of ore produced per man in the mines in this district is only 2.18 as compared with nearly 13 tons at Miami, the comparison of the wages paid at the two points will appear to be greatly in favor of the Morenci district.

Most readers of this statement will naturally wonder why, if such conditions exist with this class of labor, American miners are not employed, and the wages and efficiency increased. Local conditions have in the past governed this matter, but the main reason at the present time is that there are not enough American miners to man the mines of the State. Then again, the Mexican workmen of the district have been in most cases resident there for many years and are individually a desirable well-meaning class of workmen. They are unfortunately racially susceptible to the socialistic arguments of agitators and easily influenced by oratory of the I. W. W. type, with whose doctrine the Arizona Federation of Labor is permeated. They cannot understand that the union, which persuades them to demand the wages that are paid to the highest class of intelligent miner, does so with the object of eliminating them as an industrial factor in the State's labor forces. The union that sponsored this strike of highly-paid Mexican workmen was the author and active advocate of the notorious 80% law, which prohibited the employment of other than qualified electors or native-born citizens and which was declared unconstitutional by the Supreme Court of the United States.

## Cave Deposits of Nitrate

The accumulation of nitrogenous deposits in caves is a well-known fact but the extent to which this sometimes takes place is not fully appreciated. A letter, recently received by the U. S. Geological Survey describes a cave in one of the Southern States that was worked by the Confederacy during the Civil War for potassium nitrate. This cave is said to contain at least 1,000,000 tons of nitrous earth, which, however, contains only 1 to 2% of nitrate. The Survey now states that it seems doubtful whether such material can be profitably used as a source of nitrate salts. The minimum grade of caliche now worked in the Chilean fields contains 12% of sodium nitrate, and though there has been much criticism of the crudeness of the methods employed there, the work is done by cheap Indian labor, and it is doubtful whether leaner material could be worked to advantage here, where the price of labor is so much higher. Several hundred thousand dollars has recently been expended in one of the Western States in testing the proposition to utilize low-grade nitrate. The results have been negative. The nitrate caves in the South were worked during the Civil War by crude methods. Generally the cave-earth was shoveled into iron pots, where it was treated with water and heated over wood-fires to leach out its soluble parts. The liquor was drawn from one pot into another and used for treating fresh material until it became a highly concentrated solution of nitrate salts. It was then drawn off and allowed to cool, whereupon the nitrate crystallized. The remaining liquor was then employed to leach fresh material and the crystals were separated and sacked for use. It is doubtful whether there are any caves of this nature in the West, but one cave at least has been discovered in Nevada from which a considerable quantity of 'bat guano' was marketed.

BRADSTREET's index-number of commodity prices for July 1 is \$16.068, a new high level. It shows an increase of 3.8% over June 1. This upward sweep nearly coincides with that witnessed in England in the same period. Bradstreet's index-number reflects the eleventh consecutive advance noted within as many months, and it also exhibits a rise of 39.4% over July 1, 1916, and of 85.6% over July 1, 1914, just before the outbreak of the War.

FRESNO, Tulare, and Monterey counties have supplied feldspar to California potteries. There are large areas of granitic and metamorphic rocks in the Sierra Nevada mountains which contain pegmatite dikes but the U. S. Geological Survey states that there is little information concerning their commercial availability.

GASOLINE extracted from natural gas in this country increased from 65,364,665 gal. in 1915 to 104,212,809 gal. last year. The quantity of natural gas from which this was derived amounted to 2080 million cubic feet, or approximately 0.5 gal. per 1000 cu. ft., according to the U. S. Geological Survey.

# DISCUSSION

*Our readers are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy. The Editor welcomes expressions of views contrary to his own, believing that careful criticism is more valuable than casual compliment.*

## Flotation Physics

The Editor:

Sir—Your recent editorial hits the nail on the head when it says that the physical phenomena of flotation must be associated in some way with what we term 'metallic lustre'. Certain ideas related to this had been in my mind for a considerable period, and I propose to let you have them for what they are worth. Metallic lustre means the effect of light on a metal. First we must know what light really is and then see what is its particular behavior with metals. About the middle of the 19th century Clerk Maxwell and others of the more advanced scientists of that day developed a theory of the electro-magnetic character of light. Speaking in terms fitting for use among mining and metallurgical men, this was about as follows: Light corresponds to a movement or rate of displacement of electricity in the ether. This generates a magnetic stress or strain at right angles to it, and the change of magnetic strain in turn generates electric stress, so that there is a progressive transverse wave of these causes and effects transmitted through the ether in somewhat the same way as mechanical stresses and strains combine with dynamic properties to cause a transverse wave to travel along a stretched cord.

Trying to connect this theory with the facts of the transmission of light through material bodies, Maxwell saw that only those substances which—like ether—would not conduct electricity would conduct light. If a substance conducted electricity it would not stand electric strain, because electricity ran from one part of it to another in such a way as to neutralize any strain. Of course, some substances were seen to be opaque, merely because light was absorbed and turned into heat in them, but other substances, such as most metals, reflected a large proportion of the light. This was realized to be due to a reaction or rebound occurring normal to the surface, due to its being the boundary or end of the conducting medium past which no electric strain could pass. The law of equal angles of incidence and reflection was thus obtained and also a law of refraction showing the constant ratio of the sines of the angle of refraction and the angle of incidence.

If that had been all there was to it the scientists of that day might have been happier, but those of today would have had a smaller field for further discovery. The difficulty they met was that transparent substances had a different index of refraction for each different shade of the light of the spectrum; in fact, that was in

those days the way they always made a spectrum.

Toward the end of the last century Sir William Thomson, (afterward Lord Kelvin) in the course of his efforts to unravel the mysteries of the atom and the molecule, brought forward a theory that I shall try to explain in simple language. The theory in physics does not necessarily aim to be an ultimate and final explanation, but it is more than a hypothesis, because it ex-

FIG. 1

plains all well-known phases of the subject to which it relates. It is understood, however, that the discovery of further facts may make necessary a revision of the theory. As it stands the theory serves as an important basis for scientifically correlating all well-known facts in regard to the subject. It is in this sense that the

FIG. 2

theory of the constitution of the atom, as advanced by Kelvin, is to be understood. It states that the atom is made up of equal amounts of positive and negative electricity. When we understand more exactly what electricity is, we may have to make some modifications of this statement. Negative electricity is, however, presumed to consist of small bodies called electrons, which all carry equal charges or are themselves the charges. Positive electricity is less definitely understood, but is presumed to be a kind of atmosphere constituting the body or nucleus of the atom. The electrons move in or

about the positive charge in orbits, being attracted to it as planets are to a sun, but by reason of the opposite nature of the charge. The atomic weight is presumed to be proportional to the positive charge and is also proportional to the negative charge or the number of electrons taking part in the atomic structure. The details leading to the above conclusions are matters of pure physics, and I shall concern myself here with such deductions from the theory as will help to solve our particular problem.

Suppose each of two atoms (Fig. 1), equal in all respects, to consist of a single electron within a sphere of uniform positive electricity. If they do not touch one another, we know by a general theorem, worked out by Newton for gravitational attraction, that the effect of the repulsion and attraction due to the spheres will be just the same as though their whole effective substance were concentrated in the geometrical centre. Hence there is no resultant attraction or repulsion as between the atoms, as long as they do not touch one another. The theory of gravitational attraction tells us that if the spherical atmospheres lap on one another (Fig 2), part of the repulsion between these positive electric atmospheres is neutralized. The repulsion of the electrons remains the same, and the attraction between the positive and negative charges remains the same. Hence the algebraic sum is no longer zero but in favor of the attraction. The centres of the atoms cannot approach one another indefinitely, however, for the inclusion of one electron in the positive atmosphere of the opposite atom tends to diminish the mutual attraction.

This then constitutes our theory of the force that holds two or more equal atoms together, and accounts incidentally for surface-tension.

An atom must, in general, have more than one electron and is believed to have a large number. It would therefore be possible that the inter-lapping of the orbits of the electrons, when revolving in a concentrated charge of positive electricity, would produce a result similar to that I have described.

Following the original presumption of the positive electric atmosphere and supposing a number of electrons in each atom, we may suppose that when two equal atoms are in contact, the electrons pass from one to another of the positive atmosphere. If the two equal atoms are then separated by some outside force, the establishment of equilibrium requires that the same number of electrons remain in each atom:

If, however, the atoms concerned are unequal, we cannot make any such supposition, and it will be possible that when two atoms of different sorts separate from one another, one will carry with it one or more electrons of the other, and thus one atom will have one or more units of negative electric charge and the other atom an equal positive electric charge. These charged atoms are called 'ions'.

Upon the above theory are based all of our modern ideas of the relation between electricity and matter.

On the one hand, it has given rise to efforts, such as those of Larmor and J. J. Thomson, to get a more definite knowledge of the constitution of the atom; on the other hand, it has given us a much more exact knowledge of the constitution of solutions, of galvanism, and of chemical reaction in general, and it has been extensively applied by practical chemists in correlating and putting their work upon a more truly scientific basis.

According to this theory of matter, the nature of electric conduction is about as follows: In any metallic solid there are many positive ions. Unlike the ions of a solution, those of a solid metal are fixed in one position. The electric neutrality of the metal as a whole is brought about by there being, within the metal, electrons (negative electric particles) which pass from atom to ion. Under normal conditions there is a continual interchange of this sort, and consequently a continual motion of electrons in all parts of the metal. These motions, however, are such that a balance of electric equilibrium is retained within the metal.

As in the case of cohesion, which you have well described, there must be a surface or boundary condition which retains or reacts upon the condition of stress, or strain, or heat, or charge—or whatever we may call it—within the surface.

This boundary condition (which we might call electronic surface-tension) is well recognized in galvanics. The copper plate of a galvanic cell, for example, must be supposed to have on its surface a latent charge of negative electricity, even before any circuit is made, and before any zinc pole is inserted in the solution or electrolyte. Otherwise we cannot explain how galvanic action can be started. This hypothesis was in fact put forward, quite independently of any modern theory, by the early galvanists.

Now we may better consider the effect of the metallic surface in flotation. Consider the metal immersed in oil. The metallic side of the boundary tends to become charged with negative electricity (electrons). The other side is composed of a dielectric, that is to say, a substance in which there are no ions or loose electrons, and which resists their formation. The molecule of oil is electrically self-contained. The electrons of the surface of the metal are attracted into close contact with the positive portions of the oil atoms or molecules, and without entering them, form a close bond. The electrons of the oil molecules move away as far as they can, by repulsion but cannot leave their own molecules (unless the dielectric rupture stress is reached). This electric displacement is in turn induced in molecules farther from the surface. A bond of adhesion is thus formed at the surface of contact of the metal and oil.

If we now consider the contact of a metal and an electrolyte, we find that the main difference between the metal and the electrolyte is that the ions of the former are fixed, while those of the latter are free to move. Positive ions are attracted to the surface of the metal and stay there, and the corresponding negative ions are

repelled from it, initiating a latent charge in the mass of the electrolyte. The neutral dielectric water molecules have no part to play, being neither attracted to nor repelled from the now neutralized metallic surface. The water may therefore be easily separated from the surface. The number of ions necessary to neutralize the latent electrical condition of a face is very small, for a single ion contains quite a large charge.

It might not be altogether out of place to illustrate the difference between the two actions by supposing an electrified conductor placed on one side of a thin piece of glass. On the other side we place an unelectrified conductor of some considerable thickness. The two conductors will then adhere to the glass. This is the case of metal and oil.

To illustrate the opposite effect we allow two differently electrified conductors to come together. Immediately they become equally electrified and begin to repel one another.

The part played by surface-tension should not be overlooked. We have to deal with the combined effect of this and the electrical action we have just described. Oil will wet quartz and water will wet a metallic surface. The electronic action would appear generally to rule. It is all important, however, to recognize the pairing of the unlikes, the solid conductor with the liquid dielectric and the liquid conductor or electrolyte with the solid dielectrics.

It might be useful to know whether the preference of

oils, in general, for pure metals does not follow the order of the latent potentials of their surfaces, which is also approximately the order in which their sulphides are precipitated from solution by sulphureted hydrogen. If the adhesive quality of oils has approximately this same order, an apparatus could be devised to find electrolytically the corresponding order of all metallic minerals.

BLAMEY STEVENS.

## The Avicaya Mill

The Editor:

Sir—In your issue of June 2, Dr. F. C. Lincoln publishes a brief description of the Pazña tin-mining district of Bolivia, in which he gives a flow-sheet of the Avicaya mill. This flow-sheet is neither complete nor correct, but it would not be fair to blame Dr. Lincoln for this error, since during his visit to the mine all work had been suspended on account of the usual August holidays, and it is difficult to obtain a concise idea of the work that is being done in a mill that is not running. The writer, who has been during part of the time in charge of reconstruction work at the Avicaya mill, thinks it may be of interest to publish the flow-sheet of the mill as it was

FLOW-SHEET OF THE AVICAYA MILL.

operating in the beginning of December of last year when the re-arrangement had been completed.

The tinstone occurs in the ore in small patches and stringers in vugs and on cleavage-planes. It is sometimes of exceptional purity, but more generally intimately combined with iron oxides in the surface ore and with pyrite and arsenopyrite in the ore from lower levels. The gangue itself does not contain appreciable quantities of tin. These conditions call for an initial coarse crushing so as to recover the clean mineral in as large grains as possible and to eliminate the bulk of lean gangue without grinding it unnecessarily fine. The middling from the first concentrating operation contains the mixed grains of tin and iron minerals and must be ground very fine in order to separate these minerals.

The accompanying flow-sheet shows how this has been accomplished in milling practice, the tin-iron middling being kept in circulation over the two Wilfey tables and through the ball-mill until it is either ground fine enough to overflow the classifier and pass to the slime-plant, or has been separated into concentrate and tailing. It should, however, be said that a small part of the mixture is so fine that there is practically no limit to the size of the combined grains, and those grains are found in the middling from the last slime-tables, passing finally into the tailing.

The object of the drag-classifier is to obtain separation of the bulk of the slime in an entirely automatic way that cannot be interfered with by the mill-crew, and if the hydraulic classifiers, which were installed with a view to finish the de-sliming of the drag-belt separated sand, were not correctly operated no very serious losses could result. Instead of classifying the jig-tailing and sending the very diluted overflow of the de-watering cone to the Dorr thickener, it would, of course, have been more practical to install a hydraulic classifier in front of the revolving screen and separate the slime with less water, but there was no height available at this point of the mill.

The mill-ore did not average more than 4 to 5% sulphur, but pyrite and arsenopyrite would accumulate to such an extent in the concentrate that roasting and re-dressing of the product was imperative. The concentrate as produced by the mill would carry 50 to 55% tin, and after roasting it in a small hand-rabbled reverberatory furnace and washing out some iron oxide by hand, it was passed over a small magnetic separator so as to eliminate metallic iron which had entered the tin-product through abrasion of the crushing machinery. The concentrate was finally shipped with about 65% tin, and the tailing resulting from cleaning the roasted concentrate was periodically returned to the Dewco ball-mill.

Since the management has passed into other hands at the beginning of 1917, I am not able to say whether the mill is at present running along these lines.

M. G. F. SÖHNLEIN.

Machacamarca, Bolivia, July 6.

[We are much obliged to Mr. Söhnlein for this interesting information.—EDITOR.]

## Screen Analyses

The Editor:

Sir—I read with some surprise the statement recently made in the U. S. Bureau of Mines Year-Book, as reproduced in abstract in your issue of August 18, in which it is said the finely divided amorphous material in dry pulp must be removed by washing prior to sizing by screens for the purpose of making a screen-analysis that may be depended upon to yield concordant results. In the first place it is a loose use of technical terms to call the fine material adherent upon the larger particles 'amorphous'; it may or may not be amorphous, but it certainly is fine, and that is all that the writer evidently meant. Examination of the more minute particles produced by fine crushing, when made with the aid of a microscope, does not by any means reveal that they exist in an amorphous condition, if by that is meant a non-crystalline condition. In the next place, the writer suggested removing this by washing. The effect of that is often completely to alter the character of the sample. Moreover, I venture to assert that if the Bureau of Mines experimenters will study the pulp after sizing they will discover that the separate larger particles will contain as much adherent fine material as similar particles did in the unwashed pulp. While no means is entirely effective for making clean-sized products in screen analysis, the use of vacuum-cleaning gives altogether the best results, and it is quite the best practice to clean the sized products after screening, then adding the dust collected to the under-size from the finest mesh in the series of screens employed.

JOHN T. MILLMAN.

San Francisco, September 1.

---

MAINTAIN good order and cleanliness. This is the first step toward effective fire prevention. Wherever excelsior, papers, straw, or other materials are used for packing, keep only a day's supply on hand in a box or bin, lined with tin and provided with a counter-weighted door having a fusible link to insure automatic closing in case of fire. Use standard waste cans as receptacles for such materials as oily or soiled waste, rags, or excelsior. Burn under boilers or elsewhere all such material as is past usefulness every day before closing. Do not permit the accumulation of any waste combustible material near buildings, especially those of wooden construction. Shingles or other refuse from the building, waste paper, old lumber, and empty boxes are sometimes neglectfully allowed to accumulate in such places. Provide metal lockers for the clothing of employees. These minimize the danger of hot pipe in the street coat or a bunch of waste in the overalls pocket. Place dressing rooms in accessible places where fire can be easily controlled.—Nat. Board of Fire Underwriters.

SEARLES LAKE is estimated to contain 20,000,000 tons of potash, an amount sufficient to supply the needs of the country for 15 years.

# Geology of the San Sebastian Mine, Salvador

By C. ERB WUENSCH

The San Sebastian mine is situated in one of the numerous volcanic mountains of the coast-range of south-eastern Salvador, Central America, in the Department of La Unión, about 30 miles north of the port of the same name. The mountains, though very rugged, nowhere rise over 2000 ft. above sea-level. Several of the mountain slopes are abnormally steep suggesting faulting. The gulches are sharp, the stream-beds in the vicinity of the mountains contain no gravel, and invariably the solid rock is exposed. The sub-soil is seldom more than 5 or 6 ft. deep. These features are evidences of strong erosive action.

The ore deposit consists of contact-fissure veins carrying gold-bearing pyrite. The veins occur at the contact between a quartz-monzonite porphyry dike and the surrounding eruptives, which are basalt capped by trachyte. In a few cases small orebodies are found in simple contraction-fissure veins in the trachyte. All the rocks are of recent age, probably late Tertiary. During the first volcanic activity the whole region was covered by a flow of basaltic lava, which must have been not less than 3000 ft. thick, which extended irregularly over a great portion of the region. There followed a period of volcanic inactivity during which erosion removed much of the basalt and produced the irregular surface upon which now lies the trachyte. The tuffs, pumice, and glasses belonging to this eruptive period have all been eroded. A second period of vulcanism followed along the same fissures, during which the trachyte was ejected. The trachytic lava being more acid and hence much more viscous, piled up close to the vent and covered only a small area. The trachyte flow must have been at least 500 ft. thick. At the close of the trachyte flow, after the outer portion had cooled but before the interior had solidified, the quartz-monzonite porphyry was intruded along the original lines of weakness, into the trachyte. The uniform coarse-grained texture of the monzonite shows that it solidified under conditions of slow cooling and pressure. Because of the differences in the coefficients of contraction between the viscous and partly cooled trachyte, the superficially heated fissure walls in the basalt, and the molten monzonite, torsional strains were exerted which produced the irregular fractures, slips, and fissures along which the ore was deposited. After the monzonite intrusion, heated aqueous solutions charged with mineralizers ascended in close proximity to the dike. Reduction of pressure was apparently the important factor in bringing about deposition, for the ore is found along fissures and small fractures. The veins were formed by replacement, sometimes extending to unusual distances from the fractures, and they

were not only formed in the trachyte but in the basalt as well.

The structure of the deposit is perhaps the most important feature. By consulting the section on *A-A'*, it will be noticed that the lower limit of the ore-zone is determined by the slope of the basalt-floor upon which the dike rests. Likewise the basalt approaches the vent of the dike from the east. The bottom of the deposit is structurally well defined. Vein I (see section on *B-B'* and the map of the surface) distinctly 'bottoms' on the basalt. This is on the 300-ft. level of the mine at an elevation of 850 ft. The lower portion of the vein contains heavy barren secondary sulphides, and as it de-

GEOLOGICAL SECTION ON BB: SAN SEBASTIAN MINE

scends in depth mineralization and silicification become poorer and it gradually merges into fresh, unfractured basalt. Likewise vein II terminates against the basalt to the west and continues in depth toward the east to about 50 ft. below the 700-ft. level, below which point no ore has ever been developed. On the 700-ft. level considerable secondary sulphide was found, though ore was found erratically in rich pockets. On the 800-ft. level are some heavy barren secondary sulphides, but a general impoverishment in mineralization and silicification is evident. Vein III was uniformly mineralized in the oxidized zone, but at the 100-ft. level, 50 ft. below the lowest point of the outcrop, when the ore turned into sulphide it became spotty. Rich shoots, however, were found until the 300-ft. level was reached, below which it is universally barren. On the 400-ft. level the vein is heavily mineralized, but with barren secondary sulphide. Veins IV and V behaved similarly. Vein VI is unique in that the ore lies entirely in trachyte and 'bottoms' upon the top of a sill from the dike as shown in the section on *C-C'*. As the dike is approached the sulphide becomes barren, and disappears just before the dike is reached. This ore-zone has thrown light upon the method of fracturing. The fractures are quite

irregular. The whole knob of the hill in which these veins are found is composed of slips, cracks, and fractures which strike and dip roughly at 90° to each other as shown in the section on *C-C'*. The majority of the fractures are warped surfaces and not planes. This system of fractures shows a striking resemblance to those which Daubreé produced in his classic experiment with a mass of resin and beeswax. Veins VII and VIII are not of the same type as the others, as has before been mentioned. They are relatively unimportant and have produced only a small amount of ore, averaging about one ounce in gold. The veins are simple contraction-fissures in the trachyte. The ore was apparently derived from the small amounts of gold present in the trachyte and was deposited by vadose waters along the kaolinized walls of the fissures. The streaks are seldom more than small cracks filled with kaolin and granular quartz stained by limonite and hematite. In the vicinity of these veins the trachyte has suffered the type of alteration so common to rhyolites and trachytes, that is, a general silicification of the groundmass. The veins 'pinch-out' within a hundred feet of the surface.

Invariably the ore is confined to fractures or contacts, whereas silicification may have extended for unusual distances into the wall-rock. Frequently there will be a 'horse' of unreplaced basalt adjacent to the dike, or silicification may be poorer at the contact of the dike than a few feet away. In veins I, II, III, and IV brecciation is prominent in the upper portions of the basalt. In veins I and II the brecciated walls have been thoroughly replaced by silica and the open spaces cemented with chalcedony, quartz, and sulphides. In veins III and IV the brecciated boulders of basalt are often largely unreplaced, although in the ore-producing portions of the zone the silicification and cementation of the brecciated boulders is as complete as in veins I and II. On the 600 and 700-ft. levels of vein II the basalt has been thoroughly silicified and evidences of brecciation are rare. Here, however, veinlets of bluish-black quartz are found along small fractures, producing a banded effect. Rich ore has been found in this type of vein. The ore often is found frozen to the contact of the dike. When the pyrite occurs in coarse crystals, or when it is whitish in color the ore is usually lean in gold. When the pyrite is associated with a sooty-black powder, a mixture of chalcocite and manganese di-oxide, the gold content is usually from 2 to 6 oz. per ton. The veins are all very spotty. The upper portions of veins I, II, and III, though spotty, consisted entirely of ore. Some large pockets yielded large amounts of ore containing from 10 to 50 oz. gold per ton, the average being about 3 ounces.

Barite is often associated with high-grade streaks of ore. In a few rare cases, calaverite was found occurring adjacent to a small seam of barite; tellurides, however, are seldom found. Secondary sulphides can usually be recognized by the fact that they replace the wall-rock, whereas the primary sulphides are confined to cracks and openings. When the vein is in the trachyte no brecciation exists. The ore is found only along slips, fractures,

and cracks associated with limonite, stained kaolin, or milky-quartz derived by silicification of the trachyte. Propylitization of the basalt is prominent where the basalt is in contact with the dike, the basalt assuming a dull greenish color due to the presence of chlorite, derived by alteration of the ferro-magnesian silicates; pyrite crystals are also developed. From this type, should alteration have advanced further, barren veins of imperfectly silicified material containing streaks of heavy barren secondary sulphide are developed. Some rich ore has been found associated with 'horses' of basalt that have suffered this type of alteration, notably on the 500 and 600-ft. levels of vein II, but where the contact is removed from the known ore-zones, this type of mineralization proves barren. These features of the vein structure point to deposition from hot ascending solutions within the fractured zone, where the pressure was suddenly reduced. Since the primary ore was deposited veins of barren secondary sulphide have been formed, with the development of some ore-shoots, probably by the migration and deposition of some of the gold present in the primary ore.

In many portions of the mine slickensides, striated gouges, and brecciation are present. By careful mapping and extensive development it was satisfactorily demonstrated that, though evidence of faulting was pronounced, it was of minor consequence. In several instances post-mineral faulting could be measured. Nowhere was it more than three feet, and usually less than one foot. Most of the fault-planes were curved surfaces, or consisted of small cracks that extended only a short distance and were then intercepted by another similar fracture. The heavy gouges were usually the result of kaolinization and sericitization of the feldspars by the action of descending sulphuric acid waters rather than of movement and friction. Slight movements are to be expected in a region of such recent volcanic activity. Occasionally slight tremors are still felt. Four years ago an earthquake developed a distinct fracture on the surface of the hillside above the mine. Consequently the striae and slickensides may be due to settling of the rocks to restore equilibrium in sympathy with an eruption from one of the relatively nearby active volcanoes. In vein VI several of the fractures have off-sets of as much as 20 ft. The distinction between faulting and fracturing during cooling, because of torsional stresses, must be recognized. These fractures were formed before the ore was deposited, but even so they make mining difficult.

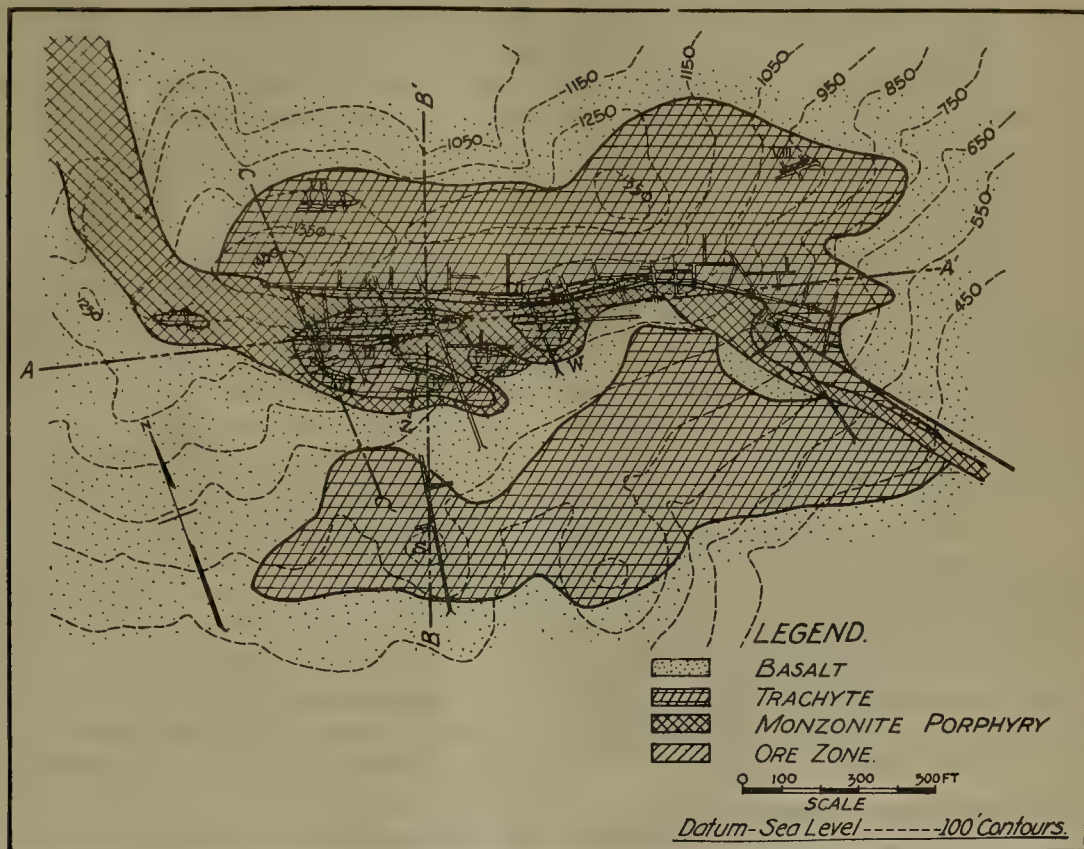

It was noted that rich ore-shoots were found in the upper portions of the zones of secondary sulphide, and that free gold was often visible in such form as to be suggestive of secondary origin.

Samples of water were collected from various portions of the mine, and each was tested to determine the state of oxidation of the iron, the presence of chlorides, and free sulphuric acid. On a composite sample a complete qualitative analysis was made. The water contained mostly basic iron sulphate, also some ferric and some

ferrous sulphate, free sulphuric acid and chlorides. The following elements were also determined: copper, manganese, zinc, nickel, calcium, barium, and magnesium. The surface waters contained a little ferrous sulphate and free sulphuric acid, after it had migrated a short

depth, that is, the oxidation of the pyrite had commenced but had not been carried to a point sufficient to form ferric sulphate. A sample near the west end of the 300-ft. level contained both ferric and ferrous sulphates, a little copper and free sulphuric acid; samples from

AERIAL GEOLOGY: SAN SEBASTIAN MINE

GEOLOGICAL SECTION ON CC': SAN SEBASTIAN MINE

the 400 and 500-ft. levels were extremely acid and contained an abundance of both states of iron and copper: samples from the 600-ft. level showed more ferrous sulphate, less copper and less free sulphuric acid; the same tendency was exhibited by the waters from the 700-ft. level. A spring issuing from the 800-ft. level that was not contaminated by the seepage from above showed only ferrous iron; while copper, ferric iron, and free  $H_2SO_4$  were absent. Unfortunately the tests were not quantitative. The presence of the free  $H_2SO_4$ , manganese and chlorides are of paramount importance. These provide solvents for gold. Ferric sulphate is also a solvent, but only in the presence of the manganese and chlorides, while ferrous sulphate and pyrite, as well as other metallic sulphides, are effective precipitants of gold. Judging from the nature of the free gold and its occurrence in several rich pockets on this zone, it is evidently of secondary origin. Specimens polished and examined under a microscope showed small flakes or films on basalt, also associated with the blue-black quartz, or coating the chalcocite and sulphides. In a few instances small vugs containing probably a small quantity of high-grade ore showed comparatively coarse gold intergrown with chalcocite, pyrolusite and pyrite, mixed with minute crystals of quartz, barite, and pulverulent calcite. Gypsum was also frequently present. In the upper levels some copper sulphides and manganese oxides are found. The ores from pockets on the 600 and 700-ft. levels contain more copper than those on the upper levels. Coatings on the abandoned stope-walls of the upper levels show an abundance of chalcantinite, whereas melanterite prevails in the lower levels except in the region of the rich pockets where frequently brochantite occurs together with melanterite.

The ground-water level slopes with the pitch of the basalt-floor. In the western extremity of the deposit sulphides appear at an elevation of 1100 ft., 50 ft. above the 100-ft. level, but in the extreme eastern end the oxidized zone extends within a few feet of the 500-ft. level. At ground-water the ore shows marked enrichment, increasing from two to six times above the gold-content in the oxidized zone. Erosion has removed a considerable portion of the ore-zones, yet no placers have ever been found. The trachyte on this area is exceedingly resistant to weathering and erosion. It undergoes silicification of the groundmass and surficial coloration due to limonite and hematite in the outcrop. Immense talus slopes have developed, and portions have been scattered by the torrential rains. This has developed the abnormally steep slopes so suggestive of faulting. The outcrop was similarly eroded. Before the mine was developed thousands of tons of rich float was gathered and milled. The basalt weathers easily and forms a dark red soil; the monzonite in weathering crumbles to a loose granular soil. The feldspar kaolinizes and often assumes a color similar to the basalt.

The gold in the deposit is intimately associated with the pyrite. In the oxidized zone some of the gold is liberated and can be panned. This is not a safe guide,

however, since much of the rich ore will not show free gold. Failure to appreciate this resulted in filling many of the old stopes with ore. Subsequent milling of a number of these fills produced considerable 1 to 2-oz. ore. Owing to the extremely erratic distribution of the gold assaying must be relied upon entirely. Silver is never determined because it is present in only very small amount, the gold-silver ratio being about 10 to 1 in weight. The tailing from the mill contains approximately 0.1 oz. gold regardless of the value of the heading assay. Gold telluride has occasionally been found, but even when the ore is roasted prior to cyaniding, the tailing still contains about 0.1 oz. gold. Excessively fine grinding and prolonged contact with cyanide has helped only slightly. Other minerals of minor importance occurring in the deposit are: tetrahedrite, chalcopyrite, bornite, chalcocite, calaverite, molybdenite, rickardite, marcasite, pyrrhotite, pyrolusite, barite, gypsum, chalcantinite, brochantite, melanterite, and amygdaloidal cavities filled with zeolites such as natrolite, thomsonite, quartz and epidote, with some calcite.

Slides of the basalt from different parts of the mine show olivine, basalt, porphyrite, and augitite. Differences are noted in texture, composition, and color of the basalt at various points, but from their structural relations they are evidently all members of the same flow. The texture of the fresh basalt is compact and fine ophitic texture of the feldspars and the augite is occasionally developed; it is sometimes veined and brecciated, and alteration has produced many secondary minerals. An important alteration of the basalt by contact-metamorphism is found throughout the property. For convenience it has been called locally the 'fine-grained dike.' It varies from a coarse rock resembling the monzonite to a highly silicified rock containing visible striated plagioclase crystals and some scattered flakes of biotite. In a few places it was possible to trace its gradation into fresh basalt. The trachyte consists essentially of orthoclase, biotite, and hornblende in a devitrified groundmass. The biotite and hornblende are not usually visible to the eye; flow-structure is apparent; the texture is uniformly fine-grained and smooth; limonite and hematite stains are prominent, and in the ore-zones the typical silicification of the groundmass is universal. The quartz-monzonite porphyry has a coarsely granitoid texture and hypidiomorphic crystals are well developed, yet there is ample evidence that it was formed close to the surface. In places where it was intruded into fissures through the basalt, glassy boundaries are found. Even in thin sills its texture is coarse-grained. It is locally called the 'granitoid dike.' Just north of the extreme western end of ore-zones I and III at the surface, a small area is found in which the texture is coarsely porphyritic in a stony groundmass not unlike the trachyte, containing sanadine, quartz and biotite in large crystals. The mineralogical composition of the rock is essentially orthoclase, plagioclase, quartz, biotite, hornblende, and magnetite. In the lower portions of the mine, quartz is less abundant and plagioclase predominates, the rock approaching dior-

ite in composition. Such segregations are not uncommon. These features, together with the character of the fracturing, led me to believe that the dike was intruded into the trachyte before it solidified and that its lower portion occupies the throat of the volcano from which the trachyte was ejected. Formerly it was supposed that the dike was intruded along the southern edge of the trachyte plug, but numerous cross-cuts have shown that there is no trachyte plug. All cross-cuts on the lower levels on all sides of the dike have found basalt. Along the contact the dike is frequently kaolinized and sericitized. The trend of the underground circulation is toward the dike. The acidulated waters thus circulating have brought this alteration.

The genetic relationship of the ore deposit to the intrusion of the dike is evident. By referring to the accompanying maps it will be noted that ore-zones I and II; III, IV, and V occur on opposite sides of the different

level, and by two cross-cuts to the south through the dike from the 400 and 500-ft. levels and by two drifts around the western end of the dike. In each case only a propylitized basalt contact-zone was found. Areas W and Z were investigated with like results. A little ore was obtained in these regions but never enough to warrant consideration. In area S a small amount of ore was taken from the summit of the hill, and a long tunnel was then driven along the basalt-trachyte contact, but only heavy barren secondary sulphides were found. The bulk of the ore may have been eroded.

This unique deposit has produced about \$15,000,000. There are eight main levels with an elaborate system of intermediate workings. Only one shaft is used in order to hoist ore from the 700 and 800 to the 600-ft. level, at which elevation the mill is situated. There is an 1800-ft. drainage tunnel 30 ft. below the 800-ft. level. Before this was completed the pumping costs were enormous because

GEOLOGICAL SECTION ON AA': SAN SEBASTIAN MINE

branches of the monzonite dike. It is reasonable to suspect the possibility of ore existing under conditions of similar structure, such as at X, on the north side of the dike; at Z and W, under the flat-lying dike; at Y, on the south side of the dike, and at S, (section on B-B') should the flat-lying dike at Z have extended over this hill. Area X has been explored by four cross-cuts through the dike, two from the 200-ft. level, one from the 100-ft., and the other from a point 200 ft. above the 100-ft. level. One cross-cut from the 200-ft. level entered basalt, but all of the others revealed a large well silicified and somewhat brecciated vein, mineralized only with barren sulphides. It is interesting to note that sulphides are found in the upper cross-cut, at a point 150 ft. higher than the level of sulphides on the south side of the dike in the ore-zones I and III. Since the outcrop of this vein is indistinct and has yielded no payable ore, it is apparent that this is a barren vein and probably was formed by surface waters which derived their silica and iron from the trachyte. The water circulating along this side of the dike is drinkable, in this respect differing from that coming from the known ore-zones. Area Y was explored by a long drift along the south side of the dike on the 300-ft.

of the acid water. Because of its erratic character the deposit is peculiarly well adapted to being worked by the cheap, though inefficient, native labor. Seams are followed with careful and frequent sampling. The stringers often widen to an ore-shoot. If the ore-shoot proves large a raise is driven with a machine-drill, but if, as is more often the case, small, the ore is then stoped by hand and removed by 'tenateros,' that is, boys who carry the ore in raw-hide bags, holding about 40 lb. In the broader veins the ore is broken by machine-stoppers. In the vicinity of old fills the temperature is excruciatingly hot, hence it is necessary to make numerous underground connections to provide for ventilation. An attempt to estimate the ore-reserves is impossible. From the experience of past years a unique method has been developed. Each month the mine foreman and engineer hold a consultation, and by referring to the stope records of the past month and from their knowledge of conditions, they forecast the amount of ore in each stope, aiming to keep three months ore-reserve available. The object of making the estimate is to obtain a figure for the monthly reports, showing the probabilities. About 2000 ft. of development work is performed each month. On the basis of 3500

tons stoped and milled, and an equal amount developed, it is easy to see that the deposit is exceedingly erratic. Development is pushed at about 100 working faces. The superintendent, Gustave Scogland, well expressed it: "We get a hat-full of ore here and another there, and by beating the kids on the back we manage to keep the bins full." Although at this writing the end would seem to be in sight, the life of the mine will undoubtedly exceed all estimates. In the process of robbing the known pillars of ore new streaks may be disclosed. Though there are approximately 30 miles of underground workings, no one can say with certainty when the mine will be worked out.

## Mineral Output of Idaho

The value of the output in 1916 was \$48,767,783. The shipments in the first six months of 1917 from the Coeur d'Alene region, which give an idea of conditions in Idaho, were at the rate of the previous year, which was nearly 44,000 tons of crude ore and concentrate per month. Greatly increased output from the Hercules, Hecla, Morning, and Bunker Hill mines have balanced decreases in the Tamarack & Custer, Stewart, and Last Chance. At the same time the Bunker Hill custom-smelter at Kellogg is nearing completion, and the first ore has been shipped to this new lead plant. The plant at Northport, Washington, continues to treat the lead-product of the Hercules mine at Burke, in addition to custom material. In 1916 the value of the gold produced, coming largely from Boise, Elmore, Idaho, and Lemhi counties, amounted to \$1,115,810. There was a decrease in the output of gold and from placers, and an increase from deep mines. Operations at Atlanta, in Elmore county, and at Burgdorf, in Idaho county, are adding to the gold production. The output of silver last year was 12,300,873 oz., valued at \$8,093,974. Shoshone county supplied the greater part, and mines at Gilmore, in Lemhi county, and Mackay, in Custer county, constituted most of the remainder. If the present rate of shipment of ore continues, this quantity may be exceeded in 1917, and the value will be greater, as the average price of silver increased from 65.8c. in 1916 to about 75c. in the first part of 1917. The Hercules mine at Burke is by far the largest producer of silver in the State, the gross value of the silver and lead output in 1916 having been \$7,278,258. The Hecla, Hercules, Morning, Bunker Hill, Caledonia, and Greenhill-Cleveland produced nearly 75% of the total silver in 1916, and the first three mines are making heavier shipments this year. The copper output in 1916 was 8,478,281 lb., valued at \$2,085,657. Over 65% came from Custer county, largely from the Empire property. In Shoshone county, the Caledonia, Richmond, Horst Powell, and National produced copper ore and concentrate. In 1917 the Richmond is becoming a large shipper. In Custer county, activity in the Alder Creek district is notable. The Copper Basin has become a good producer and the Empire is being opened for greater

production from the lower tunnel. The output of lead in 1916 was 375,081,781 lb., valued at \$25,880,643. This rate has been sustained during the first half of 1917, and, with a better price and a new lead smelter, the shipments may be increased toward the end of the year. The Hercules has materially augmented shipments. The monthly average of crude ore and concentrate in 1916 was over 7200 tons. In Lemhi county, which produced 11,208,985 lb. of lead in 1916, the shipments in the early part of 1917 were less, but at the Idaho Continental, in Boundary county, they increased. The Homestake-Copper Queen property, near Mackay, has become an important lead producer, and the Blue Bird mine, at Clayton, is to have a concentration mill. The shipments of zinc and lead-zinc ore and concentrate in 1916 contained 86,505,219 lb. of recoverable spelter. An average of about 10,000 tons per month of crude ore and concentrate was shipped. Most of the zinc is from the Consolidated Interstate Callahan mine at Sunset. In the first quarter of 1917, 13,839 tons of zinc ore and concentrate, containing 12,614,475 lb. of zinc, was shipped. This is slightly less than the quarterly average for 1916. The shipments from the Greenhill-Cleveland and Frisco were less, but the Morning, Success, Highland Surprise, Douglas, Rex, and Hercules made the usual contributions. In 1917 the Hecla and Ray Jefferson joined the ranks of the zinc shippers.

THE U. S. Geological Survey is planning to make the desert regions of the western part of the United States more accessible by locating their widely separated watering-places and erecting hundreds of sign-posts to give directions and distances to the watering-places. The project involves also the work of making accurate maps showing the locations of the watering-places, of preparing guides describing them and giving the distances between them, of selecting well-sites, and of developing watering-places (so far as money available will permit) in localities where water is most needed and where the geologic investigations indicate that underground supplies can be obtained. It is expected that this work will help to expedite the discovery and development of the rich mineral deposits in parts of these regions. It will also be valuable in other respects.

FLUORSPAR is a mineral that has not attracted the attention of the Western miner and for obvious reasons, nevertheless, deposits may be discovered. Its importance can be appreciated by the fact that in 1916, 133,651 short tons of 'gravel spar' was produced. The average prices per ton received at the mine were \$5.34 for gravel, \$7.94 for lump, and \$12.38 for ground. The increased demand for fluorspar has come largely from the manufacturers of open-hearth steel, who use the mineral as a flux, but the demand for it in other metallurgic operations and for the manufacture of hydrofluoric acid has been very active. One of the newer uses for fluorspar is as a reagent in the recovery of potash from feldspar and from portland cement clinker.

# Soluble Frothing-Agents

By C. L. PERKINS

There is a great deal of misunderstanding as to the solubility of many of the oils used in flotation. This may be due in part to confusion of the terms 'solubility' and 'miscibility.' If an oil does not apparently mix with water, this is not necessarily an indication of absolute insolubility. It might be well to emphasize the fact that there are widely varying degrees of solubility. Even though a substance dissolves in water only in the proportion of 1 part in 10,000 parts, it is soluble from the point of view of the chemist, and in all the chemist's work with that substance its solubility is taken into account. The flotation engineer and experimenter must learn to look upon solubility in the same way, for it is precisely these slight degrees of solubility which often determine the success or failure of flotation.

An interesting case in point is found in U. S. Patent No. 962,678. Among the soluble frothing-agents mentioned in the claims of this patent are phenol and its homologues. The statement is made that all previous processes of flotation have employed oils which were immiscible in water. Reference is also made to Patent No. 777,274, in which phenol, cresol (a homologue of phenol), and others, are said to be liberated in an insoluble condition in the pulp by the addition of their alkaline compounds to an acid pulp. It is, of course, absurd to consider phenol and cresol as being soluble in one case and insoluble in the other. As a matter of fact, phenol is soluble in the proportion of about 6 grammes in 100 gm. of cold water and much more so in hot water. Cresol is soluble to a much smaller degree, but is completely soluble within the limits practically used in flotation. The figures for the solubility of cresol are variously given as from 0.3 gm. in 100 gm. of water to 3 gm. in 100 gm. Assuming the smaller value, and a 3:1 flotation-pulp, this would mean that cresol might be used in the proportion of 18 lb. per ton of ore and still be entirely in solution.

A recent writer, in commenting upon the decision of the Court in the Miami appeal case, states that the purer grade of pine-oil and creosote are insoluble. Pine-oil is, of course, of varying composition, dependent upon the details of distillation. The refined product, however, still contains soluble substances, being a hydrocarbon complex and hence containing compounds of different properties. The term 'creosote' is loosely used. The chemical composition of creosote obtained from wood is widely different from that of the coal-tar product. The U. S. Pharmacopoeia classes wood-creosote as "slightly soluble." Coal-tar creosote also contains appreciable amounts of soluble material.

According to Mueller,\* cresol, or cresylic acid, was

formerly the favorite oil for the flotation of copper ores in this country. Its use became less general only as the material became more expensive, and it was found by experiment that cheaper oils and oil mixtures could be substituted for it. The oils replacing it were mainly wood-creosote, coal-tar creosote, and coal-tar itself. The soluble portions of these oils, which are the constituents responsible for their frothing power, are largely cresol and other phenols. In view of the fact that the froths obtained throughout all flotation practice have been largely dependent for their production upon soluble material, and that at least one of the oils extensively used in the beginning was completely soluble in the proportions employed, it is idle to speak of soluble frothing-agents as a distinct class and it is unjustifiable to claim their use as a broad new discovery.

The action of various flotation-oils in producing froth has been discussed by several writers in this journal and elsewhere. Coghill,<sup>1</sup> Hildebrand,<sup>2</sup> and Corliss and Perkins<sup>3</sup> have outlined the considerations governing the formation of a stable froth. Nevertheless, it is apparent, from statements appearing from time to time in the literature of the subject, that the principles involved are still not fully understood by many of those interested in the art of flotation. As the matter is one of considerable importance, especially in connection with the patent situation, it is perhaps worth while to re-state the necessary conditions for the formation of a froth, in order to emphasize the fact that all frothing-agents are to some extent soluble.

The first requisite for a froth is variable surface-tension on the part of the liquid films surrounding the air. In other words, the material of the film must be such that the tension of a freshly-formed surface will differ from that of an older surface. This principle was recognized by Rayleigh,<sup>4</sup> who demonstrated the fact that adsorption requires time for its completion. In working with solutions of saponine he found differences between the tension of freshly formed surfaces and that of slightly older surfaces. These differences were of considerable magnitude and easily susceptible of measurement. The bearing which this fact has upon the stability of a froth is explained as follows:

If a bubble-film starts to thin out, due to the liquid of which it is composed draining away by its own weight, or if it is subjected at any point to a strain or a blow

which would tend to rupture it, a new surface is automatically produced at that point. The new surface always has a higher surface-tension than the old one, and the result is that the tendency to rupture is resisted. The higher tension of the new surface is immediately equalized by diffusion from within and from adjacent portions of the film. This process is continually going on in a stable film. It is a well known fact that pure liquids will not froth. If low surface-tension were enough in itself to cause a stable froth, many of the pure oils as well as other organic liquids would froth. In order to obtain a froth, it is necessary to add some substance that will produce variable surface-tension. Theoretically, a froth should be caused by materials that raise the surface-tension of water and, as a matter of fact, solutions of many inorganic substances do froth slightly. The reason that they are not practicable for use in flotation is the fact that the differences in surface-tension produced by them are only slight. On the other hand, many of the substances that lower the surface-tension of water do so to a marked extent.

Only materials in solution can impart variable surface-tension to water, because only such materials can diffuse through water with the necessary rapidity. Insoluble oils cannot do so. If they are present in the water in sufficient quantity, they may form films of molecular thickness between the air of the bubble and the surrounding water. Such films are, however, lacking in stability. Colloidal material or other very small solid particles may increase the stability of a froth in several ways. They may serve as points of support for the bubble-films. If the particles are sufficiently closely packed, the friction of one against another may increase the viscosity of the liquid to such an extent that the tendency toward thinning by drainage is greatly decreased. Finally, they may prevent coalescence of the bubbles in the same way that similar materials stabilize an emulsion, that is, by forming an envelope or sac about them, preventing actual contact of one bubble with another.

zero is \$75. By using the ratio in the table and applying it to this amount the depreciation for any period can be determined.

## Depreciation Tables

The accompanying tables, taken from the final report of the Committee on Valuation of the American Society of Civil Engineers give the amount to be allowed for depreciation for different lives and interest rates under the so-called compound-interest or equal-annual-payment method. Thus, for an article valued at \$100, having a 20-year life, no salvage value, and interest at 5%, the allowance for depreciation for the first year is \$3.02; the allowance for interest is \$5, making the total for interest and depreciation, \$8.02; the second year the depreciation is \$3.18 and the interest on the depreciated value of \$96.98 is \$4.84; making a total of \$8.02 as before. The tables can also be used for articles having a salvage-value at the end of their useful life. Thus assume the original value to be \$100, the salvage value \$25, and the useful life 10 years. The amount of value which depreciates to

# Seale-Shellshear Flotation Apparatus

In the discussion of flotation as practised in Australia frequent mention is made of the Seale-Shellshear apparatus, but no statement of the details has been published in the technical journals. Accordingly we reproduce from the original patent papers the inventors' description, with drawings from the patent specification. The British patent is No. 10,666, and the date claimed, in accordance with the patent office regulations, is July 30, 1914. The inventors are Harry Vernon Seale and Wilton Shellshear, both of Junction North Mine, Broken Hill. In their preamble they affirm that the invention is specially applicable to "froth-flotation in which ores are subjected to aeration in an aqueous separating medium in the presence of a frothing-agent for the formation of a froth or scum of metalliferous particles . . . as described in prior patents No. 7803 (1905), 2359 (1909), and 21,857 (1910). The specification follows:

"Hitherto the aeration or emulsification of the pulp has been effected by vigorous agitation by means of rotating stirrers, impellers or beaters or by means of centrifugal pumps the driving of which involves the consumption of a considerable amount of power. It has also been proposed in the concentration of ores to pass the ore mixed with water and a frothing-agent through a U-tube so that at the inlet thereof the pulp sucks in air, which as the pulp descends to the bend of the U-tube becomes dissolved and on rising in the other limb of the U-tube again comes out of solution and attaches itself to the metalliferous particles in the ore. From the U-tube the mixture is discharged into a flotation vessel where the froth floats and is separated. It has also been proposed to mix the powdered ore with water and pass it to a hopper arranged with its lower end beneath the surface of liquid in a spitzkasten, a steam-injector being arranged in the said hopper and having means for the injection of oil and air to the steam-jet whereby the pulp is forced into the spitzkasten and is thoroughly agitated with the air drawn in by the steam, and whereby a froth is formed which is floated and separated.

"The object of the present invention is to provide improved means for the aeration or emulsification of the pulp for the formation of the froth or scum in a thoroughly efficient manner with a great saving in the consumption of power. According to the present invention in the concentration of ores by flotation separation the ore-pulp is fed or delivered into the open top of a pipe or tube projecting beneath the surface of the liquid in the separating-box or vessel with such a flow of material within the said pipe or tube as to ensure the entrapping of the air necessary for the aeration of the pulp by the flow of the material itself.

"In apparatus for carrying out this process for the

concentration of ores by flotation separation, there is combined with a separating-box or vessel having a residues-outflow at the bottom, a feed-box open at the top, having an inflow-pipe at the side thereof and a discharge-pipe at the bottom delivering into the said separating-box or vessel below the surface of the liquid,

FACSIMILE OF DRAWING IN PATENT

with such a flow of material within the said pipe or tube as to ensure the entrapping of the air necessary for the aeration of the pulp by the flow of the material itself.

"A number of separating-boxes and a number of feed-boxes may be arranged in series one above the other, each separating box having a residue outflow at the bottom leading to a feed-box, and each feed-box having a discharge-pipe at the bottom delivering to the next suc-

ceeding separating-box or vessel below the surface of the liquid therein."

Fig. 1 shows the arrangement of the plant with a number of separating-vessels in series; Fig. 2 is a vertical section of a single separating-vessel with a feeding-device; and Fig. 3 represents a modification of the arrangement for effecting the purposes of the invention.

"Each separating-unit preferably comprises a separating-box *A* and a feed-box *B*. These feed-boxes *B* are open at the top and are also of any convenient shape, but we have found that square shape in cross-section well answers the purpose. Each feed-box *B* is furnished with a depending feed-pipe *B*<sup>1</sup>, which delivers into the separating-box *A* below the level of the pulp or separating medium therein. The feed-pipe *B*<sup>1</sup> delivers onto a baffle *A*<sup>1</sup> arranged within the separating-box *A*. Each separating-box *A* is provided with launder *A*<sup>2</sup> for the float concentrates and a circular baffle *A*<sup>3</sup> surrounding the feed pipe *B*<sup>1</sup> for the purpose of maintaining a state of quiescence on the surface of the pulp in the separating-vessel *A*. The vessel *A* is also furnished with an outflow *A*<sup>4</sup> for the unfloat residues which is provided with a removable annular plug or ring whereby the size of the same may be regulated. Leading from the outflow *A*<sup>4</sup> is a pipe or duct *C*, which discharges into the next feed-box *B* of the series. A main water pipe *D* is provided, having taps or faucets *D*<sup>1</sup> adapted to discharge into the feed-boxes *B* whereby the level therein may be adjusted and compensation made for losses occasioned by the withdrawal of concentrates. A common feed-box or vessel *E* may be provided at the head of the series for the purpose of equalizing the feed so as to ensure a regular flow to the machine.

"In operation the pulp is fed from the equalizing-feed box *E* into the first open feed-box *B*, whence it flows by the feed-pipe *B*<sup>1</sup> into the separating-box or vessel *A*, being delivered under the surface of the liquid striking the baffle *A*<sup>1</sup>. The float concentrates rise and overflow into the launder *A*<sup>2</sup> while the unfloat residues flow out through the hollow plug *A*<sup>4</sup> and the pipe or duct *C* to the next feed-box *B* in the series, and so on. The feed-boxes *B* are open at the top and the flow of material thereinto by the pipe *C* causes a vigorous agitation. The outflow through the pipes or tubes *B*<sup>1</sup> from the feed-boxes *B* has a slight excess capacity over the flow of material there-through so that a vortex or swirling action is set up which entraps air within the said pipes or tubes *B*<sup>1</sup> by the flow of material itself thereby ensuring the requisite aeration necessary for the thorough emulsification of the pulp to effect flotation. The head or height of the feed-box *B* above the separating-box *A* is such as to regulate the flow of material to ensure the aforesaid entrapping of air. The pulp with its entrapped air discharges immediately on the baffle-plate *A*<sup>1</sup> by which thorough emulsification is ensured. The outflow through the hollow plugs *A*<sup>4</sup> is controlled and regulated by adjusting the size thereof so that by having a series of hollow plugs *A*<sup>4</sup> of definite constant size the whole of the plant is self-

regulating providing the equalizing-feed box *E* at the top is kept at a constant level or other means adopted for maintaining a constant feed. Water or aqueous separating medium is added in the various feed-boxes *B* by the taps or faucets *D*<sup>1</sup> to compensate for that removed with the float-concentrates and maintain a constant level within the separating-boxes *A*. This may be effected by varying the size of the outflow-orifices in the hollow plugs *A*<sup>4</sup>.

"The flotation circuit-liquor which may be hot, is prepared from any water that is readily available, such as underground water, mill circuit-water, or fresh supply-water. A frothing-agent, such for example as eucalyptus oil, is added immediately after the liquor is removed from the residues, when circuit-water is employed, and before it enters the suction of the return-pump which delivers the liquor to the storage-tank. In this way the oil is well agitated with the water by the pump. It is to be understood, however, that the frothing-agent may be added at any stage of the process, for example it may be added to any of the mixing-boxes *B*. Similarly any acid required in the flotation circuit may be added at any stage of the process as desired. If a further quantity of frothing-agent or acid is required at an intermediate stage of the process, the material from the flotation vessels may be run into a tank where the agents may be added, from which tank it is then passed to a second series of mixing-boxes and flotation-vessels."

BARYTES was produced to the amount of 221,952 tons in 1916, the average price being \$4.56 per ton. The leading producing State was Georgia, with an output of 401,295 tons, followed closely by Missouri, with 365,111 tons. The domestic production of barium chemicals in 1916 increased 90% over that in 1915, which was the first year in which a considerable quantity of barium chemicals was made in the United States. The production of ground barytes increased 27% and that of lithopone approximately 10%. White bleached and floated barytes is used in ready-mixed paints and in the rubber and paper industries. Off-color ground barytes is used in preparing colored mixed paints and in several chemical industries. Lithopone is used principally in making rubber goods and as a pigment in 'flat' wall-paints. It is also used in making linoleum, calcimine, and paper. The barium chemicals have many uses, the largest consumption being that of barium binocide in the preparation of hydrogen peroxide.

SCIENTIFIC RESEARCH on a large scale is being undertaken in Japan, involving the establishment of a great laboratory in Tokio, which has been voted a credit of 2,000,000 yen by the Parliament, in addition to a sum of 2,900,000 yen subscribed by private individuals, and another sum of 1,000,000 yen donated by the Emperor. These funds are to be available in ten annual installments, thus making 590,000 yen or approximately \$294,000 per annum.

## Precipitating Gold From Coppery Cyanide Solution

By ROBERT LINDSAY

\*Cyanide solutions containing copper deposit this metal readily on clean zinc; the copper forms a closely adherent metallic film or plating, which after a time coats the zinc so completely that the precipitation of gold almost ceases, and here the lead-zinc couple is used with advantage for cupriferous solutions. Lead-coated zinc does not precipitate copper so readily from working solutions as clean zinc, and the object aimed at is not to precipitate all the copper, but to keep the amount of copper in solution more or less constant. If the lead coating be too light, too much copper will be thrown down, and more zinc will have to be added to the extractors before the clean-up, resulting in an unnecessarily high consumption of zinc. The practice in dipping is to regulate the quantity of zinc dipped with the strength of the lead-solution so that each 100 lb. of zinc will carry 5 lb. metallic lead. That suits the copper content of the solution here and precipitates about one-half of the copper entering the extractors, while the gold content of the effluent is seldom above 0.03 dwt. even in the cold season. Increasing the cyanide strength as a remedy for bad precipitation is not recommended. It gives temporary relief, no doubt, by keeping copper in solution, but the gradual accumulation of copper in solution detrimentally affects the recovery, and the excess of copper has to be got rid of eventually, either by precipitation or by running some of the solution to waste.

If the soluble copper in the ore should become abnormally high, it will be found advantageous to have uncoated zinc in the first compartment to precipitate a proportionally large amount of copper, leaving the remaining compartments of lead-coated zinc to precipitate the gold and a portion of the remaining copper. The first compartment of coppery zinc is taken out every 4 or 5 days and immersed in dilute acid for a few minutes, and returned to the box along with some new zinc to fill the compartment. There is an increase in zinc consumption, but the gold precipitation is good. The precipitation of copper on zinc is, of course, accompanied by a regeneration of cyanide, thus:

or

consequently the cyanide strength leaving the extractor box is always higher than that entering it, as shown in the accompanying table.

The tendency of the copper to remain in the stronger

	Sand boxes			Slime boxes		
	KCN, %	CaO, %	Copper, lb. per ton	KCN, %	CaO, %	Copper, lb. per ton
Entering .....	0.032	0.007	0.12	0.022	0.008	0.09
After 1st compt..	0.039	0.008	0.11	0.025	0.011	0.07
After 2nd compt..	0.044	0.009	0.08	0.028	0.010	0.05
After 3rd compt..	0.042	0.010	...	0.029	0.010	...
After 4th compt..	0.040	0.010	...	0.028	0.011	...
After 5th compt..	0.039	0.011	0.07	0.028	0.011	0.04

solution of the sand boxes will be noted, the precipitated copper there being 41.7% as against 44.4% in the case of the weaker cyanide solution of the slime boxes with a lower copper content on entering. One cubic foot of zinc is allowed per ton of solution per 24 hours. The clean-up takes place twice each month. The top compartment only of each box is taken out, and is treated as usual with sulphuric acid. Bisulphate is not used on account of difficulty of transport and inconvenience in handling, the mine being about ten miles from the nearest railway station at Graskop. When all the zinc has been dissolved, the copper is attacked by nitric acid, or with sulphuric and nitric acids together, which is cheaper than nitric acid alone, thus: With nitric acid only

189 + 504 @ 1 shilling per lb.

= 504s. = £25 4s. for 189 lb. of copper.

With sulphuric and nitric acids

189 + 294 + 126 = 62s. + 126s. = £9 8s. for 189 lb. of copper.

Over 700 lb. of copper is thus dissolved at every clean-up. The acids are added in the proportion of 1 part sulphuric to 0.44 part nitric acid, and the temperature should not be under 60° C. if copper is to be kept out of the bullion. The precipitate, kept in suspension by mechanical stirrers, is tested for the presence of copper after each addition of acid, so as to ensure no more acid being added than is absolutely necessary. When the copper is all in solution the vat is filled with water and a few pounds of size added to assist settlement, which usually takes place in five or six hours. The solution containing the zinc and copper is passed through a sand-filter to catch any fine gold-slime in suspension. The surface of the vat is skimmed every other month and the sand used as flux. The solution now flows through a stoneware pipe to two copper precipitating vats, which are filled with scrap-iron. Any old iron is put into these, fire-bars, fire-doors, worn-out plates, or battery screening. Every four months the vats are completely cleaned and the precipitate screened to keep out coarse iron. It is air-dried, thoroughly mixed, sampled, assayed, and sacked in sugar pockets at a cost of 25s. per ton. The following are the details of a parcel of this copper precipitate sent to England last July, and on which a net profit of £600 was realized:

\*Abstract: 'Notes on Treatment of Pilgrim's Rest Ore'; Jour. Chem., Met. & Min. Soc. of South Africa, April 1917.

Dry weight, tons	Assay per ton			Total content		
	Au, oz.	Ag, oz.	Cu, %	Au, oz.	Ag, oz.	Cu, tons
8.171	10.99	123.79	40.95	89,802	1011,550	3.346

There is no gold or silver in the copper vat effluent, and only a trace of copper toward the end of the run. It is found that coarse iron gives a much purer product, and by using that exclusively it is hoped to bring the precipitate up to over 60% grade. The copper recovered is equal to 0.13 lb. per ton milled, and agrees fairly closely with the difference between the copper content of original and residue, and is rather less than one-half of the copper content of the ore for the period. The washed gold-slime is filter-pressed and dried. Calcining is not found necessary after using nitric acid. The gold-slime assays about 30% gold and is fluxed with 25% borax, 12½% sand, and 12½% manganese di-oxide. The bullion averages 850 fine. The average total recovery from the plant is 94%, and the cost 5s. 7d.

## Portable Electric Hoist

The accompanying photograph shows a portable electric hoist that is in almost constant use by the San Antonio Water Co., of Ontario, California. The hoist is composed of the following: a two-horse farm-wagon, upon which a 3 by 10-in. Oregon pine wagon-frame has

PORTABLE HOIST AND DERRICK

been securely bolted. The housing over the rear wheels contains an induction-motor with accessories and sufficient additional space for a belt and necessary tools. A standard two-ton hoist, belted to the induction-motor, is placed immediately back of the front axle. As shown in the photograph, the hoist is in place, its motor wired to the power-line and its hoist-cable passing over a device, ready to be used in removing the pump when the belt is connected. By bolting an 'A-frame' to the two uprights, near the front axle, and placing a detachable boom, the hoist may be used as a portable derrick with a swinging radius of 10 or 12 ft. This hoist has been used with economy for the following purposes; hoisting tunnel-waste and lowering pipe and concrete for lining tunnels; hoisting large rock from pipe-line trenches and lowering pipe to place; moving earth by the drag-line scraper method; sand-pumping of oil wells; setting pumps, pipe,

and machinery at pumping-plants; loading and unloading cars; setting and replacing poles and towers; and performing many minor operations.

## Methods of Construction of Concrete and Timber Flume for Cove Power Project

The Cove flume, which is part of the Cove power project of the Utah Power & Light Co., is described in the *Journal* of the Utah Society of Engineers by L. M. Pharis. The project is on Bear river in southern Idaho.

The flume is unusual on account of its size and the details of construction. It has a clear width inside of 20 ft. The length is 5700 ft. and there is a fall of 2 ft. in this distance. The top of the flume is kept level so that the depth varies from 11½ ft. at the upper end to 13½ ft. at the lower end. This allows the water in the flume to assume the static level without spilling. In addition to this there is a spillway 300 ft. long at the lower end to take care of surges when the turbine-gates are closed suddenly, and a wasteway in the canal-section just below the headgate at the upper end to prevent spilling over the flume in case there is a sudden rise in the pond-level.

Instead of constructing the frames or bents of wood, which would have had a comparatively short life, besides presenting some difficult problems in construction, the sills, posts, and tie-beams are constructed of reinforced concrete. The tie-beams are 10 by 14 in.; the posts are 22 in. wide at the top and 27 in. at the bottom. The sills are 2 ft. wide and both posts and sills are 14 in. thick. Each frame was poured as a monolith and the corners are reinforced. The sills are supported on three concrete piers, each 18 by 36 in. cross-section. The height of the piers varies with the topography, from 6 in. to 15 ft. They are carried below the frost-line and have spread footings where the nature of the ground is such as to require them. The frames are spaced 6 ft. centre to centre. Around the inside of each frame is bolted a nailing-plank 5 by 14 in., to which a wooden lining is spiked. This lining varies in thickness from 3 to 5 in., the bottom and lower part of the side-lining being 5 in. and the remainder of the side-lining being 3 and 4 in. The lining is the best grade of Oregon fir and was shipped to the job slightly over-size in width to allow for shrinkage. The planks were then planed just before placing in the flume. This process made the final cut to exact and uniform width and also cut the groove for the spline.

LITHIUM is a silver-white soft metal which forms the oxide or some other salt on exposure to the air, and which decomposes water, forming the hydroxide of lithium; for these reasons metallic lithium does not occur in nature. The U. S. Geological Survey announces that some chemical products derived from lithium minerals have found application for military purposes.

# Solubility and Orientation of Molecules in Surface of Liquids

\*The structure of the surfaces of liquids, and the relation of solubility to the work done by the attraction of two liquid surfaces as they approach each other, is engaging the attention of physicists more than ever before, due in part to the importance of an understanding of these phenomena in their practical application in flotation. An interesting study of the question was recently contributed to the *Journal of the American Chemical Society* by William D. Harkins, F. E. Brown, and E. C. H. Davies. Their measurements of the work done in ergs per square centimetre when the surface of two liquids come together to form an interface, show in a striking manner that the film of any liquid in contact with water is composed of molecules oriented so that the active (or polar) group at the end of any hydro-carbon chain is in contact with the water. The double bond of an unsaturated hydro-carbon, and the double bonds in the benzene ring act in this respect like polar groups. It is also shown that the attraction between water and another liquid is one of the important factors in the determination of the solubility of the other liquid in water. Imagine a volume of water divided by a horizontal plane parting and lifting the upper portion. Two surfaces now appear. If the temperature be 20° C. the surface-tension would be 72.8 dynes per centimetre, and the free energy per square centimetre would be 72.8 ergs. The total energy of the two surfaces, each with an area of 1 sq. cm., would be 145.6 ergs. Suppose the two surfaces to be again brought into contact and that this free energy disappears; if, however, one of the surfaces be water and the other benzene, the free surface energy of the two would be 72.6 for the water and 28.98 for the benzene, or a total of 101.78 ergs. The decrease of free energy is seen to be 66.7 ergs when they meet, which is equal to the work done by the two liquids as they approach. Therefore the free energy of the 1 sq. cm. of interface is 35 ergs. The amount of work necessary to separate the liquids after their surfaces have come together, is, however, not the same as the decrease as shown above, since the surface-tension of each liquid is affected by the other. Thus, when mutually saturated at 25° C. the free surface-energies become, water 60.19, plus benzene 27.9, total 88.09; the decrease when they come together is 43.41 ergs. It is seen that the relative attractions exerted by a water-surface upon the surfaces of other liquids may be approximately measured. This applies only to liquids that do not mix; it is not possible to determine the interfacial tensions of extremely miscible

liquids, since, in fact, they form no interface. As solubility increases the interfacial tension decreases. For example, the interfacial tension of water with octyl alcohol is only 8.28, with iso-amyl alcohol 4.42, and with iso-butyl it has decreased to 1.76. Therefore it may be affirmed that the interfacial tensions of liquids mutually soluble in all proportions are so small as not materially to affect the calculation of the decrease of free energy.

It is found that if the interfacial tensions between two liquids is small the liquids are miscible. In some cases, however, the surface-tension is not the property that actually determines the solubility of a substance as a molecular disperse system (so-called true solubility); this is shown by the fact that it is possible to make water colloiddally soluble in benzene or benzene in water, commonly called emulsification, by adding a substance which causes the interfacial tension to drop to a low value, but in this way such a substance cannot be made to dissolve in water as a molecular disperse phase, that is to say, a true solution of any considerable concentration with a substance of that kind as a solute cannot be formed. The necessary condition for the formation of a molecularly dispersed solution is that as the particles are made smaller the surface-tension must not increase, and this condition is not met by stable emulsions and colloids. As an example of colloid formation an emulsion of benzene in water may be stabilized by sodium oleate. The interfacial tension is either zero, or very low. If the interfacial surface could be removed so rapidly that no time would be given for adsorption the surface-tension would rise to a comparatively large value. Polar liquids are in general mutually soluble; also slightly soluble polar liquids are soluble in other liquids similarly showing slight polarity. The idea that potential differences and the other energy-relations at surfaces, together with certain phenomena of adsorption, colloid formation, and solubility, might be explained on the basis of the polar setting of molecules in surfaces appeared to the authors of the paper some years ago. The adsorption of a substance in a benzene-water interface is greater for any particular salt than it is in the water surface whenever the organic radical is of such a nature that it would be expected to be soluble in the benzene, and this may be a general relationship. This point is now under investigation. It is found that a polar group, such as COOH, SO<sub>3</sub>H, OH, CN, NH<sub>2</sub>, and others, and their salts, will drag into solution in water a short slightly-polar chain, such as a hydro-carbon, but as the length of the slightly-polar chain increases, the solubility of the com-

\*Abstract: *Jour. Am. Chem. Soc.*, Vol. XXXIX, No. 3 and 4.

pound with one end polar and the other slightly-polar rapidly decreases; also, as the length of the slightly-polar, which may be called the insoluble end of the molecule, increases, the adsorption in the surface liquid-vapor from a polar solution increases. The increase in adsorption in such solutions is easily explained by the tendency of water to throw out the insoluble radical, but to hold to the one which is soluble. On this basis there should be an average orientation of such solute-molecules in a water surface with the active or polar end toward the liquid and the slightly-polar end toward the vapor. At an interface between two liquids the polar end would be expected to turn toward the polar liquid, and the slightly-polar end toward the slightly-polar liquid. Also, in the case of a single pure liquid, if it is of the polar type, it would be expected that the polar ends of the molecules would have an orientation toward the inner side of the surface. From this standpoint the ends of the molecules that stand outward in the surface of a pure substance consisting of molecules containing a moderately long paraffine chain attached to a polar group, should not be very different from those in a liquid paraffine, since in both cases the extreme outer surface would be made up of paraffine groups. The positive adsorption in a liquid surface of organic acids, or salts of organic acids, depends on the fact that one end of the molecule is less soluble than the other. The films of solutes positively adsorbed at either liquid-vapor surfaces or liquid-liquid surfaces, frequently become saturated. The rapidity with which this saturation occurs depends upon the nature of the solute, and increases with the length of the insoluble end of the molecule. Thus sodium oleate in water is highly adsorbed, and the surface-tension of the solution decreases with extreme rapidity. After the concentration of the solution reaches the value 0.002 normal the surface-tension no longer decreases, but remains constant up to 0.1 normal or more, proving that the film has become saturated. The stability of emulsoid particles seems to be brought about by orientation of molecules at the interface with the medium of dispersion. The best emulsifying agents, for example, have very long molecules, with a polar or active group at one end of the molecule. For the emulsoid particle to be stable the molecules which make the transition from the interior of the drop to the dispersion-medium, or the group of molecules making up the film, should fit the curvature of the drop. Therefore, the surface-tension of very small drops is a function of the curvature of the surface.

COLLOIDS when precipitated from their solutions or suspensions by an electrolyte yield a precipitate which always contains a definite amount of the ion to the influence of which the precipitation was due, the quantity retained being proportioned to the equivalent of the ion. For example, the precipitate obtained by the action of barium chloride solution on arsenious sulphide sol has the composition  $90\text{As}_2\text{S}_3 + 1\text{Ba}$ , the barium being pres-

ent as hydroxide. On washing this precipitate with calcium or strontium salts the barium is replaced by equivalent quantities of these metals. As the coagulum contains the positive ion, which cannot be removed by washing with water, the liquid becomes acid, and the acidity can be determined by titration. The phenomenon is known as adsorption, and is similar in character to the adsorption of gases by charcoal.

## Behavior of Aluminum in Cyanide Solutions

Metallic aluminum is used as a precipitant of gold and silver from cyanide solutions, replacing zinc in certain cases. Furthermore, aluminum in a soluble form occurs in certain gold and silver ores. On account of the fact that there is little specific knowledge regarding the behavior of aluminum in cyanide solutions, the reactions occurring between metallic aluminum and the caustic alkalies were investigated by the Bureau of Mines, and a particular study was made of the ore and pulp from the Goldfield Consolidated mine, Goldfield, Nevada, as that ore is one of the best examples of the occurrence of soluble aluminum salts in a precious-metal ore. The aluminum occurs as a sulphate, and is the result of the decomposition of minerals containing aluminum. This work has been completed, and the chemical reactions taking place under the conditions of mill-operation have been established. The more important conclusions reached were that there are two aluminates of calcium formed, namely, a primary aluminate when alumina predominates, and a secondary aluminate when lime is in excess. The primary aluminate is soluble, whereas the secondary aluminate is not; therefore, in mill-operation, if troublesome insoluble aluminum compounds in the precipitate are to be avoided, the amount of lime used in milling must be restricted to no more than that necessary to form the soluble aluminate. It might be explained that lime is universally used as a source of alkali in cyanide work, and also as an aid in settling slime; hence, if aluminum is present, it is important to know the behavior of the calcium aluminates formed in the humid way. Upon the addition of lime during cyanide treatment, first the primary and then the secondary aluminate is formed. The presence of aluminum accounts for the rather high consumption of lime in treating such ores. It was found that, contrary to popular supposition, precipitated aluminum salts did not cause waste of cyanide by carrying down adsorbed cyanide when the sulphates were present. On the other hand, during the precipitation of cyanide solutions with metallic aluminum, under certain circumstances when an aluminum salt is precipitated, cyanide is lost through adsorption. In connection with this investigation, it was found that too long contact of the solution with the precipitant, whether aluminum or zinc, caused a loss of cyanide, probably through decomposition by the nascent hydrogen evolved.

# REVIEW OF MINING

*As seen at the world's great mining centres by our own correspondents.*

## VANCOUVER, BRITISH COLUMBIA

### REPORTS FROM MINING DISTRICTS

From the Omineca district comes news of development and progress. Old mines are being improved and new ones are being opened.

In the Rocher Deboule mine, near Hazelton, a shoot of ore has been opened. Development of new ore is satisfactory and considerable tonnage is exposed.

The Delta Copper Co. controls the Delta and Chicago groups, as well as several other locations, in all twenty-five claims. They adjoin the Rocher Deboule on the east. Active work was carried on during last winter on the Highland Boy and the Delta groups under the supervision of G. A. Clouthier, the newly appointed government engineer in charge of No. 1 district. At present the necessary communication with the railway is being completed and work is being concentrated on that while the weather permits. In addition to the known exposures of ore on this company's property a fine showing of copper was found the other day on the Delta group's Lucky Jack claim. Six feet of the vein is reported to run 5½% copper. As soon as communication is established the company intends to actively work the known orebodies, and good results are expected. Harrison Clement is managing this property for the Delta Copper Co. Most of the financing is being done from Edmonton and there is said to be much capital interested.

The Hazelton View and Indian groups, comprising eight crown granted claims, are owned by the New Hazelton Gold-Cobalt Mines. They adjoin the Rocher Deboule company's ground on the west and north. Since last summer a tunnel has been driven on the main gold-cobalt vein on the Victoria claim and a number of high-grade shoots of promising ore have been cut. An interesting feature of this work has been the development of several shoots of molybdenite ore, which have successively shown richer content. They occur quite distinctly from the gold-cobalt ore-shoots, and assays show from 5 to 20% molybdenum. The company is about to install a light aerial tram to take ore from the adit down the mountain to a point from which it can be packed to the railway pending the construction of a wagon-road. Stopping is being commenced on both the gold and molybdenite ores with the intention of making a shipment of each class of ore as quickly as possible. It is understood that the plans of the company for this season include considerable exploration and development work on several parallel veins. They will also do some work on their copper veins.

Adjoining the New Hazelton Gold-Cobalt Co.'s holdings on the west, a group of ten claims is being developed by a Vancouver syndicate.

The Golden Wonder group, owned by W. S. Harris and Denis Comeau, of Hazelton, has been bonded to M. W. Sutherland, who has been conducting development work upon it. The group is situated at the foot of the west slope of Rocher Deboule mountain on the Hazelton wagon-road.

Work is being carried on at the Comeau group, which lies on the west slope of Rocher Deboule mountain, between Hazelton View and the Golden Wonder group. The owners, Denis Comeau and Magnus Johnson, are driving a tunnel on one of the promising outcrops.

The Silver Standard mine is installing a new power-plant,

consisting of gasoline engine, dynamo, compressor, boiler-plant, and shop equipment. It will enable operations at the mine to be carried on to better advantage. Erection of a concentrator is now being considered.

Reports from Talkwa indicate considerable mining activity in the surrounding territory. Representatives of a number of well-known mining and smelting corporations are at present in the district examining properties. Among the companies represented are the Granby company, the Consolidated of Canada, the American Smelting & Refining Co., and the Tonopah Mining Co. The Tonopah company has bonded the Wilson Brothers claim near Knockholdt station on the Grand Trunk Pacific railway.

Upon completion of the Babine road the Cronin mine will ship ore and it is expected that the Debenture Mines will also be ready at that time to join the list of shippers.

Prospecting is active on the main branch of the Telkwa river, the Babine mountains, the Sibola country, and to the south of Houston.

There is a good deal of interest in the work of the geological survey of the Hazelton district, which is being carried on by J. J. O'Neill of the Dominion Geological Survey Branch. He is conducting a detailed survey of an area fifteen miles square, embracing all the district immediately surrounding Hazelton and the main working-camps.

A complete index to the forty-two million dollar mining industry of British Columbia is provided in the mineral exhibit at the Vancouver exhibition which opened last Monday. The display occupies the entire upper floor of the forestry building and is under the charge of the Vancouver Chamber of Mines, the honorary secretary of that institution, James Ashworth, having supervised the arranging of the display.

The Dunvegan mines, on the head-waters of Fish river and about ten miles east of Revelstoke, have been purchased by a group of capitalists represented by R. A. Grimes of Calgary. A company is being formed to be known as the Dunvegan Mining Co., Ltd., and it will be capitalized at a quarter of a million dollars.

Development work has been started on the Montgomery group at Downie, which was recently bonded to the Granby Mining Co. of Phoenix.

Ore is now being packed down from the Mastodon mines on Laforme creek, twenty miles north of Revelstoke. A trail from the Columbia river is under construction by the company and as soon as it is finished it will be possible to make shipments.

The Merritt Collieries are installing a compressor and drills at No. 3 mine of the Diamond Vale property. Production is on the increase and work has been carried on steadily since the mine was opened last winter.

The Donahue Mines at Stump lake will resume operations about September 1 next.

On August 29 there will be a special meeting of the stockholders of the Canada Copper Corporation, for the purpose of authorizing the issue of \$2,500,000 ten-year 6% first mortgage sinking fund convertible bonds. They will also act on the proposal to increase the authorized capital stock a million shares, of which 833,333 would be held for conversion and the remainder for corporate purposes.

A good strike of ore is reported to have been made at the Ontario mineral claim at Kimberley. A force of eight men

is working on the property, which is owned by Sir Daniel Mann, vice-president of the Canadian Northern railway.

It is reported that arrangements have been made for 20,000 ft. of diamond-drilling on the Britannia Mines property on Howe sound.

The Standard Silver-Lead Mining Co. has been engaged in exploration work by diamond-drilling.

There is not likely to be any dividend disbursement by the Rambler-Cariboo Mining Co. in August. Recent shipments to the smelter have not fulfilled expectations.

The Florence Silver Mining Co.'s new 300-ton mill is now handling 220 tons of ore per day and is producing about 32 tons of concentrate.

From five to ten feet of ore has been struck in a drift in the Cork-Providence mine. The company owns a concentrator, and when the new ball-mill is in place, shipments will be started.

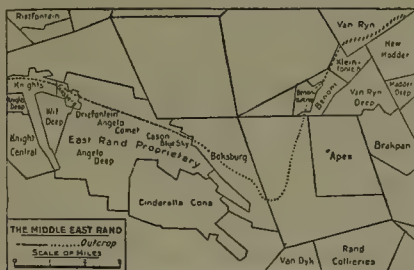

With a capitalization of \$300,000 the Beatrice Silver-Lead Mines, Limited, has just been incorporated to take over the Beatrice Mines from the bondholders, Messrs. K. G. McRae and S. Daney of Ferguson.

The Vancouver Chamber of Mines has secured new and better quarters on the second floor of the Dominion building. They will have about 2500 sq. ft. of floor space, about five times the amount in the present rooms in the Molson's Bank.

## JOHANNESBURG, TRANSVAAL

UNDERGROUND WATERS.—EAST RAND PROPRIETARY.—NEW FAR EAST AREAS.—CON. MINES SELECTION.

**EAST RAND PROPRIETARY MINES.** From what has appeared in previous letters with respect to the tapping of underground springs of water yielding nearly 5,000,000 gal. of water per day at a depth of 4000 ft. in the East Rand Proprietary mines,

little surprise will be felt that it has been deemed advisable to modify the scheme proposed to prove the southern area, by the driving of two cross-cuts and afterward sinking to the banket. R. C. Warriner, now consulting engineer to the company, has recommended that instead of driving two converging cross-cuts 2000 ft. long from the Angelo Deep shafts and then sinking from the point of convergence for another 2000 ft. to the banket, that a circular shaft be sunk from the surface in the place of the flooded cross-cut. This shaft will be about 6000 ft. deep. It is worthy of notice that the shaft is to be circular in shape, and no doubt the engineer has acted wisely in selecting this shape, seeing that the shaft will be largely used for ventilation and will possibly have to pass through heavily watered ground. It may be pointed out that the Driefontein Deep shaft, situated on the westerly boundary of the East Rand property, and having practically the same strata to pass through as the proposed circular shaft, was stopped by the inflow of water, but not before a heavy loss of life had occurred through the shaft collapsing while in course of being sunk. It will therefore be interesting to watch the progress of this circular shaft, for the Driefontein Deep shaft was rectangular in shape. At the annual meeting of the stockholders of the East Rand Proprietary the chairman pointed out the serious

position of the company. The working-profit last year reached £497,165, which was £103,826 less than for the preceding year. The ore milled during the year was 1,939,200 tons, a decrease of 44,400 tons, while the yield was 24s.4d. per ton, a decline of 9s.2d. per ton. The working-cost had risen to 19s.3d. per ton.

**NEW FAR EAST AREAS.** The Union Government has called for tenders for the exclusive right to work four of the most fancied gold-mining areas on the Far East Rand, and there is every likelihood of keen competition between the various groups to secure the leases. The areas now thrown open for competition consist of the triangular Springs Farm along with a small portion of Geduld, an area amounting to 2050 claims, the eastern portion of Geduld Farm between Cloverfield and Geduld Deep, the two other areas consisting of the remainder of De Reitfontein Farm less the portion already taken up by the Springs Mines.

The Consolidated Mines Selection Co., which controls the Brakpan, Springs, and Daggafontein mines in this neighborhood, is expected to secure at least two out of the four areas, while the Geduld Proprietary Mines is expected to make an equally strong bid for the Geduld area consisting of 2526 claims, and situated alongside their present mynpacht. Had the adjoining Grootvlei mynpacht been considered sufficiently attractive to American capital when invited to participate a year ago, it is thought that the Grootvlei Proprietary Mines might also have competed for this area, but there seems little possibility of any competition now arising from that quarter. Both of the De Reitfontein areas, each consisting of 2236 claims, ought to prove attractive to the controllers of the Springs Mines and should they succeed in obtaining both areas, the Consolidated Mines Selection Co. will be heartily congratulated. The Springs area is estimated to require £800,000 for shaft-sinking and development, and an additional £700,000 for equipment before being brought to the producing stage, whereas the three other areas are each estimated by the Mines Department to require £900,000 for shaft-sinking and preliminary development, and £800,000 for equipment. As regards the probable depth to the banket, the Geduld East area has the advantage, as it is estimated to be 3000 ft. as against 3500 ft. for the Springs area. The depth of the 'reef' on the De Reitfontein east area to the immediate dip of the Springs mynpacht cannot be less than 5000 ft., and on the western area the depth will run from 4000 to at least 5000 feet.

## CRIPPLE CREEK, COLORADO

AJAX MINE.—ORE DISCOVERY AT THE C. O. D.—EL PASO.—ROOSEVELT TUNNEL

An important discovery at depth is reported from the Ajax mine on Battle mountain. The property is under lease to the Carolina company. W. S. Black is superintendent. The shaft was recently sunk to 1800 ft. and the main Ajax vein cut at this depth.

A surface discovery of promise has been made by a prospector, Tom Ross of Cripple Creek, on the property of the C. O. D. M. & D. Co. in Poverty gulch. The vein, a new one for the C. O. D., has been opened at the surface and a trial shipment of float and ore from the vein is at a local sampler. The quartz pans freely. The strike was made on the west side-line and close to the El Paso Gold King line. The El Paso Gold King is the oldest producer on the west end.

A new vein has been opened up by the J. H. B. Leasing Co. The discovery was made at a depth of 60 ft. The quartz assays one ounce gold per ton.

Operations have been resumed at the main shaft of the Blue Flag G. M. & M. Co. on Raven hill. An underground airhoist has been set in place at the bottom station, 1100 ft. from surface, and the shaft is to be deepened 300 feet.

The El Paso Extension company, Al Campbell, superintendent

ent, has started an adit from the south-western slope of Beacon hill through the Rocky Mountain and North Slope claims. The adit will cross-cut at considerable depth the extension of the El Paso, Tillery, and Little May veins of the El Paso vein system.

A 100-hp. electric hoist has been installed at the Wild Horse mine of the United Gold Mines Co., near Midway on Bull hill. The company is cross-cutting and will resume sinking operations. The shaft is 1250 ft. deep.

The Big Toad M. & L. Co., a new corporation, has taken over the Gowdy-Chapman lease on the Dante mine of the Dante G. M. Co., on Bull hill, and the Reid mill, on the property, will be used for the treatment of low-grade mine and dump ores.

The narrow-gauge spur extending to the El Paso Con. Gold M. Co.'s main shaft on the western slope of Beacon hill is being widened to broad-gauge. The property is shipping from 6 to 8 cars of milling ore per week.

The Roosevelt tunnel of the Cripple Creek Deep Drainage & Tunnel Co. was advanced 95 ft. in the first 15 days (single shift) of August.

### GOLDFIELD, NEVADA

#### REPORT OF GOLDFIELD CON. M. CO.

During the month of July 1917 the Goldfield Con. M. Co. produced 18,400 tons from which resulted net realization of \$9809.21.

DEVELOPMENT WORK. 1690 ft. of development work was performed at a cost of \$7.10 per foot.

OPERATING COSTS. The operating costs of the company were as follows:

	Per ton ore handled	Per ton total ore
Mining:		
Stopping .....	\$2.925	
Development .....	1.742	
Total mining .....	3.454	\$3.048
Leasing expense .....	1.884	0.142
Dump moving .....	0.511	0.022
Transportation .....	0.087	0.087
Milling .....	2.534	2.534
Marketing .....	1.496	1.496
General expense .....	0.390	0.390
Bullion tax .....	0.005	0.005
Filter royalty .....		
Flotation royalty .....	0.069	0.024
Surface .....	0.060	0.060
Total operating costs .....		\$7.808
Miscellaneous earnings .....		0.764
Net operating costs .....		\$7.044
Construction .....		
Net costs .....		\$7.044

#### DEVELOPMENT ON MAIN LEVELS, JULY 31

MOHAWK. On the 450-ft. level, 200 ft. south-east from the shaft, 307-EY sill was cut and produced 18 tons of \$71.72 ore.

LAGUNA. On the 600-ft. level, 620 ft. north-west from the shaft, 302-J raise was run and produced 223 tons of \$10.19 ore.

CLERMONT. On the 750-ft. level, 430 ft. north from the shaft, 450-B sill was extended and produced 241 tons of \$17.05 ore.

On the 1250-ft. level of the Grizzly Bear mine, 250 ft. south-east from the shaft, 802-E sill was extended and produced 384 tons of \$12.69 ore.

LESSEES. During the month lessees produced 1386 dry tons of ore having a gross value of \$22,436.29, of which the company received net \$8505.79.

### TONOPAH, NEVADA

#### MILL AND PRODUCTION REPORTS

The Tonopah Mining Co. during July milled 7452 tons of ore with a value of \$109,130, making a net profit of \$40,300. During the past week the production was 2600 tons. During the past week the Tonopah Extension Mining Co. produced 2380 tons of ore; 23 bars of bullion, having a value of \$51,000, was shipped to the smelter. The bi-weekly clean-up of the West End mill consisted of 31 bars of bullion valued at \$52,885. The ore production the past week was 943 tons. The Tonopah Belmont produced 2325 tons of ore in the past week. The Belmont mill shipped 50 bars of bullion and 30 tons of concentrate with a combined value of \$109,895. The plant at Millers shipped 25 bars of bullion valued at \$49,240.

The production of the Jim Butler the past week was 900 tons, the Rescue-Eula 126 tons, the Montana 78 tons, and the Cash Boy 55 tons, making the week's output at Tonopah 9407 tons with a gross value of \$164,622.

### BUTTE, MONTANA

#### SOUTH-WESTERN BUTTE DISTRICT.—HAYDEN-STONE INTERESTS.

In the south-western part of the Butte district the larger mining companies have resumed. This part has been idle for many years, owing to the low price of silver and the large amount of zinc in the ore. With silver at its present price and zinc so readily recovered by milling methods, a great incentive is offered for re-opening the old producers. Among the latest to start active operations are the Clark interests, which are developing the Travonia property. The old Travonia shaft was 300 ft. deep and on the 300-ft. level had about a 1000-ft. cross-cut. As soon as the shaft is unwatered it will be re-timbered and sunk to the 500-ft. level, and then cross-cutting will begin. The veins of the Travonia and adjoining claims owned by Clark are among the richest silver-zinc veins in the district, and were heavy producers in the early days. In addition to the silver-zinc ore, a large body of manganese ore is ready to be mined. This will be exploited by the open-cut or glory-hole method as soon as arrangements can be made for the milling of it. At present there is a large construction crew at work, putting in boilers, a compressor, and a steam-hoist. It has been decided to replace the steam-hoist with an electric hoist as soon as one can be obtained. The Anaconda company is operating the Nettie and the Emma, as well as the Bonanza. The Hayden-Stone interests and J. L. Bruce, of the Butte & Superior, are opening up a group of claims through the Germania shaft. This is one of the early-day producers of high-grade silver-zinc ore. The Davis-Daly company is opening up the Hibernia, and also mining manganese ore on this property. The Butte-Detroit is working the Ophir. The Britannia is being opened by W. L. Creden.

### JOPLIN, MISSOURI

#### PRICES.—MARKET.—PRODUCTION

The Joplin News-Herald gives the following summary of the Missouri, Kansas, and Oklahoma zinc and lead region:

#### AVERAGE PRICES FOR AUGUST

	High	Low	Average
Week ended 4.....	\$75	\$65	\$70
Week ended 11.....	75	65	70
Week ended 18.....	75	65	70
Week ended 25.....	75	65	70

Average for month, \$70.

No change in wage scale.

A noticeable increase in the demand for all grades of zinc ore last week led producers to believe that higher prices might be expected during the week. Although the price for high-

grade ore was unchanged at \$75 per ton, in carload lots, second grades were stronger, selling for as high as \$72.50 per ton in some instances. The range was from \$65 to \$75, with an average basis price of \$70.

Buyers were in the market for practically every pound of ore the producers had in their bins. However, quite a number of operators, with large amounts of ore stored up, held under the belief that the increased demand might lead to better prices. One operator with something like 500 tons of zinc in his bin refused an offer for the lot.

Just what the sudden flurry among the buyers for increased lots of ore was caused by, operators are at a loss to say. One mining man advanced the theory that the strike at the Anaconda Copper Co. in Montana might have caused a shortage in the zinc metal market, and therefore the demand for ore.

Prices for lead were unchanged, choice ores bringing \$100 per ton. Calamine was unchanged at from \$38 to \$40 per ton.

The spelter market is dull and weak following the further decline in price as quoted by the New York metal market. Pro-

TOTALS FOR WEEK		
	Pounds	Value
Blende .....	21,425,250	\$765,343
Calamine .....	1,569,710	34,032
Lead .....	2,761,400	137,800
AVERAGE VALUE PER TON		
Blende .....		\$70
Calamine .....		43
Lead .....		100

WASHINGTON, D. C.

DIRECTOR MANNING REVIEWS THE OIL SITUATION.—SCARCITY OF WELL-DRILLING SUPPLIES.—INCREASE IN COST OF SUPPLIES.—NECESSITY FOR THE USE OF MUD-LADEN FLUID IN OIL-WELL DRILLING.

In a review of the oil situation in its relation to war needs, Van H. Manning, director of the Bureau of Mines, stated that the situation is critical, for the operators find themselves unable to obtain adequate supplies for the drilling of oil-wells. If they are unable to drill new wells, our present production cannot be maintained, much less be increased, for oil-wells do not maintain a constant production but show a steady diminution from the time they are first completed. Were no wells to be drilled for one year's time, our petroleum production would decrease at least one-fourth.

At the present time drilling is being curtailed because of the difficulty in obtaining supplies. Not only have the costs of oil-well supplies been increased, but it has become impossible to get them in adequate quantities for any price, and the situation is now worse than at any time since the War in Europe started. Perhaps the situation of the producer is best illustrated by the fact that from California to the fields of Pennsylvania

the small producing wells are being abandoned in order to use the casing and other equipment of these wells in new wells from which larger productions are expected, thus, wells still capable of small profitable production are being permanently abandoned in the desperate search for well-drilling materials.

For saving, attention is called to a method long advocated by the engineers of this bureau. He refers to the use of mud-laden fluid in the drilling of oil-wells on which method the Bureau of Mines has published Bulletin 134, obtainable free of charge from the Washington office. By this method of well drilling, less casing is necessary and by intelligent application of the methods outlined in Bulletin 134 the same amount of casing can be made to supply a greater number of wells. This is a method that has long been in use in Texas, Louisiana, and California in connection with the rotary and circulator drilling system and in the wells drilled by these methods less casing is necessary than in other fields. During the last few years, the use of mud-laden fluid has been demonstrated to be entirely feasible in wells drilled by the standard-tool system in the oilfields of the Mid-Continent district and farther east, and that it possesses desirable features not to be overlooked by the operator. Where casing is difficult to obtain the saving that can be effected is of first importance. One of the largest operating companies in the Mid-Continent district is using the method to great advantage.

The Bureau of Mines maintains a staff of engineers and practical drillers who have made a special study of this process, and will gladly see that an expert is sent to consult with the operators in any district who show themselves sufficiently interested.

ducers say that a further curtailment of operations will be forced by the decline in the price to \$8 per hundred pounds. The mid-year statistics showed that 35,000 retorts, or more than one-seventh of the total, were idle on June 30, although the market in June never went below \$9.

Following is a report, in pounds, with values of zinc, lead, and calamine ores produced in cities, towns, and camps in the Missouri-Kansas-Oklahoma district for the week ended August 25:

ZINC AND LEAD PRODUCTION		
	Blende	Lead
Miami .....	7,142,630	408,540
Webb City-Carterville .....	4,944,330	1,214,540
Joplin .....	2,596,010	345,190
Duenweg .....	1,362,950	116,090
Oronogo .....	1,028,170	247,840

Wentworth .....		124,920

# THE MINING SUMMARY

*The news of the week as told by our special correspondents and compiled from the local press.*

## ALASKA

(Special Correspondence.)—Rich telluride ore has been struck in the Marble mine. Molybdenum discoveries are reported. The Martin mine is working a full crew. The Gold Cord Co. has developed 12 ft. of \$36 ore. A 2400-ft. aerial tram, connecting with the Independence mill, will be installed by the same company. The Independence M. Co. is restricting its work to development. The Rae-Wallace Co. has purchased the Ike Rosenthal group and will install a 50-ton mill and a 1600-ft. aerial tramway. A motor truck will be used to transport supplies.

Willow Creek, August 11.

By the end of 1917 the main-line grade of the Alaska railroad will reach mile 210. The Engineering Commission will build a pier at Anchorage. The Tanana Valley Railroad has been taken over by the Commission.

The discovery of platinum in the gravel of the Kahiltna river by Dr. Herdschel C. Parker of New York has resulted in the assignment of four Government experts to study and report upon the situation. Alaskan gold miners report platinum in the Ketchikan, Koyukuk, Fairhaven, and Christochina districts.

## ARIZONA

Owing to the unsettled conditions existing in Arizona mining districts local meetings of the A. I. M. E. will be indefinitely postponed.

### MARICOPA COUNTY

(Special Correspondence.)—The Mendota Mining Co. has purchased the Yorba Mining Co.'s property in the Harquahala district. Work has been commenced on the road between the property and Aguila, the railroad point. Development preparations are being made.

Wickenburg, August 18.

### MOHAVE COUNTY

(Special Correspondence.)—It is announced that N. P. Moerdyke and E. M. Rabb of the Tom Reed Gold Mines Co. have resigned. Assistant superintendent W. B. Phelps will take Mr. Rabb's place temporarily at least. Mr. Moerdyke was elected president of the company a year ago last April, for the purpose of adopting a progressive management and to carry on a programme of development. Mr. Rabb was employed as superintendent. During the past year important projects have been carried to completion, including the development of the Aztec orebody for a distance of over 1000 ft. One hundred thousand tons of ore has been developed in this working. It averages about \$8 per ton and with rising costs of mining and milling, economy will be necessary for profitable operation.

It is expected that the new management will discontinue development and institute a policy of retrenchment. The new mill is handling ore at much less cost than the old, the principal problem to be solved being that of mining.

F. M. Graff, president of the Graff Coal Co. of Pittsburgh, a large stockholder in the Oatman Combination property adjoining the Aztec claims of the Tom Reed, thinks so well of the property after a recent examination of it that he will finance further development on an extensive scale.

The Gold Ore Mining Co. has leased a portion of the Gold Road mill and will treat about 50 to 75 tons of ore per day.

The Gold Ore is about one mile north of the mill and a tramway will be installed to convey the ore. About 2000 tons of ore was shipped from the Gold Ore to the mill when the latter was in operation a year ago last spring.

Oatman, August 28.

(Special Correspondence.)—The Payroll is sending 35 tons of ore daily to the mill at Needles. The New Tennessee is opening up a good body of ore in the north drift, 240-ft. level. New Mohawk shipped a car of gold-silver ore to Selby's on August 18. Schenectady is hoisting high-grade ore from the north and south drifts, 175-ft. level. A carload is soon to go to the smelter. Copper Age struck 14 in. of shipping ore in the new adit at 700 ft. The same vein is being opened in the south drift upper tunnel. The mill has been started up. The furnace department is well under way to completion. The Keystone mill is expected to resume this month. Several thousand tons dump ore is ready to be milled. The mine will then be unwatered and operated. The Rattlesnake mine has a carload of silver-lead ore in its bins ready for the smelter. The Diana has shipping ore on the 200-ft. level. The Bullion Hill shaft is nearing the 300-ft. level. A station is to be cut and the shaft continued to the 400-ft. level where cross-cutting will be started. The Union Metals Co. has arranged with the owners of the Golconda mine to run a 600-ft. cross-cut from the latter's 1100-ft. level to intersect the vein at a depth of 800 feet.

Chloride, August 24.

(Special Correspondence.)—The Red Lion Mining Co. is about to start development work. Arrangements are being made to sink a 500-ft. shaft and to develop the property. The Rico property is being systematically developed. The Gold Ore Co. will construct a 10-stamp mill and a cyanide plant for the treatment of 50 to 75 tons of ore per day. A big strike has been made 700 ft. in the main adit of the Copper Age (Arizona Ore Reduction Co.). The ore is high grade and carries gold, silver, lead, copper, and zinc. The mill will be ready for operation in a week or 10 days. Ore is picked and shipped at present. A strike of silver ore is reported by prospectors in the Wheeler wash district of the Hualpai mountains. A silver-gold strike has been reported recently in the old Weaver mine. The mine is situated 28 miles north of Chloride and is under lease to Parry and Bonsall.

Kingman, August 18.

The Gold Ore Co., at Goldroad, is preparing to sink its shaft to a depth of 700 ft. A two-mile tram has been purchased and will be installed.

### PINAL COUNTY

(Special Correspondence.)—A contract for the treatment of the Mammoth mine tailing has been let to S. G. Musser and associates of Los Angeles. The erection of a \$20,000 flotation mill for preliminary testing has been ordered. The Ray silver-lead property is shipping 20 tons of ore daily. The Curry Mining Co. has been formed and has received authorization to dispose of 200,000 shares. The company has taken over the William Curry group of seven claims in the Silver King district. William Curry will be in charge.

Florence, August 17.

It is reported officially that the adit of the Fortuna mine at Superior has cut two feet of rich ore. The first class assays 492 oz. silver per ton and 14% copper; the second class assays 196 oz. silver and 11% copper.

## SANTA CRUZ COUNTY

(Special Correspondence.)—Development is being pushed at the Idaho mine in the Oro Blanco region. Copper ore carrying gold and silver is being taken out. There is 3000 tons of concentrating ore on the dump. The erection of a small mill is being considered.

Nogales, August 18.

## YAVAPAI COUNTY

(Special Correspondence.)—The result of an examination of the Jerome Copper Co.'s holdings at Jerome and Moyer has been the purchase of the controlling interest in the Jerome Copper Co. by the General Development Co. The Moyer-Bedford mine, locally known as the Christmas mine, and the Moyer holdings of the Jerome Copper Co. are included. W. Tovote, an engineer formerly with the Copper Queen at Bisbee, has taken charge of the Loma Prieta Co. in Copper basin. The Verde Hub has engaged J. E. Wallace, an experienced diamond-drill man of Michigan, to prospect the property.

Prescott, August 18.

## YUMA COUNTY

(Special Correspondence.)—The Swansea mine, under lease, is shipping 30 cars of ore per week. The new three-compartment shaft is down 125 ft., and it is expected that ore will be reached at 300 ft. The completed shaft will be 500 ft. deep, and will be used to develop orebodies already discovered. It is reported that the Clark copper interests will construct a new smelter at Swansea during the coming winter.

Bouse, August 18.

## CALIFORNIA

During the week ended August 25, fourteen new wells were started, bringing the total since the beginning of the year up to 710. Thirty-five wells were reported as ready for test of water shut-off, 12 deepening or re-drilling, and three abandoned.

In the Whittier field two new wells are reported, one on the Murphy-Coyote lease producing 10,000 bbl. daily and the other on the Baldwin-Montebello lease producing 800 bbl. daily.

## AMADOR COUNTY

(Special Correspondence.)—The Argonaut Mining Co. at Jackson has just completed installing a large pumping system. The water is pumped from its lowest level at 4300 ft. to a reservoir at the 2000-ft. level of the main shaft, and from this reservoir to the surface. Both large pumps are electrically driven.

The Keystone mine is said to have made a \$1500 profit in July. The improvement is due to systematic development on the lower levels, particularly the 1200 and 1400. Good ore is also being mined on the 1800-ft., or lowest, level.

A rich strike in the Hardenburg mine on the Mokelumne river, south of Jackson, is reported during the week. The find was made on the 1500-ft. level in the north drift, the assays from a well-defined vein ranging from \$16 to \$7600 per ton in gold. The ore is being saved by hand panning and sluicing instead of milling. This property is operated by the W. J. Loring company.

The South Eureka company has directed its attention to the Oneida mining property, which it purchased a few years ago to work in connection with its Sutter Creek holdings. Prospects have proved discouraging at the South Eureka mine. Ore of good grade has been in course of extraction from the Oneida property for several months and the mill on that ground is being worked to capacity.

Sutter Creek, August 24.

## BUTTE COUNTY

Prospecting for chrome, manganese, and quicksilver is active in the vicinity of Paradise, and chrome ore is being shipped by the Union Chrome Company.

## ELDORADO COUNTY

(Special Correspondence.)—The main deep channel containing gold-bearing gravel of the Rising Hope mine, three miles east of Placerville, was recently tapped through the bedrock by a 14-ft. raise from the face of a 2000-ft. adit. The gravel contains gold and is cemented, like concrete. The gold is coarse in size. From a gold-pan of gravel, gold \$2 in value was obtained.

A peculiar feature at the point tapped, 200 ft. or more below the surface, was the absence of water and a subterranean cavern between the lava-capped roof of the ancient river and the bed of gravel. The cavern was full of foul air.

The thickness of the gravel in the channel is 12 ft. Cross-cuts will be run across the channel to the rim on each side, and drifts will be extended up and down stream to open a large tonnage before installing a stamp-mill. A revolving barrel has been in operation at the mine for some time reducing the loose bench gravel. The manager, George W. Engelhardt, states that as soon as sufficient tonnage of the cemented gravel has been developed a 10-stamp mill will be installed.

Placerville, August 29.

## INYO COUNTY

L. D. Gordon, president and general manager for the Cerro Gordo Mines Co., reports that the same rich ore-shoot that has been worked down to the 200-ft. level had been caught on the 700-ft. level. The next step will be to develop this ore-body on the 500-ft. level and later on the 1100-ft. level. The company is now making a net profit of \$50,000 per month and has more than \$200,000 in its treasury.

## NEVADA COUNTY

(Special Correspondence.)—The Empire Mines Co. is installing a 2500-cu. ft. Ingersoll-Rand compressor of the Rogler type. It will be driven by a 500-hp. motor. At present 100 drills are in operation, and it is probable that 20 to 30 more will be added. Development below the 4600-ft. level continues to uncover ore of excellent grade; a 60-stamp mill is operating at capacity; 400 men are employed.

The shaft of the Allison Ranch has been dewatered to a point below the 700-ft. level and preparations are being made for mining in the deeper workings. The 20-stamp mill is supplied with good-grade ore from the third and fourth levels; 65 men are employed.

Preliminary surface work has been started at the Ford and Franklin mines, owned by Salt Lake capitalists, and adjacent to the Allison Ranch mine. The group is believed to contain extensions of the Allison Ranch vein-system.

The Washington Asbestos Co., Oakland capital, has purchased an extensive area of asbestos-bearing ground in the Washington district, a short distance from the Fairview mine. The deposit is about 150 ft. wide and has been traced for 5000 ft. The old 20-stamp Fairview mill has been acquired and a tram built from mine to mill. Arrangements have been made for the addition of special machinery to the mill for sorting. It is estimated that the product averages 10% of fine-quality asbestos. John D. Hoff, of Oakland, is president, and R. E. Conrad secretary-treasurer.

Grass Valley, August 25.

Junk from old mining plants continues to be gathered up wherever available. Old cable is being sold to logging camps at prices ranging from \$25 to \$50 per ton.

The 20-stamp mill, compressor-house, and change-house of the Blue Tent mine, owned by the California Powder Co., was destroyed by fire. The loss is estimated to be \$15,000.

## ORANGE COUNTY

Eighty-three wells are being driven in the Fullerton oil-field. There are 679 producing wells with a daily output of 43,485 barrels.

## SHASTA COUNTY

(Special Correspondence.)—The Balaklala Copper Co. (National Copper Co.) has just paid its second dividend. The amount is 40c. per share. The mine is shipping 200 tons of ore per day to the Mammoth smelter at Kennett.

The Accident Gold Mining Co. of French Gulch has been discontinued by order of the Superior Court. The Shasta Hills Mining Co. owns all the claims formerly held by the Accident. Kennett, August 27.

The strike at the Balaklala has spread to the Mammoth mine at Kennett. Seventy-five Italian miners, being denied a \$5 daily wage, struck. At the Iron Mountain mine 50 miners and other employees, bringing the number up to 200, are on strike. At the Stowell and Shasta King mines 50 men are out. Poor sanitation and a demand for an increase of one dollar in the daily wage are the principal points at issue. No violence has been reported. It is asserted that 1200 miners are out.

## SISKIYOU COUNTY

(Special Correspondence.)—The Homestake mine, owned by R. S. Taylor, and located on Taylor creek near Snowden in the Salmon river mining district, was recently equipped with a quartz mill and began operations last Monday. The ore is taken from the stope to the mill without rehandling. A 5½-ft. Huntington mill is contemplated. George A. Foster of the Oro Grande Mining Co. is operating the McKeen, the Trail Creek mine, and the Facy mine near Callahan. A crew of 20 men is employed and 30 tons of ore per day is mined from the McKeen mine. J. E. McFadden of the Siskiyou Dredging Co. of Oak Bar is at Callahan looking after his mining interests.

William Koerner of the Grey Eagle copper mines at Happy Camp reports that the air-compressors at the mine would be ready for operation the first of September, and that they are short of miners for underground work.

Hornbrook, August 25.

## TEHAMA COUNTY

(Special Correspondence.)—The Tedroc Chrome Co. is preparing to ship chrome ore to Red Bluff from its mines on Tedroc mountain, 52 miles west. The company built 12 miles of road from the mines to the county highway at a cost of \$27,000. Seven 7-ton auto-trucks have arrived and will be put at work, day and night, about September 5. Four thousand tons of chrome must be shipped on a Government order before snow falls.

Red Bluff, August 27.

## TRINITY COUNTY

(Special Correspondence.)—B. C. Clark of Sutter Creek has been made superintendent of the Globe mine at Dedrick, superseding Henry Sheafe, who was summoned to duty at Fort Leavenworth, Kansas. Sheafe is a captain in the engineering corps. Thirty men are employed at the Globe on development work.

Dedrick, August 27.

## TUOLUMNE COUNTY

(Special Correspondence.)—A small crew of men is busy at the Keltz, making surface improvements. Mining operations will be superintended by G. E. Cheda. The Keltz is an old mine and produced quite liberally years ago. The Western Exploration & Mines Co. has acquired a group of mines near Italian Camp and will soon begin active mining operations. The Black Oak, for several weeks past operated with a greatly reduced force, has added just six men. Good ore was recently uncovered in the bottom level. The Rosendale mine, on Table mountain, near Jamestown, is looking well and the operators are pushing development. Development of the

Driesam mine, at Arastraville, has been resumed with a small force of men.

Sonora, August 24.

## COLORADO

## BOULDER COUNTY

(Special Correspondence.)—The price of tungsten is satisfactory. Producing mines are increasing their output and the mills are operating at full capacity.

Eldora, August 31.

(Special Correspondence.)—Andrew Anderson has opened a body of high-grade silver ore in the old Caribou camp.—The Boulder Natural Gas Co., that has been incorporated for the purpose of drilling another well alongside the old Arapahoe well, has ordered materials and expects to commence operations next week.—Morris & Burr have just shipped 1400 lb. tungsten ore from their lease on the Wheelman property at Ferberite.—The aerial tram from the Good Friday mine to the canyon road at Boulder Falls will soon be in operation. The mine now produces steadily.—The tungsten mill of the Long Chance Mining Co., on Beaver creek, is operating day and night.—The Mountain Mines Co. is extending the Windy adit.—The Elsie mine is making preparations to deepen its present shaft.—The Fourth of July mine near Arapahoe peak is operating under the management of W. S. Harpel.

Eldora, August 18.

The Boulder Tungsten Production Co. is preparing to produce tungstic acid and ferro-tungsten. The output of high-grade ore and concentrate is continuing while the refining plant is approaching completion.

## LAKE COUNTY

The Ibex and Garbutt mine on Breece hill resumed operation with a decreased working-force. A \$4 per day wage scale has proved insufficient to attract men. Work has been resumed on the Bull's Eye property on Iron hill by C. Jarbeau of the Julia M. Company.

High-grade ore is being shipped from the Penrose shaft.

The Porter and Fairview properties are producing a combined output of 3000 tons per month.

Small orebodies have been discovered at the Penn properties on Breece hill. Lessees are operating on the New Monarch mine in Evans gulch.

In Leadville a strike of 2000 miners, pumpmen, and others has been discontinued and 80% of the workers have resumed their tasks, at a compromise wage scale of \$4 per 8-hr. shift.—The Yak Tunnel Co. expects to be shipping at the rate of 300 or more tons per month. The Down Town M. Co. is shipping 400 tons daily.

Preparations are being made on an extensive scale to mine the low-grade molybdenum ores near Climax by the American Metal Co. and the Molybdenum Products Corp. The ore contains less than 1% of molybdenum.

## PARK COUNTY

(Special Correspondence.)—The London Mining Co. has entered into a contract with the Pawnee Mining Co., for a mill-site, dumping-ground, and the use of the first 600 ft. of the latter's adit, in South Mosquito gulch. The work of enlarging the Pawnee adit from 4. by 6 ft. to 7 by 7½ ft. was begun in the middle of June. The surface improvements will cost \$25,000. Haulage in the adit will be done with storage-battery locomotives. Electric power will be furnished by a steam-driven generator. Later a mill will be built and a hydro-electric power-plant installed.—The Louisiana-Colorado Mining Co. has secured a lease and option on the Dolly Varden mine on Mount Bross and will begin the construction of a 2-mile aerial tram. There is an estimated tonnage of

ore on the dump of 75,000 tons, for the treatment of which a concentration and flotation mill will be erected. Etienne A. Ritter is manager.

Alma, August 20.

#### SAN JUAN COUNTY

During the month of August, 25 mines shipped 130 cars to outside smelters and 10 mines shipped 63 cars to the Silver Lake custom mill. The total production, including 30 cars shipped to the North Star mill, is 223 cars.

#### MICHIGAN

(Special Correspondence.)—No difficulty is anticipated in the shaft-sinking for the Old Colony-Mayflower to a depth of 1000 ft., where the broken zone is expected. Sinking is progressing rapidly.—The Michigan copper district has furnished 1200 men for the army and navy service, including the number taken in the first selective draft. This is a larger proportion than any county in the State, although the county, which produces little outside of copper, a war munition, could claim exemption for 75% of the men who have volunteered.—The length of life of Ahmeek is conservatively figured at 30 years, at a rate of production of rock at 1,800,000 tons per year.—The production of rock at the Franklin never runs below 1000 tons per day and often reaches 1400. It is hoped that ground will be broken by September 1 for the Seneca shaft. Surface buildings are going up rapidly. Several innovations in shaft-sinking, all calculated for speed and efficiency, will be inaugurated at the Seneca.—August production of Adventure will be 4000 tons.—Seventy-five cars of rock have gone to the mill from the South Lake shaft and 30 more will be sent down before September 1.—Installation of electric tramming at the Mohawk will materially benefit, since labor shortage has been a serious problem for some time. The quality of rock continues high and will compensate for diminution in tonnage.—Rock at the Phoenix is running 13 pounds of refined copper per ton, compared to 12.6 in June and 9.3 for the first six months of the present year. This betterment is due to mill improvements. The average tailing loss was six pounds for six months of this year. It is now close to four pounds. The mineral returns per ton are 18 lb.—Ahmeek's newer lower openings are in a grade of rock well up to the average and production will be increased in the expectation of securing new men. Dividends will be increased unless the price of copper goes down.—Three months ago the White Pine of the Calumet & Hecla was looked upon dubiously, as the shafts had exhausted the rich rock. Having returned the development investment, doubt as to its profitable operation on low-priced copper market was expressed. The recovery of large tailing losses by the flotation process and the discovery of richer ore in development make the outlook more favorable.

The Isle Royale Copper Co.'s mine has increased its rock shipments to the Point Mills stamp-mill, where the surplus from its own mill is handled. Over 800 tons per day is treated at the Point Mills, while the Isle Royale mill is milling its regular tonnage. Osceola is falling off and is 300 tons below its daily average for the first two weeks of August. Allouez, Franklin, Copper Range, Quincy, and Calumet & Hecla are making their average, but others are showing a slight falling off.

Houghton, August 27.

#### NEVADA

##### CLARK COUNTY

The Yellow Pine M. Co. declared a dividend of \$50,000 for August.

##### ESMERALDA COUNTY

(Special Correspondence.)—A working station has been cut on the 1750-ft. level of the Atlanta mine, from which point a winze will be sunk to a depth of 2000 feet and development

begun on the 1900 and 2000-ft. levels. The richest ore found in the Atlanta was opened on the 1750-ft. level, and A. I. D'Arcy, the manager, believed that the vein will extend into the shale and underlying alaskite. Shipments of high-grade copper-gold ore are being made to custom smelters.

The Jumbo Extension Co. has started prospecting new ground in the south-western section of the Poloverde claim and south-eastern end of the Velvet. Exploration of the latter is proceeding from the 1017-ft. level, and the Poloverde will be explored from the 830, 932, and 1017-ft. levels. The company is also driving from the Velvet shaft to intersect a large orebody recently opened at a depth of 650 ft. by the Goldfield Consolidated.

Shipping ore is being mined in the raise from the 300-ft. level of the Great Bend, the vein extending to this point from the 160-ft. level. High-grade material has been reported, and several shipments have been sent out recently that averaged \$65 per ton in gold.

The main drift on the 500-ft. level of the Red Hill-Florence is advancing on a 4-ft. vein of profitable ore, and raise No. 2 is also exposing good ore. The vein is a part of the Florence orebody.

The Goldfield Merger Co. is concentrating work on the 1350-ft. level, where, 400 ft. from the Merger shaft, a deposit of copper-silver-gold ore has been uncovered, which averages \$20 per ton. Small shipments are being made. It has been officially stated that the Jumbo Extension vein does not pass into Merger ground.

Goldfield, August 25.

##### HUMBOLDT COUNTY

Rochester Mines Co. reports 25 ft. of ore on the 900-ft. level. Average daily tonnage is 180.

The old Michigan and Nevada mine in the Humboldt range will be re-opened.

The Yerington M. & C. Co., operating the Adelaide mine, is making shipments of 5% ore at the rate of 200 tons per month. The American M. & E. Co. has purchased the 'Rye Patch Mines.'

##### LINCOLN COUNTY

The Prince Consolidated is shipping 300 tons per day. A sulphatizing and flotation process is being successfully used. Diamond-drilling is being used for exploration.

##### MINERAL COUNTY

The Nevada Rand Co. has decided to construct a 10-stamp mill.

##### NYE COUNTY

(Special Correspondence.)—One of the heaviest bullion shipments made by the Tonopah Belmont went out last week. From the Belmont mill 100,918 oz. of silver-gold bullion and 35 tons of concentrate were shipped, and the Millers plant sent out 47,234 oz. and 25 tons of concentrate. Satisfactory reports have been received from the Surf Inlet and Eagle-Shawmut gold properties.

Shipments have been resumed from the large orebody on the 1200-ft. level of the Halifax, the product going to the West End mill. Cross-cutting from the 12th and 17th levels is proceeding, but without particular change.

Eight sulphur claims near Cuprite have been acquired by George Wishart, E. Campbell Douglass, and capitalists of New York and London.

Tonopah, August 24.

The White Caps mill was started on August 22. In the mine development is proceeding on the 300, 400, and 500-ft. levels. Additional work is reported on the White Caps No. 2 shaft.

A gold strike is reported on Tulicha mountain in the south-eastern end of the county.

The joint shaft being sunk by the Extension and Zanzibar companies is making satisfactory progress. Foundations for

compressor and motor have been constructed. The machinery is on the ground and bunk-houses and dwellings are being constructed.

The Manhattan Con. M. Dev. Co. is sinking from the third to the fourth level. A block of ore 130 ft. slope distance between levels, 50 ft. in length and 28 ft. in average width, has been exposed. The average value is estimated to be \$30 per ton.

#### WASHOE COUNTY

The Le Duc Mining Co. filed articles of incorporation for the conduct of a general mining business. The directors are C. H. White, J. P. Jones, and C. J. Hogan,

#### NEW MEXICO

##### SOCORRO COUNTY

(Special Correspondence.)—James P. Porters and W. T. McCaskey, of Lordsburg, interested in the Tyndale Copper Co., have taken over the New Golden Bell mine and mill at Rosedale, about 30 miles west of San Marcial on the Santa

Bearup properties in the west side of the district. The owners have shipped some of the highest grade ore yet taken out of the district.

Mogollon, August 16.

(Special Correspondence.)—The Empire Zinc Co. and the Ozark M. Co. are operating in the Kelly mining district in the Magdalena range, twenty miles west of Socorro. One hundred lessees and 500 men are at work. Monthly shipments totaling 2500 tons of copper ore, 1000 tons zinc, and 2000 tons of lead ore are made. Two concentrators, one at Kelly and the other at Magdalena, are dressing the ores. The Empire Zinc Co. is developing the Lynchburg and the old Kelly mine and is constructing dwellings for workers and officers.

Magdalena, August 23.

(Special Correspondence.)—The Oaks Co. opened new ore in the Deep Down and Maud S. mines during the week. Ore shipments have been doubled. Production for August for the district will amount to nearly 12,000 tons. Mines and mills are working to capacity. The improved conditions of the road

PLANT OF THE EMPIRE ZINC CO., KELLY, NEW MEXICO

Fe railroad. The ore is gold, averaging about \$20 per ton. About 15,000 tons is on the dump. The 50-ton mill is in good repair. The main shaft of the property is 430 ft. deep, with nearly 5000 ft. of drifts and cross-cuts. The vein varies from 5 to 14 ft. in width. H. H. Shelley, of Lordsburg, will take charge and commence work immediately.—Another sale in the Rosedale district was that of the Rosedale mine to the Rosedale Mines Corporation of Chicago. Harry Carey, of Denver and Chicago, is interested in the company. The property consists of two patented claims with a shaft 732 ft. deep and 5400 ft. of other workings. It is claimed that the mine has 33,000 tons of ore blocked. A new 100-ton mill will be erected immediately.

Socorro, August 12.

(Special Correspondence.)—The recent strike on the 1100-ft. level of the Champion mine has increased in width and value. The ore is of a heavy sulphide and is high-grade. This is apparently the top of a new orebody and is another strong indication that the ores in this district go deep. Mr. Kelly and associates are opening up placer ground on Mineral creek. Considerable work has been done and rockers are being used.

The Oaks Co., operating the Deep Down mine, has completed the surface installation and is ready to begin sinking. Driving is in progress to connect with the Maud S. mine, also being worked by this company.

During the week examinations have been made on the

between Mogollon and Silver City has resulted in a large increase in the number of trucks and a large part of the freight is now handled entirely by auto-truck.

Mogollon, August 28.

#### OREGON

##### CLATSOP COUNTY

Serious forest fires are raging in 15 counties. Greatest damage is reported from the Minain, Deschutes, and Cascade reserves. The majority of the fires were found to be of incendiary origin.

##### JOSEPHINE COUNTY

(Special Correspondence.)—Robert Grimmett, who located chrome deposits near Holland, is now shipping the ore to Grants Pass.

Chrome deposits near Wolf creek are being developed by Dr. Reddy of Grants Pass.

The Waldo copper mine, at Takilma, is again in operation with a crew of 40 men under same management.

Grants Pass, August 13.

(Special Correspondence.)—Three motor-trucks have arrived at Grants Pass for the California Chrome Co.'s mine near Selma. Two were of 4-ton each, the third of 1½-ton capacity. Four more 4-ton trucks will follow. The distance from the mine to the railroad is 21 miles, with grades ranging as high as 20%. H. L. Egan accompanied the outfit.

It is stated that 10,000 tons of ore is in sight, half of which

the contractors expect to move before the rainy season arrives. Building of the truck-road from the mine, the loading-point on the Grants Pass-Coast road, 15 miles south-west of Grants Pass, cost \$32,000. The loading and unloading is accomplished by gravity. The chrome tonnage over this railroad for August will be 100% over July shipments.

R. L. Thompson, representing Seattle people, has taken an option on the Osgood placer mine, a mile south of Waldo. This property is owned by F. H. Osgood of Seattle. A shipment of 23 tons of the bedrock has been made to Seattle. It is said to be rich in gold and platinum.

A small crew is employed at the Neil-Success group of gold quartz mines on Fidlers gulch 7 miles west of Kerby preparing for the winter's run. The mine is operated by water-power. The property is under the direction of Fred Furth of Seattle. The group consists of the Neil and Mood properties, which have been producers, the ore being ground in arrastras. The underground works are extensive. A 50-ton rotary mill was recently installed on the properties. Water furnishes power from 4 to 6 months annually.

Grants Pass, August 14.

(Special Correspondence.)—More ore-bunkers are being built at Waters Creek, the terminus of the California & Oregon Coast railroad, to accommodate the increasing ore production from the Takilma district.

Grants Pass, August 20.

(Special Correspondence.)—W. C. Williams, representing the Chemical & Alloy Ores Co. of Cleveland, Ohio, is buying chrome ore, tungsten, and other minerals in this region.

E. A. McPherson of Grants Pass has uncovered a rich shoot of copper ore at the Old Crow mine in the Monumental district, owned by F. E. Bausman of San Francisco. The vein is 3½ ft. wide on a 100-ft. drift in porphyry, assays \$7 in gold, and \$4 in silver. Negotiation is being made for its sale to Eastern men.

It is rumored that the old Monumental, which has been idle for a number of years, will soon be operated again by Eastern capital. There is a large tonnage of ore running \$10 to \$40 in gold.

It is reported that the Monkey Creek mine is soon to be an antimony producer again.

The Diamond Creek cinnabar mine, owned by W. J. Ehrman, is being equipped with a furnace.

John Griffin, of Kerby, accompanied by J. C. Kendau and Ernest Rackliff of Reno, Nevada, recently inspected the Griffin cinnabar mines on Diamond creek, with a view to purchasing.

R. R. Horner, of the United States Bureau of Mines, has been in southern Oregon mines the past week. He is giving special attention to the black sand deposits.

Grants Pass, August 20.

#### MALHEUR COUNTY

A cinnabar discovery in the Owyhee desert has been made by T. H. Murphy and W. S. Brezt.

#### TEXAS

Buildings at a cost of \$175,000 are being erected for the Texas School of Mines at El Paso.

#### WYOMING

The United States government on October 10 next will offer for lease to the highest bidder 15,000 acres of land for oil and gas exploration at the superintendent's office of the Shoshone agency at Fort Washakie. All tracts are in 160-acre units. Leases will be made for 20 years; cash bonus per acre, 20% at time of sale and balance on notification of approval; cash rental \$1 per acre in advance; one-eighth royalty; drill and complete rig on each tract within one year; limit of 2500 acres to one buyer.

## Personal

*Note: The Editor invites members of the profession to send particulars of their work and appointments. This information is interesting to our readers.*

F. L. SIZER is in Arizona.

R. A. F. PENROSE is at Los Angeles.

CHARLES HARDY has been here from New York.

E. M. HAMILTON is on his way to Pachuca, Mexico.

JOHN J. CRAIG is in the training camp at Fort Riley, Kansas.

W. E. SIMPSON has returned to Cobalt from western Quebec.

H. KENTON BURCH has returned to Los Angeles from Arizona.

H. L. SMALL is in the training camp at Plattsburg, New York.

R. M. NICHOLS is in France 'with Uncle Sam,' we are informed.

E. H. GARY and D. C. JACKLING have returned to San Francisco.

JOHN W. MEECEER was in San Francisco last week, on his way to Arizona.

WADE L. LEWIS is with the 18th Regiment of Railway Engineers in France.

GEORGE S. BLAIR is at the Officers Training Camp near Chattanooga, Tennessee.

RALPH W. STONE, of the U. S. Geological Survey, was in San Francisco this week.

LOUIS DOUGLAS, son of JAMES S. DOUGLAS, has a commission in the Field Artillery.

NELSON DICKERMAN has returned to San Francisco from a visit to Placer county.

ALBERT L. WATERS has returned to Los Angeles from Detroit and Grand Rapids, Michigan.

T. S. DUNN is now captain in the 304th Regiment of Engineers at Camp Meade, Maryland.

F. R. WEEKES has been engaged in examination work in the Trout Lake district, British Columbia.

HARRY J. SHEAFE has been given a commission as captain of engineers and is now at Fort Leavenworth.

WILLIAM G. REYNOLDS has gone from Anchorage, Alaska, to the Officers Training Camp at Fort Sheridan, Illinois.

JAMES E. MOORE, lately at Goldfield, is now at the Reserve Officers Training Camp at the Presidio, San Francisco.

JAMES S. DOUGLAS sailed from New York on September 1, on his way to France, where he will work for the Red Cross.

BAYLIES C. CLARK, of Sutter Creek, has been appointed superintendent for the Globe Mines, in Trinity county, California.

HORATIO C. RAY has received a commission as first lieutenant in the Engineer Officers Reserve Corps and has been ordered to Washington.

H. H. NICHOLSON has resigned as superintendent for the Plinco Copper M. & M. Co. and is examining mines at Twin Lakes, Colorado.

HAROLD COGSWELL, formerly in Amador county, California, is now first lieutenant with the 316th Regiment of Engineers at American Lake, Washington.

F. N. NELSON, superintendent for the Colorado Fuel & Iron Co. in the Hanover-Fierro district, New Mexico, has completed his work and will leave for an extended vacation in Michigan and Minnesota.

The SAN FRANCISCO SECTION OF THE A. I. M. E. will meet on Tuesday, September 11, at the Engineers Club at the usual hour. A discussion on the labor problem in its relation to the mining engineer will be started by T. A. Rickard.

# THE METAL MARKET

## METAL PRICES

San Francisco, September 4

Aluminum-dust (100-lb. lots), per lb.	\$1.00
Aluminum-dust (ton lots), per lb.	\$0.95
Antimony, cents per pound.	17.00
Electrolytic copper, cents per pound.	28.50
Pig lead, cents per pound.	10.25—11.35
Platinum, soft and hard metal, respectively, per ounce.	\$105—111
Quicksilver, per flask of 75 lb.	\$115
Spelter, cents per pound.	10.5
Tin, cents per pound.	60
Zinc-dust, cents per pound.	20

## ORE PRICES

San Francisco, September 4

Antimony, 45% metal, per unit.	\$1.20
Chrome, 40% and over, free SiO <sub>2</sub> limit 8%, f.o.b. California per unit.	\$0.55—0.70
Magnetite, crude, per ton.	\$8.00—10.00
Tungsten, 60% WO <sub>3</sub> , per unit.	\$25.00—28.00
Molybdenite, per unit for MoS <sub>2</sub> contained.	\$40.00—45.00
Manganese, Carnegie schedule less freight to Chicago. Less than 40% special quotation.	

Manganese prices and specifications, as per the quotations of the Carnegie Steel Co. schedule of prices per ton of 2240 lb. for domestic manganese ore delivered, freight prepaid, at Pittsburgh, Pa., or Chicago, Ill. For ore containing

Above 49% metallic manganese	Per unit \$1.00
46 to 49% metallic manganese	0.98
43 to 46% metallic manganese	0.95
40 to 43% metallic manganese	0.90

Prices are based on ore containing not more than 8% silica nor more than 0.2% phosphorus, and are subject to deductions as follows: (1) for each 1% in excess of 8% silica, a deduction of 15c. per ton, fractions in proportion; (2) for each 0.02% in excess of 0.2% phosphorus, a deduction of 2c. per unit of manganese per ton, fractions in proportion; (3) ore containing less than 40% manganese, or more than 12% silica, or 0.225% phosphorus, subject to acceptance or refusal at buyer's option; settlements based on analysis of sample dried at 212° F., the percentage of moisture in the sample as taken to be deducted from the weight. Prices are subject to change without notice unless specially agreed upon.

## EASTERN METAL MARKET

(By wire from New York)

September 4.—Copper is dull, being nominal at 23.00 to 25.50c. Lead is quiet, prices being a little lower at 10.50 to 10.30c. Zinc is stagnant and prices nominal at 8.25c. all week. Platinum remains unchanged at \$105 for soft metal and \$111 for hard.

## SILVER

Below are given the average New York quotations, in cents per ounce, of fine silver.

Date	Average week ending

May	39.28	49.10	63.21
June	40.26	42.07	61.93

## ORES

Tungsten: Firmness characterizes the market with demand reported as good. High-grade concentrate, 60%, is held at \$23 to \$26 per unit with \$25 reported as paid. Ferro-tungsten is held at \$2.30 to \$2.60 per lb. of contained tungsten with both domestic and foreign demand excellent.

Molybdenum and antimony: There is no change in quotations. Molybdenum ore is scarce with \$2.10 to \$2.20 per lb. of MoS<sub>2</sub> asked for 90% concentrate. Antimony ore is also hard to get.

## PRICE FIXING AND TAXATION

The National City Bank of New York's September circular says in part: Price fixing and the new measures for taxation are still factors of uncertainty in business calculations. The authorities will closely supervise the movement of the wheat crop out of first hands, through the process of manufacturing into flour, and through distribution to consumption, determining the profit of every handler.

The price of coal has now been fixed by an order of the President, varying with the different fields. The price of steel is under inquiry and may be authoritatively fixed for government use. There is every reason to believe that the authorities will be guided in this policy by what they conceive to be the best interest of the public, and that they will seek to make prices that are fair to producers, but the whole policy is an experiment, and unless it is carried to extremes and the results are very pronounced, it will never be known whether the experiment is successful or not. It is not by any means certain that prices made artificially low are the most desirable. Prices have an important function in bringing supply and demand into equilibrium, adjusting them to each other.

The Senate still has the revenue bill under consideration, debating proposals to increase the levies upon incomes and profits. The advocates of extreme levies upon profits insist upon viewing book profits as cash in hand, but in the present condition of industry they are in actual use, and necessary in most cases to the effectual conduct of the industries. Bethlehem steel is now going to the public market with its securities, to raise money to carry on and enlarge its business. Enlargement of industrial capacity concerns the public as well as the proprietors, since war supplies are produced. The enlargements are made upon a level of costs probably 50% above normal, and nobody knows what these investments will be worth after the War. The profits which Senators are naming are in many instances paper profits, which stockholders have not seen and never will see, because the shrinkage in the value of inventories and plant investments will cause them to disappear.

A favorite argument for high taxes has been that the British government has exacted 80% of the profits in excess of pre-war level without unfavorable effects. Since this 80% rate has been in effect only a month it is too early to report on the effects.

## Eastern Metal Market

New York, August 29.

There is but one word with which to describe the condition into which all metal markets have fallen—stagnation. This was induced and perpetuated by the Government's policy of regulating prices and it will continue until definite adjustments occur as a result of known bases on which to proceed. Announcement of prices, at least of copper, are expected within a week or so. Quotations generally are nominal.

Copper is dead, lower and nominal.

Tin is quiet and largely nominal.

Lead is dull but steady.

Zinc is stagnant and lower.

Antimony is stationary and inactive.

Aluminum is weaker.

Government announcement of steel prices is known to be close at hand, but prices have receded slightly on their own account. At Pittsburgh active business has been done almost uniformly at the expense of prices. Plates have fallen to 8c. per pound, a decline of \$20 per net ton; bessemer and basic steel-making pig irons have declined \$2 and \$4 per ton respectively and in finished steel recent high prices have been decidedly reduced. The trade is at sea as to the extent to which the readjustment will go. At a recent important meeting with tin-plate makers in Washington the food administrator showed that there was an indicated shortage of about 2,000,000 boxes, with a greater one in prospect for 1918.

### COPPER

Inactivity could scarcely be more pronounced than the present state to which the market has fallen. The trade itself scarcely knows just where the market stands and inquiry among dealers is almost useless so far as ascertaining real basic conditions. No parallel to present dullness can be recalled. The entire situation is the result of uncertainty regarding the action of the most important factor in the situation—the Government, which will buy not only for itself but for its Allies as well. Various rumors have been let out to influence the market but without effect. One important rumor is to the effect that the Government's price will be close to 25c. and not less than 20c. per lb. It is mere guess, for no one knows. Events, however, are moving more rapidly and it is evident that a decision or an announcement is near. The appointment of a dictator for copper will probably be followed by definite news as to price. It is believed that cost data are sufficiently known to warrant a decision. Serious strikes out West cause a disturbing influence and the court decision against the Miami Copper Company in its flotation suit was a bear influence yesterday in copper stocks. Quotations are purely nominal and nearly guesswork. Yesterday both Lake and electrolytic were quoted at 26c., New York, for August and September delivery, with 24.50 to 25.50c. the quotation for last quarter. The London market continues unchanged at £137 for spot electrolytic and £133 for futures.

### TIN

Dullness, even more pronounced than in past weeks, pervades this market, and this is also true abroad. There is no desire to buy except where needs are vital. With Government uncertainties predominant, consumers are very cautious. Supplies of spot Straits tin seem light with the demand also light. An August 22, small sales, amounting to about 25 tons, were reported, some being offered as low as 61c., New York. More tin was offered than there were buyers. On August 23, there were sales of 50 tons of Straits tin at 61.75c., New York, but on the next day there was no business and no inquiry. On Monday of this week, August 27, the market was very dull with more sellers than buyers. Spot Banca tin was sold at

58.75c., New York, and there were also on that day fair sales of December shipment from the Straits at 56.62½c. Yesterday the market was lifeless. There was no inquiry except from dealers or consumers who desired information as to the state of the market. Yesterday Straits tin was quoted at 61.50c., New York, as compared with 61.37½c. on the 27th and 61.75c. on the 22nd and 23rd.

### LEAD

With the price of 8c. per lb. paid by the Government for its recent purchases still in the minds of consumers, it is not surprising that buying is at a low ebb. The market does not improve. Demand is less than at any previous time and prices have receded. Yesterday the New York quotation was 10.50c., with the St. Louis price at 10.40c. A continuation of the present inactive condition is looked for until definite action is taken by the Government. This is expected soon in all metals. Buyers are extremely cautious and the demand for manufactured goods is reported to have fallen off. The rather radical prices put on coal also tend to influence consumers of metals to expect lower prices. Yesterday the quotation in the outside market was 10.50c., New York, at which price small sales of carload lots were made. The price of the American Smelting & Refining Co. still stands at 11c., New York. Sales of re-sale carload lots of lead for September-October delivery are reported to have been made yesterday at 10.37½c., New York. Some interest has been taken in the first mid-year report of the U. S. Geological Survey, just issued, on the output of refined lead. This is put at 2,306,062 tons, or 20,495 tons in excess of one-half of the 1916 production. The increase is due almost entirely to a gain in the output of lead from foreign ores and bullion of 20,086 tons. Exports decreased 19,231 tons for the half year but the apparent domestic consumption is around 38,265 tons.

### ZINC

The market is 'very sick', as one dealer puts it; 'it has typhoid and other complications.' It is without life and stagnant, no one desiring to buy and no sales of any consequence being reported. One broker reports the sale of a carload at 7.75c., St. Louis, but in general transactions are so few that quotations are varied and there is no firm price fixing based on sales. They are entirely nominal and depend on the viewpoint of the holder or prospective purchaser. Some are holding firm to a quotation of 8.25 to 8.50c., St. Louis, or 8.50 to 8.75c., New York, while others are as low as 8.25c., St. Louis, or 8.25 to 8.50c., New York, for early delivery. Probably a fair average nominal quotation is 8.12c., St. Louis, or 8.37c., New York. Later or fourth quarter deliveries are from ¼ to ½c. per lb. higher. Any pressure exerted, as evidenced in the last week or so, has resulted in recessions and the market is in no condition to withstand it. Unless foreign buying in particular materializes, no great improvement is looked for and it is a matter of comment that Great Britain and France have been able to go so long without further purchases. Large buying is only slowly accumulating and will be in full swing ere many weeks. The removal of some of the Government and other uncertainties will clarify the situation.

### ALUMINUM

No. 1 virgin metal, 98 to 99% pure, continues inactive with the quotation now generally acknowledged as 47 to 49c. per lb., New York. The market is weak on re-sale offerings and no demand.

### ANTIMONY

The market is without interest and lifeless. Chinese and Japanese grades are held at 15 to 15.50c., New York, duty paid.

## Company Reports

### BUTTE & SUPERIOR MINING COMPANY

The net mining profit for the year amounted to \$8,792,131.23, to which is added miscellaneous income of \$81,314.62. That is equivalent to \$30.57 per share on the 290,197 shares outstanding at the close of the year. During the year two quarterly dividends of 75c. each per share and two of \$1.25 each were declared. In addition extra dividends amounting to \$4 per share were paid. The contract of the company with the American Zinc, Lead & Smelting Co. for the treatment of its concentrate at Caney and Dearing, Kansas, which was for two years, expired on March 27, 1917, and from that date shipments have been made to the American Metal Co. The former contract was based on the smelting only of the concentrate, the metal being sold by the Butte & Superior company, but the new contract is for the sale of the concentrate based upon current published market quotations. The price for spelter during the year 1916 was 12.63c. Development disclosed important extensions of the orebodies on practically all levels, from the 700 to the 1800-ft. Developments on the 1000, 1100, and 1300-ft. levels show a continuance of the orebodies easterly beyond the end-line of the Black Rock claim for a maximum distance of 500 ft., thus leading to the expectations that profitable orebodies may be found to the east of the ore-shoots on the 700, 800, and 900-ft. levels. On the 1500-ft. level a continuation of the orebodies disclosed above has been found. On the 1600-ft. orebodies of great width and of good grade have been exposed. These are practically continuous for a distance of 850 ft., varying from 16 to 65 ft. wide. The total development during the year was 10,845 ft. of driving, 4832 ft. of cross-cutting, 3015 ft. of raising, and 2649 ft. of shaft-sinking. The total length of underground workings amounts to 102,445 ft. The ore reserves are estimated at 1,044,850 tons containing an average of 17.7% zinc, and 5.65 oz. silver per ton. The ore mined and hoisted during 1916 was 626,803 tons, at an average cost of \$4.50 per ton, exclusive of taxes. The average content of the ore produced during the year was 15.55% zinc and 6.57 oz. silver per ton. The mill-recovery averaged 93.1% of the zinc content, being an increase of nearly one per cent over the results obtained in 1915. The principal additions to the mill consisted of further facilities for settling slime and concentrate, so as to recover a larger quantity of the mill-water; also the filtering plant was remodeled to admit of more economical handling of the increased tonnage. The metal content of the output is summarized as follows:

	Gold, oz.	Silver, oz.	Copper, lb.	Lead, lb.	Zinc, lb.
Zinc concentrate.....	5,539,600	3,699,950	1,861,713	9,955,691	181,624,842
Zinc concentrate, average assay.....	0.0323	21.544	0.542%	2.898%	52.876%
Lead concentrate, 5470 tons.....	226,734	150,060.70	38,556	4,099,977	1,523,363
Lead concentrate, average assay.....	0.0415	27.433	0.352%	37.477%	13.925%

### ESPERANZA LIMITED

The political conditions are reported to have been more satisfactory during the year 1916, although short stoppages of work were caused by strikes of the Mexican miners. The mill started in April and was operated continuously thereafter. The ore treated amounted to 113,921 dry metric tons, and the reserves on January 1, 1917, were 111,723 dry metric tons having an estimated content of 61,086 oz. gold, and 243,477 oz. silver. Development work amounting to 8900 ft. was done on the San Rafael vein and its branches on the upper levels. The ore reserves should yield a profit of about \$650,-

000 U. S. currency. The profit and loss account for 1916 shows a net return of £8412, to which is added a balance from the last account of £4818. Out of this an income tax was paid of £9638, and the balance of £3592 was carried forward.

### RAY CONSOLIDATED COPPER CO.

The report of operations for the second quarter of 1917 shows a total income of \$3,679,898, disbursement to stockholders \$1,577,179, and a net surplus of \$2,102,719. The total production was 22,255,598 lb., or an average of 7,418,533 lb. per month. During the quarter 892,200 tons of ore, averaging 1.66% copper, was milled. The recovery was 75.48%. On the sulphide mineral it was 85.23%. The underground development was 19,211 ft. The milling cost was 74.69c. and the mining 98.257c. per ton. The average cost of the copper was 11.272c. per pound. The quarter's profit is equivalent to \$2.33 per share on a selling-price of 27.562c. per pound of copper. The quarterly dividend amounted to \$1 per share; of this 50c. went to earnings and 50c. to capital distribution. Total dividends and capital distribution to the end of the quarter amount to \$12,085,458.

### CONSOLIDATED ARIZONA SMELTING CO

The annual report of the Consolidated Arizona Smelting Co. for the year ended December 31, 1916, shows the following:

At the Blue Bell mine, during the year, 4819 ft. of development work was done at a cost of \$13.11 per foot, or \$0.84 per ton of ore produced. This work developed 319,590 tons of ore at a cost of 20c. per ton of such new ore developed. The output of the Blue Bell mine was 75,070 tons of ore, containing an average of \$1.70 per ton in gold and silver, and 8.278% copper, which was a distinct improvement over the value of the ore in 1915. The cost of Blue Bell ore delivered at Humboldt was \$3.565 per ton.

At the De Soto mine a long cross-cut was extended west under the Whale outcrop, and a drift was run 252 ft. along the mineralized zone. The total development and exploration work amounted to 1814 ft., which cost \$17,301.40, or \$9.53 per foot. This was at the rate of 50c. per ton for ore produced during the year, and proved up 72,882 tons of new ore, against which the charge for development would be \$0.237 per ton. The De Soto production amounted to 34,382 tons of ore of an average value per ton of \$1.58 in gold and silver, and 3.375% copper. The De Soto ore is highly silicious and none of it is suitable for direct smelting. The sulphide ore concentrates readily, but the silicious ore from the upper levels, not being amenable to concentration, is used as converter lining and flux at the smelter. It is expected to produce 50,000 tons during 1917. The cost of delivery of ore at Humboldt was \$3.358

per ton, being about the same as that of the Blue Bell ore. The estimate of De Soto ore reserves at the beginning of 1917 was 103,500 tons available, containing \$1.50 per ton in gold and silver, and 3.2% copper.

The concentration mill treated 80,304 tons of ore during the year. The cost of milling, including flotation royalty, was \$1.51 per ton. A recovery of 80.3% of the gold, 79.9% of the silver, and 92.5% of the copper was made.

The ores now being mined come from the deeper levels of the mine and are generally more basic in character and contain a higher percentage of combined sulphides, but with less oxidation, hence a better recovery is obtainable, but a slightly

lower grade of concentrate results, with a lower ratio of concentration.

The smelter at Humboldt during the year smelted 103,748 tons of ore and concentrate, the production being 5972 oz. of gold, 150,012 oz. of silver, and 11,989,139 lb. of copper, which was about double the output of 1915. Of the above, 6,159,639 lb. of copper was produced from custom ores. The cost of receiving, crushing, tramming, storing, and sampling ores and concentrate amounted to \$0.539 per ton of material smelted. The cost of roasting and smelting to matte, including copper supervision and general charges, was \$3.944 per ton treated.

Value of copper, gold, and silver produced.....\$3,686,535.24  
Total cost of production ..... 2,813,770.53

Balance .....\$ 872,764.71  
Interest charges and mortgage bonds..... 13,750.00

Net operating profit .....\$ 859,014.71

## Mining Decisions

### OIL WITHDRAWALS—PRIOR DISCOVERY

When during the two weeks preceding the Presidential withdrawal of oil lands of May 6, 1914, oil locators had their property examined, made a lease, and the lessee made an agreement and ordered material for drilling wells on the premises, and thereafter pushed the wells to completion diligently at an expenditure of over \$22,000, the locators through their lessees were at the date of withdrawal "bona fide occupants" in the "diligent prosecution of work leading to the discovery of oil or gas," and were not affected by the withdrawal order. Affirmative testimony by the claimants that oil had been found in test wells in August, 1913, in such quantities as to justify further work toward discovery was given more weight than merely negative testimony of the government's witnesses to the effect that more than a year later no evidence of oil could be found in such test holes.

United States v. Ohio Oil Co. (Wyoming), 240 Federal, 996.  
January 31, 1917.

### OIL WITHDRAWALS—GROUP DEVELOPMENT THEORY

Locators of a group of oil placers made a contract for the exploration of one of their claims with a view to developing oil thereon, and if oil should be developed, to exploring the remaining claims in the group. Before oil was discovered on the first claim the withdrawal order of September, 1909, was made. The locators claimed that the work being done on the first claim was for the benefit of the remaining locations, and that they should be protected as persons who were at the date of the order "in diligent prosecution of work leading to discovery of oil or gas." Held, that the group development theory applies only to annual assessment work done after a discovery is made and the location perfected, and that the claims on which work was not actually being done at the date of the order were thereby withdrawn.

United States v. Stockton Midway Oil Co. (California),  
240 Federal, 1006. January 5, 1917.

### OIL LEASE—DIVISION OF ROYALTIES

When several owners of adjoining tracts unite in a single lease thereof to a third party for oil and gas purposes, royalties must be divided in the proportion that the area of the tract owned by each co-lessor bears to the total tract leased, regardless of the ownership of the tract or tracts upon which the wells are actually drilled.

Lynch v. Davis (West Virginia), 92 South-eastern, 427.  
May 22, 1917.

## Recent Publications

ANNUAL YEAR BOOK OF THE MICHIGAN COLLEGE OF MINES, Houghton, Michigan. A catalogue of information with courses.

PHOSPHATE ROCK IN 1916. Mineral Resources of the U. S., 1916. Part 11, pp. 29-41; published August 13, 1917; prepared by Ralph W. Stone.

SLATE IN 1916. Mineral Resources of the U. S., 1916. Part II, pp. 61-72; published August 11, 1917; prepared by G. F. Loughlin.

THE COAL FIELDS AND COAL INDUSTRY OF EASTERN CANADA. By Francis W. Gray. Bulletin No. 14, of the Department of Mines of Canada, Mines Branch. Pp. 67. Ill., pocket-map, and index.

This publication gives a general description of the coal-fields, the mines, and plants. Also a geological and historical, as well as economic description of the coal regions of eastern Canada.

THE IRON-ORE DEPOSITS OF VANCOUVER AND TEXAS ISLANDS. By W. M. Brewer. Bureau of Mines report, Bulletin No. 3 of the British Columbia Department of Mines. Pp. 41. Maps and sketches. Victoria, B. C., 1917.

This report deals with the history, bibliography, geography, topography, and geology of the iron-ore deposits on the islands off the mainland of British Columbia. It describes the numerous deposits, the character of the ores, and makes an estimate of the amount of ore available—about 13,000,000 tons.

'THE CANADIAN MINING MANUAL', 1916-1917. Edited by Reginald E. Hore. Mines Publishing Co., Toronto. 445 pp. Ill. Price, \$3.

This is the year-book published by the 'Canadian Mining Journal', of which the author is editor. The book is what it pretends to be: a trustworthy compilation of information concerning mining enterprises in Canada. Besides giving necessary details concerning mining companies operating in the Dominion, it furnishes reliable information concerning the various mineral products of the country, the distribution of the metals, with maps and other illustrations, including a number of portraits of the leading mine managers. It is an attractive and useful volume.

# INDUSTRIAL PROGRESS

*Information furnished by manufacturers*

## Outdoor Metering Outfits

Power companies operating high-voltage transmission-lines have found that a watt-hour meter and transformer outfit combined in a unit, and adapted for outdoor service, can be used to great advantage both from the standpoint of initial cost and of maintenance where not advisable to build a complete sub-station. The outfits made by the General Electric Co. and described in bulletin No. 46251-B have been designed especially for this service, and compact units for such service. They are adapted for use in outdoor sub-stations for measur-

TRANSFORMER WITH ATTACHED METERING OUTFIT

ing the amount of power supplied to the various feeders. Where the feeders are run directly from a transmission-line at intermediate points, the voltage of feeders and transmission-line being the same, they furnish a satisfactory method of measuring the power supplied to each. They may be furnished for either single or polyphase circuits to operate any usual meter-combination; they consist essentially of the required meters with the necessary instrument transformer-elements. These elements are modifications of standard switchboard transformers, thus maintaining the General Electric Co.'s standard. All parts are mounted in weather-proof housings with two compartments, one for the transformers and one for the meters. The standard outfits are for 3-wire 3-phase circuits and are equipped with a watt-hour meter only.

To install this outfit it is necessary only to connect the high-

tension lines to the high-tension leads, install and connect the meter, and it is ready for service. High-tension bushings are probably the most vulnerable points in the insulation of all electrical apparatus. For a 3-phase outdoor metering outfit but three of these bushings are required, thus reducing the possibility of trouble from line-disturbances to the minimum. The transformer-elements are readily accessible for repairs, and it is quite feasible to carry an extra element in stock. In case of a burn-out the spare element can be immediately installed.

The large door extending across the entire front of the meter-compartment renders the meter and connections accessible for inspection and testing. A lamp-socket with a two-way snap-switch is provided so that a standard incandescent lamp may be connected across the secondary of either potential transformer-element to facilitate inspection and testing.

For safety in transportation, the high-tension leads are often removed from the outfit and packed separately. These leads should be handled with care. Although substantial enough for the purpose for which they are intended, they may be injured by a blow or jar. In order to re-assemble the leads, it is necessary first to remove the outfit from the tank. To do this, remove the nuts or bolts that hold the cover to the tank and lift the cover and internal suspended parts by means of the eye-bolts in the cover. The current-transformer high-tension leads are numbered on the assembly-diagram shipped with the outfit and their supports and the respective holes in which they are to be assembled are similarly numbered. These leads should be assembled on the outfit so that the marks on their supports coincide with the corresponding marks on the cover. If the outfit is rated for two currents or two potentials, or both, the meters shipped with the outfit will have the proper calibration and adjustment for direct readings when the metering outfit is connected for the same current and potential ratios as are marked on the meter name-plate. If it is desired to operate the outfit with connections different from those above mentioned, it will be necessary to use a constant obtained by dividing the actual transformer ratio by the ratio marked on the meter name-plate. For example, suppose that the outfit is rated 11,000/22,000 volts, 5/10 amperes, and that the meter is rated 11,000 volts, 10 amperes: the current-ratio of the outfit would be 1 or 2 to 1 and the potential ratio would be 100 or 200 to 1. The meter would be marked for a current ratio of 2 to 1 and a potential ratio of 100 to 1. The possible conditions of operation with their proper constants are as follows:

Current transformers		Potential transformers		
Primary current	Ratio	Primary voltage	Ratio	K
5	1 to 1	11,000	100 to 1	1:2 = 0.5
5	1 to 1	22,000	200 to 1	(1:2) (200:100) = 1.0
10	2 to 1	11,000	100 to 1	1.0
10	2 to 1	22,000	200 to 1	200:100 = 2

The correct current or potential connections may be obtained by referring to the diagram of internal connections shipped with the outfit. Provision is made within the metering compartment for short circuiting the secondaries of the current-transformers in case it is desired to disturb the meter-connections while the outfit is connected in circuit. In case it is desired to connect to the outfit meters other than those shipped

with it, the same rules will apply as when connecting to separate transformers.

### Johnson-Mckay Quicksilver Furnace

The Johnson-McKay furnace consists of a battery of 12 retort pipes, each 12 in. diam. A less number of pipes may be used if desired. Also the retort pipes can be made 10 in. diam., but the standard size of furnace is better. The iron-work for the standard furnace consists of the following:

- 12 cast-iron retort pipes, 12 in. diam. by 6 ft. 5½ in. long.
- 14 cast-iron inside covers.
- 12 cast-iron outside covers.
- 12 cast-iron condenser pipes, 3 in. by 8 ft.
- 1 cast-iron furnace front with anchor bolts.
- 1 cast-iron stack-plate.
- 1 smokestack, 12 in. diam. by 20 ft. long.

Necessary frame rods, scrapers, and chargers are also supplied.

The approximate weight is 9100 lb. For the setting of the standard furnace the following list of bricks, lime, cement, and lumber will be required.

- 6000 common red brick.
- 1300 common fire-brick.
- 200 arch fire-brick.
- 10 bbl. lime.
- 1 bbl. cement.
- 3½ cu. yd. sand.
- 2 sacks fire-clay.
- 8 pieces 4 by 6 in. by 7 ft. 8 in., Oregon pine for frame.
- 12 pieces 4 by 6 in. by 3 ft. 6 in., Oregon pine for frame.
- 6 pieces 2 by 6 in. by 6 ft. 8 in., Oregon pine for frame.
- 2 pieces 2 by 12 in. by 16 ft., Oregon pine for frame.
- 3 pieces 2 by 12 in. by 16 ft., Oregon pine for trough.
- 2 pieces 1 by 12 in., by 16 ft., Oregon pine for trough.

Any number of pipes could be used, but one could not operate so economically with a few pipes as with the standard equipment. Based on a 12-hour roasting period for each charge of ore, the operation of the standard furnace is continuous, since one pipe is unloaded and re-charged every hour. When the pipes are sufficiently heated, the first pipe is charged, and then one pipe every consecutive hour until all have been charged. By that time the ore in the first pipe will have roasted 12 hours, at the end of which period it is ready for unloading and a fresh charge put in its place. At the end of the next hour, the second pipe would be unloaded and re-charged, and so on indefinitely.

As the ore is heated the quicksilver volatilizes and thus separates from the gangue. It then passes to the condenser-pipes, and thence the condensed mercury drains to the water-filled trough at the rear of the furnace, where it is collected. The cycle of operations described is based on a 12-hour roasting period for each charge of ore, but the length of the roasting period may vary. That depends on the character of the ore, the intensity of the heat maintained in the furnace, the experience of the attendant, and other factors. The standard size of furnace should treat from 3 to 5 tons daily. Some users have treated as many as 7 tons per 24 hours. Using wood for fuel, the consumption is from 1½ to 1¾ cords per day.

### Oxy-Acetylene in War Time

New machinery and other metal equipment will be increasingly difficult to obtain on account of the War, and it becomes not only a necessity but a patriotic duty for every manufacturer to utilize the equipment on hand, and that involves reclaiming for service the broken and worn machinery and parts that otherwise would be consigned to the scrap-pile. While manufacturers are clamoring for machinery and replacements, thousands of the very pieces needed have been thrown into

junk-heaps merely because they have a break, a crack, or a worn spot. A large part of this equipment can be restored for service quickly and at a trifling cost by oxy-acetylene welding. The Prest-O-lite Co., Inc., is conducting a nation-wide campaign to extend the use of this method of recovering waste equipment. Not only will it save money, but it is a practical way of avoiding costly delays.

### Commercial Paragraphs

C. S. Vought, assistant general manager of sales for the AMERICAN STEEL EXPORT Co., New York, sailed for France on August 7, on business for his company. He will be absent about sixty days.

THE CONCRETE HIGHWAY MAGAZINE for August, published by the Portland Cement Association, is an exceedingly attractive number. In addition to informing articles on concrete roads, including the New York State highways, it deals with the construction of a 3000-ton concrete motor-ship.

AN ERADICATOR of india ink, known as 'Rasindia' has recently been placed on the market. It is guaranteed by the makers to remove all marks from tracing cloth without injury to the cloth. It is claimed that 'Rasindia' is the only india ink eradicator which will not leave marks or stains of any kind upon the cloth.

THE LINK-BELT Co. of Washington is the new name of the Link-Belt & Dodge Products Co. The headquarters are at 574 First Avenue South, Seattle, Wash. The company moved to the new offices recently owing to increasing business and the need of better facilities. The office at Portland, Oregon, has been moved to First and Stark, which is better adapted to take care of the business in that city. The Link-Belt Co. of Washington has been able to replenish its stocks in spite of the extraordinary pressure of orders. In addition to the Link-Belt products the company handles the entire transmission line of the Dodge Sales & Engineering Co. L. W. Shirley is manager of the Link-Belt Co. of Washington.

The Camp Bird, Ltd., of Ouray, Colorado, has discontinued the use of all its surface equipment and this material has been sold to the MORSE BROS. MACHINERY & SUPPLY Co. at Denver. The new tunnel of the Camp Bird Co., which is being driven to reach the veins at lower depth, releases all of this valuable equipment. The famous Tom Walsh hardwood-floor boarding house, with accommodations for 400 men, as well as the surface equipment, and a 10,000-ft. aerial tramway, are included in the sale. The same machinery dealers have bought the smelter and equipment at Alma, Colorado, installed by the Colorado Smelting Co. in 1914. This plant ran about three months, and included a 200-ton plant for smelting copper matte with usual accessory equipment. The dismantling of the Junta mill at Telluride has been completed by the Morse Bros. company and 20 carloads of material has been shipped to Denver. This plant was in operation only three weeks.

### Oronite Enamel Paint

Manufacturers of clay products, and particularly brick manufacturers, have experienced difficulty in obtaining a protective coating for the steel cars used in conveying the fresh brick through the dry-tunnels prior to burning. Comparatively high temperatures are maintained in these tunnels, to which the cars are subjected from two to four days. The moisture and heat cause rapid deterioration of the metal surfaces of the cars. Oronite enamel paint has successfully been used to meet these severe conditions by protecting the metal surfaces from the action of the hot vapor. One method is to dip the entire car in a vat containing the Oronite paint, although it may be applied by a brush.

	Page
<b>EDITORIAL</b>	
NOTES .....	373
SILVER .....	374
The recent rise in price and the causes of it. Statistics of the world's production during the last 20 years. The decreased yield of Mexico and the increase from Canada. The effect upon individual mines. Silver as a by-product in base-metal mining. M. & S. P., September 15, 1917.	
GEOLOGIC ECCENTRICITIES .....	375
Comment on the article in this issue by Professor Patton. The bonanzas of the Cresson mine and others of a similar kind in the Cripple Creek district. The fumarolic vents of the Bull Domingo and Barrick mines, at Silver Cliff, in Colorado. Nature does not work uniformly. Search for such rich masses of ore. M. & S. P., September 15, 1917.	
NEAR-ORE—A NEW TERM.....	376
Need of a term to express lode-matter or vein-filling that cannot be exploited at a profit, and therefore is not 'ore' in the strict sense of the term, but that may become profitable under more favorable conditions. M. & S. P., September 15, 1917.	
<b>DISCUSSION</b>	
COLORADO SCHOOL OF MINES.	
By C. M. Ege .....	377
An alumnus of the School writes from the Philippines to support a recent editorial on the fiasco of last May. Lack of discipline among the students, a weak board of trustees, and a faculty that did not have a fair show. M. & S. P., September 15, 1917.	
BLOCK-STOPING AND TIMBERING IN DEEP PLACER-MINING.	
By E. E. Fleming .....	378
Description of methods of exploiting a deep alluvial channel near Nome, in Alaska. Block-stopping of the gravel. M. & S. P., September 15, 1917.	
SAMPLING OF LARGE LOW-GRADE OREBODIES.	
By John B. Hastings .....	379
A veteran engineer contributes to the previous discussion of the subject. Sampling of the Butte & Superior mines. Method used in the Centre Star and War Eagle mines. M. & S. P., September 15, 1917.	

## ARTICLES

THE CRESSON BONANZAS, AT CRIPPLE CREEK.	
By Horace B. Patton .....	381
A descriptive account of the unusual occurrences of rich gold ore discovered in a famous mine at Cripple	

Creek. An extraordinary cavity lined with telluride ore. The author is professor of geology in the Colorado School of Mines. M. & S. P., September 15, 1917.	
FINANCIAL ASSISTANCE TO FAMILIES OF SOLDIERS AND SAILORS .....	385
An alternative to the pension system. Provision for our fighters. Secretary McAdoo's suggestions. M. & S. P., September 15, 1917.	
PURITY OF SELECTED COPPER MADE IN CONVERTERS.	
By Henry F. Collins.....	386
A note on copper-smelting practice in Spain by an experienced metallurgist and recognized authority. M. & S. P., September 15, 1917.	
CYANIDATION OF FLOTATION CONCENTRATE.	
By James G. Parmelee.....	387
Timely notes on an important phase of the flotation process by a metallurgist in British Columbia. Effect of oil. Removal of oil. Solvents for oil. Results of cyaniding flotation concentrate. M. & S. P., September 15, 1917.	
DETERMINATION OF TUNGSTEN .....	389
A note by a Cornish metallurgist. M. & S. P. September 15, 1917.	
SIMPLE METHODS OF FINDING DENSITY AND WEIGHT OF SOLIDS IN MILL-PULP.	
By R. B. Kiliani .....	390
A note by a metallurgist experienced in cyanidation. A formula, and the use of it. M. & S. P., September 15, 1917.	
GRAPHITE.	
By L. W. Brooks.....	391
A comprehensive review of the technology of this mineral. Production and distribution. The uses for graphite. M. & S. P., September 15, 1917.	
A USEFUL CHART .....	395
M. & S. P., September 15, 1917.

*Leading Metal Mines find G-E Equipment is reliable and economical*

## Inevitably—you will electrify

**S**OONER OR LATER the advantages of G-E MOTOR DRIVE are going to become so apparent, that you will ask our Engineering Organization to study the conditions and requirements of your plant — just as the owners of the equipment here illustrated asked us to do.

For of course you want to know how you can cut the costs of production—how you can save on your POWER costs—how you can increase the QUALITY of your output, and how you can increase its QUANTITY.

In every field of activity where power is used, transmitted or generated, the trademark of G-E Initiative and Quality is found. In power stations of far-off mountains you will find G-E apparatus built to meet the special need. You will find the "G-E" trade-mark on the electrical equipment of the Panama Canal and on the locomotives which tow the ships

through. The electrification of the railways which carry the commerce of the nation east and west across the Rockies is a tribute to G-E engineering skill. Manufacturing plants, large and small, in all sections of the country, enjoy marked advantages in production over their competitors because the General Electric Company has solved their power problems. All that has been learned in each individual field of electrical endeavor is transmitted through the great Research Laboratories of the company to its engineers in all departments, so that in the solving of your problems you may have the benefit of all the knowledge and experience that has gone before.

And because the General Electric Company possesses specific, definite knowledge of all the intricacies, puzzles and problems of industrial power, and applies to their solution the knowledge which no other organization can boast, G-E service is the greatest guarantee of results that you can possibly have. The organization and resources of the General Electric Company stand squarely behind every G-E MOTOR DRIVE to insure satisfactory operation.

T. A. RICKARD, Editor

**H**OW the members of our profession are responding to the call to arms is indicated by the list of the members of the Institute now in military service as given in the current bulletin of the society. The list could be much enlarged by obtaining the names of members that have been fighting with our Allies during the earlier stage of the War.

**J**UST before the War the German government endeavored to persuade the British government to intervene jointly in Mexico, but the suggestion was declined, asserts Mr. James Keeley, editor of the Chicago 'Herald.' During the Spanish-American war Germany organized an effort to aid Spain against the United States and it was England that killed the scheme. We hope to see Mexico restored to order by aid of the United States without the help, but with the goodwill, of England and France.

**D**ISCREPANT prices for chrome ore are caused, in large part, by the different uses to which this mineral product is put. Three classes of ore are recognizable: (1) that assaying 40 to 45% is used by the manufacturers of steel and of refractory materials, (2) that assaying not less than 48% is used in the manufacture of chemicals, and (3) that assaying 51% or more is used for special chemicals, such as the bichromates of potash and soda. There is plenty of the low-grade chrome ore, which therefore is cheap; there is a scarcity of ore assaying 51%, and therefore it is costly. Another factor in making prices is the reliability of the seller; many buyers have discovered to their loss that supposed producers of chrome failed to 'deliver the goods' after receiving a payment on account.

**S**PEEDY re-opening of mines in Chihuahua is expected by General Francisco Marguía, now that protection against Villa's depredations is assured. But the General says nothing about Carranza's official depredations on the mines, in the form of taxation and requisitions of a most burdensome kind. Perhaps the Carranza government will acquire better manners as the need of a loan becomes felt increasingly. Persistent rumors come from New York that a Mexican loan of \$150,000,000—dollars, not pesos—is requested. But Carranza has suspended the constitution that he claimed to be defending, and Mexico is today under the uncertain control of a pompous dictator. He has decreed that no transfers or deeds to property can be made to aliens unless they renounce their citizenship rights and thereby lose the protection of their own flag—whatever it may be worth. Unfortunately no healthy opposition to Car-

ranza exists in Mexico today, only bands of wandering bandits; but cartridges and munitions of war generally are becoming scarce, so that the confusion of misrule is becoming abated. Carranza's violent friendship for German propagandists and exploiters is waning and he may find it useful to make friends with Uncle Sam in order to borrow a little money, on conditions.

**C**ALIFORNIA's mineral resources are playing an important part in the organized industry of the War. The State Mineralogist, Mr. Fletcher Hamilton, and the staff of the Mining Bureau are aiding the consumers of useful minerals by supplying information concerning the localities of supply within the State. It ought to be known to the public that one of the best sources of information in all matters relating to the occurrence and distribution of minerals in California is the office of the Bureau in the Ferry building, at the gateway of San Francisco. Another invaluable agency for the dissemination of such information is the office of the U. S. Geological Survey, in the Custom House building, where Mr. Charles G. Yale is ever ready to assist the investigator and operator of mines.

**P**RODUCTION of copper decreased 50 million pounds in July, owing chiefly to the cessation of production at the Inspiration, Miami, Arizona Copper, Old Dominion, Shannon, East Butte, and Greene-Cananea mines. It is noteworthy that the New Cordelia began to produce in June, and in July yielded 2,100,000 pounds. The Mason Valley and the Ohio copper companies have resumed production this year and are getting into their stride—not a 7-league gait, but sufficiently rapid to make a considerable contribution of copper. The wonderful little United Verde Extension mine yielded 33,548,000 pounds in the first seven months of this year. Apparently the consumption of blister copper has been greater than the capacity of the refineries, so that the recent decrease in blister copper is not an unmitigated evil.

**O**N another page we publish a statement made by Mr. Henry D. Williams, chief counsel for Minerals Separation, in the course of which he tells the public what his clients expect to get out of their claims against sundry alleged infringers of their patents. This statement is interesting and that is why we print it. Such as it is, it shows what Minerals Separation expects to get out of the American metal-mining industry. We hope the expectation will not be fulfilled, for it would represent a depressing burden on useful enterprise. Mr. Williams has very little to say about the appeal in the Butte & Superior case. This will come before the court of the

Ninth Circuit, in San Francisco, the court that gave a decision against Minerals Separation in the Hyde case. No reason exists for believing that Judge Bourquin's decision in the Butte & Superior case will not be reversed in San Francisco. The litigation is not so near an end as Mr. Williams so confidently anticipates.

**M**AGNOLIUM is the name given by British and American experts to a metal that is an alloy of magnesium, aluminum, and other elements. It is a war discovery. When one of the zeppelins brought to earth in England was examined it was remarked that it had a framework remarkably flimsy for a machine that had carried over four tons in men and material. Upon further examination it was ascertained that the framework was made of a metal of unusual strength and lightness. It was four times lighter and yet four times stronger than the best steel. The analysis was sent to the United States and the metal is now being made for the manufacture of American aeroplanes. A few days ago we held a piece of it—about the size of a pill-box, being a section from a rod of the metal—and it was so light as to induce the illusion that it must be hollow. The magnesium that it contained was derived from Californian magnesite.

**U**NDER 'Discussion' we publish three interesting contributions. Mr. C. M. Eye writes from the Philippines to express his opinion concerning the Colorado School of Mines fiasco. As an alumnus of the School he has no liking for an unnecessary ventilation of the scandal, but he is impelled to express agreement with the conclusions previously published in these columns. Before now he will have learned that Mr. Parmelee is no longer President of the School and he will learn shortly of the manner in which the Golden trustee has been permitted to make confusion worse confounded. The one certain cure for these deplorable conditions is to place the governance of the School more in the hands of its alumni and less in the hands of small politicians, newspaper reporters, and other people wholly unfit to act as the directors of an educational institution. The next letter, from Mr. E. E. Fleming, who writes from Alaska, adds to the value of Mr. Harold Power's recent article by furnishing interesting comment on deep-placer mining and by giving details of practice in the Nome district. The third contribution comes from Mr. John B. Hastings, an old friend of ours, a veteran engineer, to whom the word 'sampling' is as the smoke of battle to an old warrior. His remarks on the subject will be much appreciated, more particularly the description of the method of sampling introduced by him in the Centre Star and War Eagle mines at Rossland.

**I**NCIDENCE of taxation on excess profits is causing amateur economists in London, as in New York, to realize sundry fundamental truths in mining finance, for instance, that a mine is a wasting asset and that dividends represent, in large part, only a return of capital. Discussion has arisen regarding the taxing of

the profit earned by the two South American subsidiary enterprises of the Oroville Dredging Company, to which we referred in our issue of August 18. Both of these subsidiary companies, the Pato and the Nechi, began to produce gold after the War began, so that the profit made now is compared with the absence of profit in 1913, when these undertakings were in their development stage. If all the profit now declared is to be regarded as 'excess,' an injustice will be done. Therefore the directors are endeavoring to make an equitable arrangement with the Government. Again, the tin-dredging companies on the Malay peninsula are benefiting from the rise in the price of the metal that they produce. It has been suggested that the gain due to the increase in the price of tin should go to the financing of the War, after making deductions for the extra freight-rate, insurance, and other increased expenses caused by the War. In Nigeria, where likewise dredging supplements sluicing operations, an arbitrary figure of 13% was fixed as a reasonable profit. What should be the reasonable profit from dredging operations? Such metal-bearing ground is more clearly a wasting asset than even a vein deposit, because the latter affords promise or prospects in depth, whereas the resources of an alluvial deposit are usually known fully at the start and any change from the original estimate of returns is commonly on the wrong side. We would regard 20% as a proper return on a dredging enterprise, that is, we would regard it as a poor 'investment' if it failed to yield that much.

## Silver

Silver is nearing the dollar mark. The latest quotation—96½ cents per ounce—is the highest since 1893, when the Indian mints were closed to free coinage, but it is by no means the highest since the Civil War, as has been asserted by careless commentators. During that war the price was fairly steady at about \$1.34 and it was not until 1885 that it fell below the dollar, rising subsequently as high as \$1.21 in 1890, when the Sherman Act authorized the purchase of 4,500,000 ounces per month so long as the price did not exceed \$1.2929 per ounce. The repeal of that Act and the closing of the Indian mints started a debacle that culminated on July 29, 1915, when the price reached 46.87 cents. During the 20 years preceding 1916 the price averaged 58 cents and in 1916 it was 65.78. Between the low figure of two years ago and the present quotation there is an advance of 50 cents or slightly more than 100%. Even the recent high quotation does not reflect the whole advance, for a premium of as much as 4½% has been paid, at Toronto, on purchase of the metal. Here, in San Francisco, a premium of 4 cents per ounce has been paid on purchases for export to China. This condition of the market is due to causes that are recognized. Not only has the production decreased, but a growing demand has been created by the War. Twenty years ago the world's production of silver was 186,000,000 ounces, of which the

United States contributed 58,500,000 ounces and Mexico 41,400,000. In 1916 the world's total was 172,400,000 ounces, of which the United States contributed 72,800,000 and Mexico 35,000,000. Thus at the end of the 20-year period the production was actually less than at the beginning, this being due chiefly to the disorderly condition of Mexico, where production declined from the maximum of 87,000,000 ounces in 1911 to 35,000,000 ounces last year. In 1911 the world's production was at its highest, namely, 254,214,000 ounces. During the 20-year period the United States has shown a steady increase in production, the ratio of her yield to the world total increasing from 37 to 42%. Since 1905 Canada has become an important source of supply. Whereas in 1896 Canada produced only 3,200,000 ounces, in 1916 she produced 25,500,000 ounces. The outstanding fact, however, is the collapse of silver mining in Mexico, which now produces only 40% of her previous maximum. Turning from supply to demand, it is noteworthy that the United States exported \$53,172,000 worth of silver in the fiscal year 1916, of which \$41,032,000 went to England, mostly for re-shipment to China and India. In 11 months of the current fiscal year the United States has exported \$75,000,000 worth. The need of silver coinage among the European belligerents and the expansion of trade in the Far East were the principal factors in improving the market for silver; more recently the declaration of war by China has intensified the normal drift of the metal to that country. In face of these growing demands there is a decrease of production; therefore the high price is fully explained. What it means to the fortunate producers of silver is indicated by a few individual statistics of production:

	Production last year oz.	Increased profit at 96 cents per ounce
Anaconda .....	10,624,747	\$3,187,424
Butte & Superior.....	4,126,938	1,238,081
Bunker Hill & Sullivan.....	1,910,281	573,084
Kerr Lake .....	2,036,962	611,098
Nipissing .....	4,044,668	1,213,400
Tonopah .....	1,387,557	416,267

Of these, one is a copper mine, one a zinc-lead mine, another a silver-lead producer, and the other three yield plain silver ores. Most of them produce some gold also. The copper ores of Montana average \$1.05 per ton in gold and silver, those of Nevada 44 cents, and those of Arizona 42 cents per ton. The lead ores of Utah yield an average of \$9.23 per ton in the precious metals, and those of Idaho \$3.03. Whereas the production of silver used to come mainly from silver-lead ores, an increasing proportion is now being won as a by-product in the course of copper mining, and in periods marked by a highly favorable copper market this silver is a clear gain. In normal times two-thirds of the silver production of the world is consumed in the arts. Now an abnormal proportion is being used for silver coinage, for the convenience of paying the soldiers of the big armies and for replacing the gold that is being hoarded by governments

of the belligerent countries. India continues to be a sink for silver; that country absorbs fully half of the world's output. The cinema trade is consuming an increasing proportion of silver. Altogether the outlook is sufficient to prompt renewed search for deposits of the metal. Idle mines and old dumps should invite examination in the light of these improved conditions, for, although labor and cyanide are high, the market for the associated base metals is also favorable.

## Geologic Eccentricities

In this issue we publish an interesting article by Mr. Horace B. Patton, Professor of Geology in the Colorado School of Mines, describing the peculiar occurrences of extremely rich ore uncovered in the Cresson mine at Cripple Creek. This is accompanied by such an outline of the local geologic conditions as will afford evidence upon which other experienced observers can form their own hypotheses to explain the eccentricity of ore deposition. The present writer happens to have visited the Cresson mine and is in a position to appreciate Professor Patton's description of the two bonanzas discovered previously to May this year. The dominant structural feature on the 1200-ft. level is a line of fracture that follows a dike of basalt, two to four feet wide, which has been traced from the surface downward. This dike in its passage through the andesite-breccia is accompanied by a distinct selvage, but the extent of the dislocation caused by the dike is not measurable. The distribution of the orebodies discovered in the mine appears also to be related to basalt dikes. On the 1200-ft. level a mass of broken rounded fragments of basalt adjoins the main line of fracture and there is the suggestion of a volcanic vent. Vugs are numerous. One of them is a pear-shaped chamber 50 feet high and 35 feet in greatest width. This cavity, according to Mr. Richard Roelofs, the able manager of the mine, was filled to a depth of ten feet with fine particles of ore, and the walls were encrusted with two feet of rich ore consisting of quartz and calaverite, much of it in beautiful crystals. The telluride extended into the wall-rock, but the vug itself constituted the core of the orebody. From this curious cavity \$1,250,000 worth of ore was removed, most of it being screened and sacked without further sorting or concentration. The orebody was found to extend irregularly alongside the dike up to the 300-ft. level, but it did not reach the surface and therefore had no outcrop. On the 600-ft. level the ore was on the east side of the dike, changing to the west side at about 1100 feet from surface. The quartz in the vug was agatized and sintery. This peculiar orebody has several points of similarity with that uncovered in the Anna Lee claim of the Portland mine. It is in the same dike, which in the Portland ground is of the same thickness, namely two to four feet. The Anna Lee 'chimney,' according to Mr. R. A. F. Penrose, was 12 to 15 feet in diameter and reached from the surface to 875 feet in depth. It was nearly vertical. The rock was intensely kaolinized and brecciated; Mr. Penrose consid-

ered it to be "the neck of a hot spring or fumarole." Two other extraordinary enrichments of possibly analogous origin in the Cripple Creek district may be mentioned: the Klondike Stope at 700 feet in the Portland and the Jewel Chamber at 400 feet in the Independence mine. Ore deposits of this type were described by S. F. Emmons in his report on the Silver Cliff district. There the Bull Domingo mine had an irregular chimney identified with a volcanic neck of brecciated rock, the ore consisting of concentric shells of silver-bearing galena, blende, and various spars, encrusting fragments of different kinds of rock torn by violent thermal eruption and filling a vent, 40 by 100 feet in horizontal section, traversing syenite. Another equally remarkable deposit was found in the adjacent Bassick mine. This was a vertical chimney of agglomerate, mainly andesite, within a similar agglomerate. In cross-section the shape was elliptical, the two dimensions being 30 by 100 feet. Gold and silver were contained in concentric shells of sulphides—of lead, zinc, antimony, copper, and iron—covering fragments of rock of varying size, up to three feet in diameter. Emmons came to the conclusion that the deposit marked a dying phase of volcanic activity, that the agglomerate occupied "the neck or crater of an old volcano," and that the precipitation of valuable minerals was due to fumaroles, or gaseous emanations. Such eccentric orebodies suggest that geologic action occasionally departs from the uniformitarian processes on which our theories are largely based and that the scientific observer must leave place for catastrophic ideas in his interpretation of nature. Of course, the activities by which such results are achieved are on a scale relatively small as compared with the major movements of geologic development, but they are an essential part of the great work that has made the earth's crust as we now find it. Turning to the economic phase of the subject, it is well to note that the remarkable orebodies in the Cresson mine gave no signs of their position to the prospector, for no outcrop existed. The ore was found by exploration underground, itself started on such vague indications as are plentiful in a mineralized area like that of Cripple Creek. This suggests that diamond-drilling on a systematic scale, or some similar method of research, should be tried in such districts, for it requires but little imagination to see that the finding of ore at best is haphazard. The experienced miner will say, quite properly, that to seek for a small mass of such ore as constitutes one of the Cresson bonanzas is like looking for a needle in a haystack, but he will recognize the fact that such drilling, to be a useful guide for working underground, need not find the orebody itself, only the fringes or signs of it. If the Cripple Creek massif—the mass of the ancient volcano—were made of glass we should be astonished to see how much rich ore had been missed despite the numerous holes made by man. Our system of exploration even when most systematic is fortuitous. It remains to record the fact that in 1916 the Cresson mine produced 74,435 tons, averaging \$32.26 per ton and yielding \$2,401,434 in gold and silver. The net income

of the company operating the mine was \$1,634,171 or 68.05% of the gross output.

## 'Near-Ore'—A New Term

In the many discussions arising out of the attempt to define 'ore,' it has been apparent that the unwillingness to abstain from applying the term to unprofitable vein-filling or lode-matter was due in part to a dislike of the word 'waste.' Every mine contains rock that is not an asset and yet is not negligible when an engineer is appraising the mine. The Mexican has three terms, *metal* (or *mena*), *mineral*, and *tepetate*; the first of these means ore, that is, rock that can be exploited to economic advantage; the third is plain waste or country-rock; the second lies between, it may be raised to a level of economic value if a better metallurgic method is introduced, or a new system of mining applied, or a larger scale of operations adopted; it may be lowered to the level of economic worthlessness by adverse conditions, such as an increase in the cost of labor, higher smelter-rates, or a lower extraction in the mill. For this intermediate product we need some new technical term. We venture to suggest 'near-ore.' It may seem humorous, but it is better to smile when using it at first than to apply 'ore' to stuff that yields no profit and be compelled at last to grin on the wrong side of your face. There is 'near-beer,' some of which is prohibition tippie and some so near to the real thing that arrests have been known to follow the sale of it. 'Near-ore' is good plain English and tells its meaning unblushingly. 'He laughs best who laughs last' is a proverb that like most proverbs is equally true if reversed. 'He laughs best who laughs first' applies to the engineer who smiles at this new term and then makes a seriously truthful distinction between what contributes to the profit of a mine and what does not. The shareholders of a mine in the Transvaal are told, for example, that among the resources of their property is 2,000,000 tons of 4-dwt. banket labeled 'unpayable ore.' Of course, 2,000,000 tons of anything is impressive, but, as a matter of cold fact, that reserve of 2,000,000 tons is worth less than 30 cents, because the cost of winning the 4 dwt. of gold is at least \$5 per ton. In course of time—with an advance in metallurgy, or by selecting a more intelligent board of directors, for example—this banket may leave a margin of profit over the expense of exploitation. So the stockholders of a mine in California are told that it contains a large tonnage of 'low-grade' ore, meaning quartz containing so little gold as to yield no profit now, nor for several years perhaps—possibly not until the Greek Kalends. Why not call it 'near-ore'? Then the shareholder, and anybody else interested in knowing the facts, will understand that it is a potential asset. At present he thinks of his millions of tons of 'unpayable ore' as something that gives value to his shares, and in the end the laugh is against him—and a sardonic laugh it is, nothing like the kindly smile that first greeted 'near-ore.'

# DISCUSSION

*Our readers are invited to use this department for the discussion of technical and other matters pertaining to mining and metallurgy. The Editor welcomes expressions of views contrary to his own, believing that careful criticism is more valuable than casual compliment.*

## Colorado School of Mines

The Editor:

Sir—I have read your editorial on the Colorado School of Mines, in the issue of June 16, commenting on the recent trouble there, and as an alumnus of that institution, I wish to express my appreciation of your frank but true criticism.

There never has been, to my knowledge, the strict enforcement of discipline at the School that makes for the highest success and the best training for the students on the threshold of a professional career. During my days at the School, in the early 'nineties, enforcement of discipline was sporadic; we were allowed to do as we pleased for a period until there was some sort of outbreak, often innocent enough in itself, and then the wrath of the faculty would be visited upon us; there would follow strikes, lock-outs, etc., the board of trustees would take a hand, the papers would be full of it, encouraging by undue publicity the rebellious spirit of the student body; but finally every one would get together, a truce would be patched up, and things would run along loosely until another occasion arose, usually a year or two later. I imagine from what I have heard and read that much of the same thing has continued through the various administrations since. No doubt much of the trouble is due to the system under which the School is conducted, involving as it does, governance by a politically appointed board, making for good administration if the board happens to be composed of capable men, and if not, the reverse. The board has always been weak in the two particulars you point out, several members being local men with no qualifications for the job, besides being beholden to the residents of the town, whereas other members that do happen to be capable are too occupied to give the work sufficient attention. As you point out, the appointment of capable alumni is the best hope, and in my opinion the majority of the members should be chosen from among the alumni.

The next requisite is a president and faculty not afraid to outline a rigorous system and to enforce it without fear or favor. In the present crisis the president, at least, shows commendable firmness, and it is to be hoped, for the good of the School, that he may continue to do so, but the facts as recited indicate that discipline was very lax indeed, for most of the students were drunk and disorderly and mishandled a member of the faculty. I am glad to say that this sort of thing did not occur in my days at the School. We had more respect for the members of the faculty and drunkenness was uncommon,

though not unknown. Now, I am satisfied that most of the trouble that has occurred at various times at the School is due to the feeling among the students that they may *en masse* do almost anything and get away with it, for they feel that the faculty and the board of trustees back of them are so anxious to have a good attendance and make a good showing that they will not dare to take any action that would cut down the attendance materially. Therefore the students rely on simply standing together and forcing the faculty and trustees to yield, in other words, to use the weapon that many of them have had used against them in later life by the Western Federation and others, such as, a strike, with its attendant picketing, intimidation, etc. Now, this is not right, and the only way to correct it is to insist on the right of the president and faculty to make the rules, and to abide by them when made, whether it results in the class-rooms being full or empty. The time for the trustees and faculty to settle any differences of opinion regarding the advisability of regulations is before they are announced. If the board of trustees does not approve of what the faculty wants, then it is up to them to get a faculty that is in accord with them, and if the faculty is dissatisfied with the stand of the board, it is up to them, individually and collectively, to resign. But having once agreed on a programme for the governance of the School, it should be distinctly understood that the rules must be obeyed, and that any action by the faculty in carrying this out will have the unqualified support of the board. I admit that it is difficult to carry this out with a State-supported and politically run institution; but until it can be done, there will always be dissensions.

I hope with you and, I believe, with the most of the alumni, that president Parmelee will stand firm in the present crisis, and will not allow any student to return to the School without proper apology, and with the distinct understanding that he and the faculty, not the student body, are running the School. Otherwise it were better for the School to close up until such time as it can be properly conducted, with a student body having a decent respect for authority, and it were better for the students to go into the Army and receive much needed training in obedience, for until they learn this, they will never be of much use in the great industrial army that digs and delves in the hills and smelts in the valleys.

Of course, no one can question the right of the student to leave an institution at any time that he thinks he is not getting a square deal, though in doing so without just cause, he is doing an injury to a community that has furnished him, up to that point, with the start of an

engineering education at considerable expense to itself, but I should think that no other school would be keen on receiving an insurrecto from Golden. I am quite sure that in the largest school of all—that of experience—we who are pretty well through the course would hesitate to take on a man whom we know had helped to disrupt affairs at his alma mater, especially at a time when the needs of the country are calling for more technically trained men. My advice, therefore, to the men who have left the School, is to ask for re-instatement, express regret for the action taken, cut out the booze, and work for the great cause, as well as for the alma mater and their own future professional careers.

C. M. EYE.

Bagui, Philippine Islands, July 21.

## Block-Stopping and Timbering in Deep Placer-Mining

The Editor:

Sir—The article appearing in your issue of August 11, by Harold T. Power, describing timbering in deep-placer mining, was read by me with keen interest, because in 1904 when in charge of the Wild Goose Mining & Trading Co.'s operations at Nome, Alaska, we were confronted with the same problem, but solved it a little differently.

The pay-streak, known as the Mattie channel, was discovered on the south slope of King mountain, on the Anvil-Dexter divide. The first discovery was made in 1900 on the Anvil side of the divide, at 400 ft. elevation above Anvil creek, where it was worked by open-pit methods, rockers being used to recover the gold. Water for the rockers was hauled from Anvil creek and the ground was so rich that as high as \$1200 was realized from a rocker in one day. As the channel crossed the divide at right angles and the surface rose rapidly from the point at which it was discovered, where Anvil creek had cut it out, only a small area could be worked by open-pit methods; deep mining was unavoidable. Water was delivered afterward to this pay-channel by the Wild Goose pumping-plant on Snake river; 300 miners inches of water being pumped through pipe and flume, a distance of 10 miles to an elevation of 750 feet.

As the ground was all thawed, from the surface down, timber had to be continually used in the workings. The price of timber at that time was \$60 per M plus the local freight from Nome to the mine. This made the item of timber a costly one, and the supply was hard to get.

The bedrock was a micaceous schist, varied by slate and lime. About 1½ to 2 ft. of bedrock and 2 ft. of gravel immediately above the bedrock, was run through the sluice-boxes.

The method of working was as follows: The channel, which ran nearly straight, making it easy to follow, was divided into sections 600 ft. long and a shaft was sunk mid-way between the end-lines of each section, care

being taken to sink the shafts on the lower side of the channel and not nearer than 25 ft. from the lower rim, so that caving would not affect the alignment of the shafts when the channel was worked out and always permitted our shaft-houses, bunkers, and strings of sluice-boxes to be on solid ground. The shafts were 6 by 8 ft.; they had a single compartment, with a man-way for ladders and pipes. They were from 69 to 140 ft. deep; 140 ft. being the depth to bedrock on the crest of the divide.

A drift was run from the bottom of each shaft at right angles to, and toward, the middle of the channel. From the shaft this drift was wide enough for a double track, for a distance (usually about 40 ft.) sufficient to give a side-track for holding empty cars. When the middle of the channel was reached the drift was split and continued lengthwise with the channel a distance of 300 ft. each way, thus covering the section of 600 ft. into which the channel had been divided.

At each end of the main gangway the drift was T'ed by a cross-cut to each rim. The channel was from 80 to 110 ft. wide. At first we tried breasting as described by Mr. Power, using 10 by 10 in. and 12 by 12 in. posts, placing them on 3 ft. centres, but we soon abandoned this method as we could not recover any timber when once placed and it proved dangerous. One breast or stope, after it had been opened clear across the channel, caved in a rush to the surface, and we not only lost the breast and all the timber but nearly lost the men who were working in the face.

We then devised the method of block-stopping. This proved successful, permitting us to save all our timber, using it over and over again, only now and then losing a stick. To show to what extent we succeeded, we worked out the entire channel in one 600-ft. section, losing only 5000 ft. B.M.; for we waited until fall, when the frost set the gravel walls of the shaft. We even pulled the shaft-timbers. This method may have been used elsewhere before, but it was original with us at the time and was adopted afterward throughout the Nome district in all the deep mining in thawed ground. Frozen ground did not present any difficulties, as no timber was required.

Our greatest difficulty was caused from swelling bedrock in the main gangways. To overcome this trouble we used the methods described by Mr. Power.

In block-stopping we commenced at both ends of each T and took out a block of ground (each marked No. 1 on the diagram), never more than 10 ft. square, using 8 by 8 in. posts, set on 3 ft. centres, with 3 by 12 in. caps 1½ ft. long, never permitting the caps to cross two posts. When the gravel was so loose that it ran, we filled the spaces with false lagging. When this 10-ft. square block was out and the bedrock cleaned up, we pulled every post (using double or triple block and tackle) except the row against the two solid walls of unworked ground on two sides of the block. Behind this row we lagged solid with 2 by 6 in. lagging, against the unworked walls. Usually the roof caved as fast as we

pulled the posts and the block was immediately filled. Then we took out all blocks marked No. 2 and worked back toward block No. 1 (which we had just left) until we struck the wall of lagging, cleaned up the bedrock, and pulled as before, repeating until the main gangway was reached.

In the meantime new cross-cuts had been cut from the main gangway to the rims, leaving a pillar 20 ft. wide of unworked ground to make a new T. The blocks were worked out as before. We kept these cross-cuts just

than 10 ft. of the vein-width in one sample. On this basis in the simplest of cases, suppose a vein 20 ft. wide, opened by an adit with an incline on the vein 250 ft. deep, accessible on one side, enabling samples to be taken seven feet wide, and three drifts, one at 50 ft., one at 125 ft. down, and one at the bottom of the shaft, each 200 ft. long, and each with three cross-cuts, one at the shaft, another 100 ft. from it, and the last at the face, enabling 6-ft. samples to be taken across the vein in the drifts and two samples of 10 ft. each in the cross-cuts.

DIAGRAM OF MINE-WORKINGS, SHOWING SYSTEM OF EXTRACTION

ahead of the stopers. This method permitted us to work in four places in the mine, besides the cross-cuts, and was sufficient to keep the hoist on a single-compartment shaft busy.

We gradually worked back toward the shaft outward, and, as before stated, recovered practically all our timber and never lost a man, the secret being that we always worked under solid ground, and moved ground so quickly that it had no chance to get heavy and take weight.

E. E. FLEMING.

Chichagoff, Alaska, August 7.

## Sampling of Large Low-Grade Orebodies

The Editor:

Sir—I think that most engineers have mutual confidence in each other's estimates of tonnage and value when succinctly stated, and particularly if after reading the report they approve of the way in which the mine was opened to allow sufficient exposures for sampling.

The development necessary for estimation of ore can perhaps be judged by the tonnage that may be allowed to each sample. Even in the larger mines it is hardly justifiable to take samples more than 10 ft. apart or more

It is unnecessary to say how the samples should be taken, or how many cuts to each one. According to the weight of ore, this gives roughly for each sample 750 tons for quartz and 1100 tons for heavy sulphides, so that on a 20-ft. vein with fair development any estimates based on 1100 tons per sample for quartz and 1600 for heavy sulphides should be satisfactory. With a 5-ft. vein the samples should not be over six feet apart, and only 200 tons for light and 300 for heavy ores could be allowed, while on a 60-ft. vein opened 750 ft. deep it could easily run up to 2500 and 5000 tons for light and dense ores respectively. If it were necessary to gauge the value of such a property by a mill-test, I would slab off the end of the shaft, and the roofs of the drifts and cross-cuts, sending the material in an unmixed stream through properly arranged bins to, say, five stamps, with coarse screens with only the width of the screen-frame for discharge, discarding amalgamation in the battery; and I would take screen-samples for assay every half-hour, by-passing the pulp with a pump, if necessary, to an adjoining battery for the metallurgical test. The Butte & Superior was a mine opened in the manner described above, only much more so, and to the 1600-ft. level. Just after it was acquired by Hayden, Stone & Co. I was allowed to study it underground with the thorough

assay-maps on hand, for a prospective investor. My conclusions on tonnage and assay-value agreed with the reported estimates, which seem to have been well realized.

Mill-runs and the past product of mines, as we all know, can only be applied intelligently after thorough study of the property. In 1901 I spent three days on a large irregular deposit that had paid \$3,000,000 net and estimated there was \$4,000,000 more net left above the bottom level, but as the price was \$7,000,000 and the missing \$3,000,000 plus the profit had to come out of new ground, I thought it not advisable to proceed with an expensive examination. No statement had been made by the owners as to reserves, and they accepted my conclusions without chagrin. It is a good mine yet, and results have been slightly more in favor of the owners than was predicted.

On the other hand, a few years ago I was asked to report on the ore-reserves and future development of a gold mine, on the wisdom with which \$250,000 had been spent on the new surface plant, and on the best way to spend \$250,000 more to hurry it to completion. After reading a report by the engineer employed to advise concerning the original investment, I said that even though the conclusions stated happened to be true they were entirely unwarranted by the evidence set forth. From the previous output of the mine—80,000 tons yielding \$600,000—which had about ended at the time of his visit, and some erratic samples, he placed the ore-reserves at 1,000,000 tons of \$7 ore, with probabilities of several times that amount. He preferred the mill-results to sampling, it being one of those mines that could not be sampled, the metal-content being too uneven. After a flying visit to the property, a competent sampler was chosen by the investors at my request. He found that everything of value had been stoped and that all the remainder, including levels under the old stopes, averaged \$1.25. I was asked to re-sample, but I told them that the 1000 samples taken were uniform—only a few going over \$4, the highest \$7—the descriptions of the samples were clear, and I felt sure the \$1.25 was correct.

With tedious care correct samples can sometimes be taken with a small pick. Nearly 25 years ago I sampled the Chainman deposit at Ely; this was a large body of hard quartz and iron, including magnetite, several hundred feet long, 20 ft. wide. For the 200 to 300 ft. it was developed, oxidation had disintegrated the vein into rounded boulders, from the size of a marble to six feet in diameter. They hung together without timbering, but cutting through them made large samples. Years after, in Alaska, Charlie Lane said, "What did your Chainman samples go?" "\$4.50," I said. "You were right, ours went \$6," he replied.

Chalcopyrite can be spotted. Preparing to sample the Mamie mine, on Prince of Wales Island, Alaska, the superintendent pointed to the irregular bunches of yellow chalcopyrite in the black magnetite and the impossibility of correct sampling. Two-foot holes were put every five feet along the sides of the levels, and blasted on canvas. Along the croppings 3-ft. holes were drilled,

loading them just enough to crack the material so it could be barred. Then miners broke the pieces with sledge-hammers, on platforms, and I coned and quartered it, till the samples were small enough to be carried away. After the ore was stoped it was pleasant to see in the U. S. Geological Survey's report that it had averaged about 2%, and was within 0.1% of my sampling.

Regarding the 'high' sample, unless its inclusion is well warranted I take care of it individually. I think that on the whole estimates of ore-reserves are slightly optimistic, probably because every effort has been made, and wisely, to uncover the best places. Mines are not bought solely on their reserves; the future possibilities must be considered. A mine should be young and strong enough to compensate for any disappointments occurring in blocks of ground already opened. In the War Eagle and Centre Star mines at Rossland, in the first few years, the samples averaged 30% of quite high assays; the remainder were low, say, under \$10 gold or the cost of mining and treatment. I gave a table indicating this fact in the third annual report, and the local papers were quite shocked. These samples were taken after each round of blasting. It was all machine-drilling, before the face of a drift or a slope had been picked down, a necessity in such intensely hard rock. In the assay-office each sample was divided by weight into its component parts, so that in a composite sample it could have read one-eighth quartz, one-eighth spar, one-eighth chalcopyrite, one-eighth arsenopyrite, one-eighth pyrrhotite, one-eighth country-rock (included in vein), one-eighth silicified foot-wall, one-eighth dike. Each was assayed separately in order to study the metallurgical problem and for general knowledge. When beginning operations I took the samples and made the division myself in presence of the samplers, afterward the older men taught the newcomers. Soon A. A. Cole, now president of the Canadian Institute of Mining Engineers, had charge of the laboratory, and consequently of the divisioning. In spite of the great difference in value of the samples, as they were really only from faces three feet apart, as soon as the ore was mixed by stoping, it was uniform in the 100-ton lots sampled, about \$20 gold plus copper and silver. Sometimes I would feel quite desperate at the uneven assays, fearing what the average outcome would be, but each month the smelter-returns and mine-sampling agreed.

The mention of mill-tests always makes me wonder how precautions are taken against salting and recalls stories of moth-eaten \$5 gold-pieces that have been found in mortars.

JOHN B. HASTINGS.

Los Angeles, August 31.

THE U. S. GEOLOGICAL SURVEY estimates that nominally six pounds of magnesite was formerly used for every ton of steel made by the basic open-hearth process, but not more than half a pound per ton is now being used, and at some steel plants cheaper and less satisfactory refractories have been substituted for magnesite.

# The Cresson Bonanzas, at Cripple Creek

By HORACE B. PATTON

INTRODUCTION. Nothing seems to appeal so quickly to the popular imagination as the finding of rich gold ore. This, of course, is due to the limitless possibilities of sudden wealth. From the time when Stratton first made his memorable strike in the Cripple Creek district and the Independence mine was made to pay for itself 'from the grass-roots' this district has been conspicuously in the public eye. Since the first discovery many

The last one has attracted less attention than most of the others, yet it bids fair to equal, or even surpass, the first. The importance of it lies in the fact that a vein has been opened up not only of great richness but of a character entirely different from that discovered in 1914. It is this latest discovery and what it may develop that justifies at this time the publication of this article.

THE DISTRICT. Cripple Creek lies in Teller county,

THE CRESSON MINE, CRIPPLE CREEK

other 'strikes' have been heralded in the public press. Most of these have come to nothing, but the successes have been sufficiently frequent to keep the public expectant. As the years have gone by, however, and mining has been carried to greater depth, startling discoveries have been rare.

Such was the opinion in December 1914, when the Denver papers announced the discovery of a veritable 'bonanza' in the Cresson mine. What gave this announcement more than ordinary significance was not alone the fact that it proved to be well-founded but that the strike was made at a depth of over 1200 ft. below the surface. This gave an impetus to deep exploration.

During the three years since this rich deposit was struck there have been many announcements of additional rich 'strikes' in the Cresson mine, most of which have been born of newspaper imagination. Still it remains true that there have been two important discoveries since the first find. One was made in the summer of 1916 and the other about the middle of July this year.

Colorado, west of Pike's Peak and 25 miles from Colorado Springs as the crow flies, but 50 miles by rail. It lies at an elevation that ranges from 9400 to 10,800 ft. above sea-level. The area within which important mines are situated is quite limited, being roughly elliptical in outline and measuring about three by five miles.

Geologically the Cripple Creek mining district is a fine example of a deeply eroded volcanic dome. The floor through which the igneous masses broke consisted of pre-Cambrian granite, which had itself been injected into gneisses and schists and which caught up and enclosed fragments of these schistose rocks. Some of the included fragments measure a mile or more in their greatest dimension. Volcanic activity began with a series of tremendous explosions that rent the rock and developed a crater of about the dimensions of the present active mining centre, that is, 15 square miles. This crater was filled in part by falling fragments of the pre-Cambrian rocks but mainly by the shattered igneous material ejected by successive volcanic outbursts.

Periods of violent explosive activity seem to have alternated with periods of quiescence during which massive lava was forced into and through the volcanic ejectamenta that filled the central crater and that at times poured over the surface in the form of lava streams. In this way the brecciated area became injected with numerous and irregular dikes and small bosses. A continuation of this process built up an extensive volcanic cone, which grew to an unknown but considerable height above the present surface. Erosion has removed a large portion of the volcanic pile that rises above the general level of the pre-Cambrian floor and has given the surface its present mountainous character.

The igneous rocks of the district were originally described as definite types of andesite, phonolite, rhyolite, and basalt, but later researches by officers of the U. S. Geological Survey have shown that most of these rocks are to be considered as intermediate types between phonolite and andesite, of which latite-phonolite predominates.

**THE ORES.** Gold is the principal metal mined in the Cripple Creek district, and it occurs almost exclusively combined as a telluride. Where oxidation has removed the tellurium it has left the gold in a spongy condition, known locally as 'rusty gold'. The gold tellurides have been described under the names sylvanite and calaverite, the former being the name in common use. These two tellurides both contain gold and silver, but in different proportions. Sylvanite is supposed to have the composition  $(\text{Au}, \text{Ag})\text{Te}_2$ , in which the two precious metals are present in equal parts. This gives the following percentages: Te 62.1, Ag 13.4, Au 24.5, or a proportion of gold almost twice that of the silver. As a matter of fact, however, the Cripple Creek ores give a much higher percentage of gold and a correspondingly lower percentage of silver than that required by the formula for sylvanite. Analyses of pure telluride show approximately 40 to 41% gold and less than 3% silver. Therefore calaverite, the telluride of gold, predominates.

Pyrite is abundant, and other sulphides are associated with the tellurides. The customary gangue-minerals are quartz, chalcedony, dolomite, and fluorite.

**THE VEINS.** Lindgren and Ransome in their treatise\* on this district state that the ore deposits are of two types, (1) lodes or veins, (2) irregular replacements; but that the two cannot be kept sharply distinct, as replacement may modify the development of distinct veins, and minute veins may traverse replacement bodies. Ore-shoots are likely to be associated with fissures. This is especially true of the smaller veins, which are likely to show richer mineralization at the junction of two veins. Fissuring is not so characteristic of the larger ore-shoots.

The telluride deposits are supposed to have been formed by heated waters making their way to the surface from a considerable depth. In this connection

Lindgren and Ransome say: "The view that most of the water and most of the substances contained in the veins were given off by intrusive bodies slowly cooling at considerable depth and were forced up through the upper part of the volcanic mountain as soon as the formation of the fissures allowed them to rise is considered more plausible. The waters ascended in the deeper part of the volcano with comparatively greater velocity on the fewer fissures here available. Nearing the surface they spread through a larger space in a more complicated fissure-system. The speed became checked and the conditions for precipitation improved. Deposition and the chemical action of the country-rock changed the composition of the solutions, and a mingling with fresh ascending waters, possibly also with atmospheric waters, induced further precipitation. In this matter are explained the smaller amount of ore deposited in depth and the richness and abundance of ore nearer to the old surface. The proportion of the volcano removed by erosion may have contained still richer deposits."

**THE CRESSON MINE** is situated at an elevation of approximately 10,000 ft. in Arequa gulch at a point about half a mile north-east of the small town of Elkton. It is owned by a company incorporated in 1895. The mine was worked by the company or by lessees without any noteworthy results until 1905. Since that date it has been under the direction of Richard Roelofs, to whose efficient management is largely due the profitable development of later years.

In co-operation with H. J. Wolf,† I have published a fuller account of the great Cresson strike of 1914 than can find room in the present article. The following quotation will suffice to give an idea of the geology of the mine.

"The Cresson shaft is close to the contact of the breccia of the central part of the district and an intruded mass of latite-phonolite. The rock of the mine is breccia, with the exception of one or two dikes. According to the statement of Mr. Roelofs there occurs within the breccia, which ordinarily is a firmly cemented rock, a local area of irregularly elliptical horizontal section in which the breccia has been greatly shattered so as to produce numerous cracks and minute cavities throughout the mass. This area of shattering extends in a north-easterly direction for a length of about 1000 ft. and a breadth of 500 ft. It extends down to and below the 12th level. This condition of this fractured mass is such as to suggest some local explosion that produced an unusual shattering of the rocks. Inasmuch as the breccia of the Cripple Creek district is normally highly indurated and as the spaces that must at first have existed between the fragments have been filled by the cementing materials, it does not permit a ready circulation of mineralizing waters except where the breccia has been subsequently shattered, as in the case of this elliptical zone

\*'Geology and Gold Deposits of the Cripple Creek District, Colorado', by Waldemar Lindgren and F. L. Ransome, U. S. G. S., Prof. Paper No. 54.

†H. B. Patton and H. J. Wolf, 'Preliminary Report on the Cresson Gold Strike at Cripple Creek, Colorado'. Colorado School of Mines Quarterly. Vol. IX, No. 4, 1915.

of fracturing in the Cresson mine. Undoubtedly this condition is responsible for the occurrence of the ore-shoots.

"The comparatively loose or porous structure of the shattered rock seems to have furnished a ready line of circulation. In fact, two such lines of circulation developed, one along the south-east and the other along the north-west side of the fracture-zone, leading to the formation of two extensive ore-shoots. The accompanying sketch, Fig. 1, shows the position of these two ore-shoots, as disclosed on the 12th level. The larger ore-shoot forms a roughly elliptical body 500 ft. long on the south-east side, with a greatest width of 150 ft. This shoot becomes narrower above the 12th level and has been followed as far as the 3rd level. Its dip is that of the wall of the fractured area of which it forms an integral part.

"On the other sides of the fractured area is the other shoot also elliptical in outline. This likewise runs up to about the 3rd level. It measures 250 ft. by 35 ft. in greatest dimensions.

"These two ore-shoots contain telluride of gold fairly well distributed throughout the mass. The gold content, as will appear later, is not uniform, but it does not follow visible veins. Usually the telluride is invisible. In places it may line the sides of some of the numerous small fractures. It is probably more likely to occur on the face of the fractures, even though it may not be present in sufficient quantity to be visible, but according to Mr. Roelofs it is to be found also inside the breccia fragments. The ore occurrence in the Cresson differs somewhat from that in other properties of equal importance in that the ore-shoots were of relatively trivial importance for the first 350 ft. from the surface. The ore improved in quantity and quality below this level and from the 6th to the 12th level the two main ore-shoots have been continuous. The ore has improved in quality with depth, and near the 12th level there has been a decided increase in the width of the larger ore-body."

**THE FIRST BONANZA.** In the latter part of November 1914 a raise from one of the cross-cuts driven in the larger of the two ore-shoots on the 12th level suddenly broke into a large cavity or chamber at a point five or six feet above the floor of the level. The chamber was opened near the lowest part. The floor and lower part of the walls consisted of a soft, porous, almost chalk-like, whitish material. Apparently the entire chamber was at one time lined one or two feet thick with this material, which was so soft that it could readily be shoveled. From the upper part of the chamber it had become loosened and had fallen, accumulating to a thickness of several feet on the floor. All of this white lining assayed high in gold, and some of it astonishingly high. As sacked and shipped it yielded from \$10,000 to \$16,000 per ton.

Behind the porous lining the walls of the chamber consisted of the ordinary breccia of the large ore-shoot. The fragments composing the breccia had been exten-

sively altered by thermal waters, and solution-cavities had been formed between them. Crystals of calaverite thickly studded the surfaces of these solution-cavities and penetrated the substance of the rock-fragments. Close to the wall of the large chamber the impregnated breccia showed varying but extremely high gold contents approaching those of the chamber-lining. On working outward from the chamber it was found that the rock became less impregnated with calaverite until at, say, five or six feet, the assay-value was not greatly above the average of the main ore-shoot.

The chamber as first opened may be said to have had the shape of a pear, the narrow portion being above. Its dimensions were approximately 23 ft. long, 13½ ft. wide,

FIG. 1

and 40 ft. high. When the richer portions of the breccia had been worked out the greatly enlarged chamber had a much more irregular shape, and extended downward 10 or 12 ft. below the floor of the 12th level.

The soft lining, when closely examined under a magnifying glass, was seen to consist in part of minutely crystalline matter and in part of an earthy substance. The crystalline material was celestite, the sulphate of strontium. The earthy portion, on account of admixture with the celestite, was not definitely determined. It looked like kaolinite. The gold content of this lining consists of calaverite, which occurs in small crystals thickly scattered throughout the white gangue. The great richness of this material would hardly be surmised from its appearance. The actual amount of gold obtained from this interesting deposit cannot be given accurately because much of the high-grade ore was mixed with low-grade ore before shipping, and for the further reason that the gold content decreased gradually from the walls of the chamber outward, so that no sharp line could be drawn between the chamber-deposit and the ore of the larger shoot in which this deposit was formed. It may be stated safely, however, that at least

\$1,200,000 net was taken from the lining and walls of this cavity.

Chemical analyses of the gold telluride occurring in the chamber-walls correspond with the mineral calaverite, the proportion between the gold and the silver ranging from 8 to 18 for gold to 1 for silver. The gangue-minerals with the calaverite in the wall-rock were chalcedony, quartz, dolomite, and celestite. Recognizable quartz was rather rare, as the silica occurred almost entirely in the form of a spongy chalcedony. Fluorite, so common in association with quartz in the veins of Cripple Creek, was missing.

As to the origin of this rich pocket of ore, it may be presumed that the cavity represents an enlarged portion of a passage along which heated mineralized waters were working their way to the surface from deep-lying igneous masses. That the conditions under which the ore was deposited in this case were unusual may be inferred from the fact that large cavities are not common in the Cripple Creek district, and, when found, are almost invariably barren. Such a barren chamber has, in fact, been encountered in this same mine.

**ORE AT LOWER LEVELS.** It was naturally to be expected that a rich chamber of the character just described must have been fed by mineralizing waters coming from a considerable depth; therefore a connecting vein ought to be found beneath the chamber proper. The ore was traced from the chamber downward for a distance of a little less than 30 ft. below the 12th level, but efforts to trace it were unavailing. Furthermore, the two main ore-shoots that had been followed downward also suddenly ceased a few feet beneath the 12th level, with the exception of a comparatively small finger-like extension that has been proved to extend as far as the 14th level and deeper. A large amount of exploration was done on the 13th level in a vain effort to find a continuation of the rich ore-chamber or of the two regular ore-shoots. Mr. Roelofs has stated that for a year and a half the outlook was extremely discouraging. Failing to find any considerable orebody on the 13th level, development was continued on the 14th for a long time without better results. Eventually persistent search was rewarded.

**THE SECOND BONANZA.** Failing to find ore on the trend of the regular ore-shoots the manager prospected east of where the main shoot should have been found. This was done largely by means of diamond-drill holes bored, some at an angle of 45°, others on the horizontal, and by driving cross-cuts. In this way, in the summer of 1916, an orebody was struck 85 ft. east of the natural course of the main ore-shoot and in a part of the brecciated area that elsewhere had not been found to carry workable ore.

This new orebody measured 150 by 50 ft. The longer axis was roughly parallel with that of the main ore-shoot. I am unable to state to what extent, if any, this ore differed from that of the main ore-shoot, but I understand that, with the exception of the core, it was similar to that of the two ore-shoots outside the above-

described chamber. This core was in the shape of a narrow strip 30 ft. long, with its major axis nearly parallel with that of the larger body in which it lay, and it appeared to be a specially enriched part of that larger body. No information is at hand as to the output from the larger body nor as to the richness of the high-grade core except that \$250,000 was taken from it.

**THE THIRD BONANZA.** Further development has extended the workings to the 16th level. On this level until recently no ore had been struck. On the 15th level some ore had been obtained from the finger-like extension of the main shoot and from a downward extension of the orebody just described. The third find of high-grade ore is the most promising of them all.

Early in July of this year, in driving a cross-cut on the 14th level in ground east of the main drift along the line of the larger ore-shoot, a vein of quartz was struck; this, on being followed, showed ore and, farther on, rich ore. In this vein the gold occurs as sylvanite in comparatively large crystals. The gangue consists of quartz, massive and in crystals, together with purplish fluorite and much pyrite. It contains none of the celestite or dolomite or chalcedonic silica that characterizes the gangue in the great chamber on the 12th level. The vein has a tendency to split into several irregular and parallel smaller veins or stringers that afford a strong contrast with the ordinary breccia of the wall-rock; it has been followed in continuous high-grade ore for 102 ft., ending in a breast of low-grade ore. At the time of my visit practically no stoping had been done, but a drift had been driven on a vein averaging 4½ ft. wide. The total material broken in this drift, consisting of country-rock with included veins and stringers, averaged \$500 per ton. In places the vein is astonishingly rich. At the time of my inspection stoping had just begun and the vein exposed in the stope was of the kind that every miner fondly hopes some time to drive his pick into. In spots, several inches wide, the vein had the appearance of almost pure calaverite. At one particular point it would have been possible to cut out a rectangular block measuring four and a half inches thick and a foot square that would contain 50% calaverite, the rest of the vein being white quartz.

The significance of this strike lies not merely in the extraordinary richness of the ore, but in the fact that this is the first distinct and strong vein struck in this mine, and that its character is entirely different from that of the first strike of high-grade ore in the big chamber; it is also entirely different from the ore of the two main stopes that have furnished most of the ore taken from the Cresson; lastly, it was struck on the 14th level and there is every reason to expect that the vein extends downward as well as upward to a considerable, if an unknown, distance. As it was found in a part of the ground in which ore has not heretofore been suspected, the discovery encourages deeper prospecting; all the more so as this vein appears to have been fed from an entirely different source from that of the other ore-bodies.

It is too early to venture an estimate of the money to be taken from this newly discovered vein, but \$500,000 would be a conservative guess.

Figures as to the average production from the Cresson mine for any one period, of, say, a month or a year, are misleading on account of the irregular production of high-grade ore; still it may be of interest to know that the mine has produced during the last 12 months an average of 8000 tons net per month with an average assay-value of \$30 per ton. Since the discovery of the great chamber the mine has produced \$3,400,000 in smelter returns.

## Financial Assistance to Families of Soldiers and Sailors

The faulty working of the pension system has emphasized the necessity for carefully considering the methods of furnishing financial assistance to the families of soldiers and sailors. Obviously the task is so great that the Government alone can assume it. A bill representing the careful study of the whole problem of possible dependency as a result of the War has been simultaneously introduced in both houses of Congress.

The bill is an amendment to the act establishing the Bureau of War Risk Insurance. It adds to the duties of this Bureau the administration of family allowances, allotment to dependents, compensation for death or disability, and life insurance for men in the military or naval service. Secretary McAdoo states that the cost for the first year for the complete activities of the Bureau will be \$176,150,000 and for the second year \$380,500,000. The main purpose of the bill is to grant reasonable government indemnity against the losses and risks incurred in the discharge of a patriotic duty and in the performance of an extraordinarily hazardous service to which the Government has called and forced the citizen. It aims to accomplish these ends by granting a reasonable measure of indemnity against risk of loss (1) of support of the bread-winner, (2) of life and limb, (3) of present insurability at ordinary rates. The risk of dependency, in the case of an enlisted man's family, is indemnified by allotment of part of the pay of the enlisted man, supplemented by a family allowance granted and paid by the Government.

Secretary McAdoo illustrates the working of the system in the following example: "A private gets \$33 per month for service abroad. If he has a wife and two children he must allot to them at least \$15 out of his pay. The Government supplements this by giving the family an allowance of \$32.50. This family's minimum monthly income, therefore, would be \$47.50. The father can allot as much more as he pleases. If there is another child, the Government will allow \$5 additional. If the man should have a father or mother actually dependent upon him, he can secure an allotment of \$10 per month from the Government for the parent by allotting \$5 more of his pay. Thus, the private with a wife, three children,

and a mother actually dependent upon him, by giving \$20 out of his \$33 per month, would get from the Government \$47.50 per month, giving the family an income of \$67.50 and still leaving the man \$13 per month for spending money. If there are more children, or if there is also a dependent father, the Government would grant as much as \$50, over and above the man's own allotment."

Provision is made whereby men that do not allot their half-pay fully may deposit the remainder at 4% compound interest. The risk of disability to officers, men, and nurses is indemnified by compensation analogous to the Workmen's Compensation Act. Total disability is compensated on the basis of a proportion of the pay, from the minimum of from \$40 to \$75 per month up to the maximum for the higher officers of \$200 per month. Compensation for disability is granted in proportion to the completeness of the disability. Medical, surgical, and hospital treatment is included. Provision although not at present detailed, is made for the rehabilitation and re-education of the injured. Risk of non-insurability at ordinary rates is provided for by Government insurance in amounts from \$1000 to \$10,000 for total disability or death. The excess cost due to the increased mortality and disability risk should be borne by the Government. The bill places the responsibility where it obviously belongs—upon the National Government. Local relief obligations will be assumed by the Red Cross. Clearly the purposes of this Act are to prevent families from suffering want while the bread-winners are fighting for their country.

THE possible recovery and utilization of pyrite occurring with bituminous coal is suggested in circular 5 of the Engineering Experiment Station of the University of Illinois by Professor E. A. Holbrook of the department of Mining Engineering. A series of experiments conducted on a commercial scale has shown that, where pyrite occurs in sufficient quantities to justify its recovery, a 50-ton plant may be designed to serve a single mine or group of mines which will yield a profit of about \$75 per day, or \$1.50 per ton of raw pyrite, with an initial capital cost of about \$18,000. It is pointed out that the market for domestic pyrite is active at present and that prices as high as \$8 per ton are offered. The supply of Spanish pyrite, which normally is adequate to meet the demand in the United States, has been cut off while the extent of the uses for the mineral has increased. The circular referred to presents a discussion of the composition of pyrite, a detailed review of present market conditions, a description of the machinery required in a preparation plant, and a statement of the methods of operations to be employed. The circular is illustrated with charts and photography, and also with drawings showing suggested plant arrangements. Attention is called to the fact that the processes outlined have been developed upon a working-scale. Copies of the publication may be had by addressing the Engineering Experiment Station, Urbana, Illinois.

## Purity of Selected Copper Made in Converters

By HENRY F. COLLINS

\*Reference has been made in a former paper (Trans. A. I. M. E., 1915) to the bottom-process in converters as practised in my work in Spain. For this I can claim no priority, since, although evolved independently, the same method had been previously employed by other metallurgists in Australia. Soon after the outbreak of the War in 1914, the Huelva Copper Co. was led to employ this method in order to save part of the gold content and to facilitate the utilization of the product in Spain for making brass for munitions, as well as bronze for coinage and other alloys, without further previous refining. It is noteworthy that practically the whole of the output produced by this method has been saleable upon the basis of 'best selected' or at most with a deduction of £1 or £2 from the full 'best selected' quotation, and as regards freedom from impurities the copper is considered as quite equal to the 'best selected' quality for making alloys. Particular testimony to this fact has been afforded by its utilization for coinage purposes at the Madrid mint. For rolling, the copper is of course unsuitable, on account of gas-pores and because the slight excess of oxygen renders it brittle, so that for this purpose it must be re-melted and 'brought to pitch.' In order that the copper as cast from the converters may be pure enough for brass making, it must be very slightly overblown. The operation is, however, one of some delicacy, and great care must be taken not to overshoot the exact point, since too much oxygen would be injurious to the quality of the resulting brass. The reaction between residual combined sulphur and dissolved oxygen is still proceeding when the operation is finished, but, on account of chilling, the charge cannot be left in the converter long enough to admit of settling down to tranquil fusion. When employing small converters holding charges of from 15 to 30 cwt. of copper, no difficulty was, however, experienced in pouring direct from the converter, without serious chilling, into small ingot-molds holding about 44 lb. apiece instead of the much larger pigs of 140 to 220 lb. into which converter copper is ordinarily cast. The ingots are dumped into water-tanks in the ordinary way for 'best selected' copper, and show the same characteristic rose-red color. Their upper surface is, however, marred by blisters from the expulsion of  $\text{SO}_2$  upon solidifying, and, as already stated, the excess of oxygen, which it is necessary to introduce in order that the impurities may be sufficiently expelled, makes the ingots too brittle for rolling.

In order to show the exceptional freedom from deleterious impurity of the copper produced from highly arsenical zincy and leady ores by the selecting process, two analyses are appended, each of which is the average

sample of a lot of from 20 to 50 tons and represents the average of a large number of charges mixed together. Two analyses are also given of the 'bottom,' in order to illustrate the extent to which the impurities are separated.

At the works of the Huelva Copper Co., additional refining is omitted, but reverberatory refining of converter-selected copper is, however, carried out at a well-known Australian works, when copper is being handled which is too low in gold and silver content to justify electrolytic refining of the whole of the copper. The bulk of the precious metals present (particularly the gold) being first concentrated into 'bottoms' for electrolytic refining, the 'selected' copper produced by the remainder of the converter-charge is 'poled' and brought to pitch in a reverberatory refining-furnace, from which it is cast into ingots of the usual 'best selected' type. These are known as 'fire-refined' copper, and have been recognized recently by the London Metal Exchange under that title as of equal quality to 'best selected.' In order to show its purity, the following analyses are given, each of which represents the average sample of a large lot as shipped.

	Fire-refined copper

# Cyanidation of Flotation Concentrate

By JAMES G. PARMELEE

**INTRODUCTION.** Any analysis of the problem of cyaniding flotation concentrate that will help to bring about an economy in the recovery of silver must interest all metallurgists. The present price of silver is high owing to the demand created by war conditions. An increase in the amount now produced will not materially affect the price, but if the cost of production can be lowered the net returns will be higher. A prime factor is a lower cost of freight to the smelters. The distance of a concentrating-plant from the smelter, then, is the main proposition. If situated a few miles away it is possible to have the flotation-concentrate treated and obtain reasonable returns. On the other hand, concentrators a hundred miles or more distant must meet such a high freight charge that the net profit becomes smaller. Therefore, to overcome this, the flotation concentrate must be cyanided on the property. As a result of the success attained by flotation in the past four years the cyanidation of the concentrate is at present a subject of intense interest to the metallurgical world.

The cyaniding of flotation concentrate is difficult, owing to the fact that two-thirds of the oil added to the ore usually appears in the concentrate. Finely divided metallic gold in the form of flotation concentrate has been cyanided in several cases<sup>1</sup> without much difficulty while the cyaniding of flotation concentrate containing silver as argentite ( $\text{Ag}_2\text{S}$ ) or tetrahedrite ( $4\text{Cu}_2\text{S} \cdot \text{Sb}_2\text{S}_3$  approximately) has been unsuccessful. Certain minerals are difficult to cyanide in any case, and the oil as retained by the sulphides tends to increase the difficulty. Some metallurgists claim that oil has no effect on the cyanidation of flotation concentrate. J. E. Clennell<sup>2</sup> says: "Starting with a 0.204% KCN solution, and using various oils, my lowest percentage of KCN remaining after agitation was 0.108%. This plainly shows less than a 0.3% consumption of KCN, and also that the oil has no deleterious effect." Hugh Rose<sup>3</sup> says: "The raw flotation-concentrate cyanides with no more difficulty than a gravity-concentrate. The cyanide consumption maintains more or less the same ratio as in the crude ore, namely, 4 gm. of NaCN per gramme of silver. In this test an extraction [meaning 'recovery'] of 98% of the gold and silver was obtainable." The ore that Rose used for this test was notably free from base metals and the silver was in the form of argentite ( $\text{Ag}_2\text{S}$ ).

In comparison with this, E. A. Herson says:<sup>4</sup> "Were

it not for the trouble of the oil, the treatment of ore by a combined process of flotation and cyanidation would promise great economy. Cyanide treatment in many cases would be a direct process for recovering the valuable metal of the concentrate without the costs involved in shipment and in smelting. A low extraction is, however, the result."

The hindrance to high extraction is apparently due to the physical action of the oil, which forms a film-sack or coating around each metallic particle. This coating is thin, but nevertheless may prevent the access of the cyanide solution. It is evident that an oil must be chosen, not alone for its flotative action, but also for the influence it may have upon the extraction by cyanide.

As the cyanide solutions must be used cyclically, serious difficulties are apt to occur. This is ably expressed by P. A. Avery,<sup>5</sup> who says: "Especially is this true in the precipitating end of the plant. It seems that a combination of oil, alkali, cyanide solution, and zinc-dust bring about the precipitation of a gelatinous compound that clogs the zinc-press cloths, causing pressure to rise beyond dangerous limits. This case is cited to show what might be expected, if certain flotation-oils are not removed before cyaniding. Not only does oil affect the cyanidation of the flotation concentrate but it also affects the zinc-box precipitation. The same reaction would take place in a zinc-box, for zinc is zinc whether it be thread or dust. A nasty oily precipitate might finally accumulate causing a decrease of the inflow and a drop in the precipitative efficiency of the zinc."

In the present investigation a series of experiments was made to determine first, the effect of the presence of oil in cyanidation, upon an ore otherwise amenable to cyanide treatment; second, the effect of the presence of oil on the cyanidation of the sulphides, that is, the flotation concentrate; and third, the possibilities of removing the oil.

**EFFECT OF OIL.** For investigation of the first point a silicious ore, assaying 20 oz. silver in the form of silver chloride was obtained and reduced to 200-mesh. To the pulp was added water and oil, thoroughly mixing in a Janney testing-machine. Potassium cyanide and calcium oxide were then added to the solution, which was agitated for 16 hours in inverted glass chimneys fitted for air-agitation of the pachuca type. A blank test without oil was run at the same time to obtain a comparative extraction. The oils used in this test and in those that follow were, crude pine-oil, pine-tar creosote, wood-creosote, coal-tar creosote, and special resin-oil. Three separate

<sup>4</sup>Met. & Chem. Eng., Vol. XIV, p. 675.

<sup>5</sup>M. & S. P., Vol. CXII, p. 661.

groups of tests were conducted in which varying percentages of oil were used. The results of the effect of oil upon an ore amenable to cyanidation show that oil has no noticeable effect upon an ore when no sulphides are present.

In the following table constant factors were: weight of pulp, 100 gm.; 500 cc. water; 0.5% KCN; 1% CaO; 16 hours agitation; through 200 mesh:

TABLE I

EFFECT OF OIL IN PRESENCE OF SULPHIDES. To note the effect of oil upon sulphides it was desirable first, to cyanide raw concentrate with and without oil, and then to cyanide the flotation concentrate, after which a comparison could be made. The pulp used was from a lead-zinc tetrahedrite ore containing silver. This tetrahedrite has in the past yielded poor recovery in cyaniding. Therefore low results would naturally be expected. Ordinary table and flotation-concentrate were obtained as usual. Oil was added, in all cases save one, on the table-concentrate, after which the pulps with oil and those without were cyanided for 18 hours in the lamp-chimney cells.

The results of these tests show that the presence of oil makes an average difference of 20% in extraction between raw concentrate with and without oil, and 15% difference between the raw concentrate without oil and the flotation concentrate. It is noticeable that the heavy oils give a lower extraction than the light oils. This would be expected from their adhesive qualities and therefore such oils should be avoided if flotation is to be used prior to cyanidation.

In the following table the constant factors were: weight of pulp 50 gm.; water 250 cc.; KCN 0.5%; CaO 1%; agitation 18 hours; and oil 1%.

REMOVAL OF THE OIL. When oil is present in small quantities in some materials it can be saponified and washed away from the substance in the form of soap. Furthermore, when the amount of oil is appreciable it can be removed by simple oil-solvents. Roasting expels or destroys the oil, but when silver is present the roasting tends to form an insoluble silver compound. A chloridizing roast is not open to this objection. Clennell and Butters<sup>6</sup> refer to experiments in which roasting

TABLE II

was tried. The ore that Clennell was investigating contained gold and silver, but the silver was not considered because of the smallness of the quantity. Clennell says: "As results obtained by direct cyanidation of flotation concentrate did not prove encouraging we turned our attention to roasting the concentrate previous to cyanidation. Three tests were carried out with the percentages noted below:

	Extraction	
	Gold %	Silver %
(1) Oxidized roast, water-wash and cyanided....	97.0	5.0
(2) *Oxidized roast, acid-wash and cyanided....	98.8	11.1
(3) Cyanide flotation roast, acid-wash and re-cyanide .....	64.9	10.9

\*Concentrate.

The most favorable results were found when roasting at a low temperature; under these conditions a maximum amount of copper was extracted by washing with water, and the highest extraction of gold with a minimum consumption of cyanide.

From the last statement it is seen that gold can be recovered easily by cyanidation after the pulp has been roasted at a low temperature. As said before, the silver in an ore can also be recovered by cyanidation after the flotation concentrate has been given a chloridizing roast at a low temperature.

SOLVENTS FOR OIL. The following oil-solvents have been tried. Hot water, alcohol, ether, alkali, soap, benzene, gasoline, carbon bi-sulphide, carbon tetra-chloride, and acetone were used to determine the solvent action on various oils. Into sets of glass beakers small pieces of clean 'steel' galena were placed; oils of different quality were then added to each set of beakers, which were allowed to remain stationary for 15 minutes, that is, about the same length of time that the ordinary particle of sulphide in flotation remains in contact with the oil. Solvents were then added in a similar manner and the results obtained are given in Table III.

CYANIDING FLOTATION CONCENTRATE WITH OIL REMOVED. Alcohol and gasoline gave the best results in dissolving the oil and were therefore used with the flotation concentrate in the next series of tests. The concentrate was visibly cleaner after washing than that which had

<sup>6</sup>M. & S. P., Nov. 29, 1915.

TABLE III

Solvent	Solvent effect with different oils			
	Crude pine-oil	Pine-tar creosote	Wood-creosote	Coal-tar creosote
Hot water	None	None	None	None
Alcohol	Complete	Complete	Complete	Complete
Ether	Partly soluble	Partly soluble	Partly soluble	Partly soluble
NaOH (15%)	Incomplete	None	None	Incomplete
Gasoline	Complete	Complete	Complete	Complete
Acetone	Partly soluble	None	Partly soluble	Partly soluble
Benzene	"	Partly soluble	"	"
Carbon bi-sulphide	"	None	"	"
Hot soap solution	None	None	None	None

not been washed. This material was then weighed and cyanided as before. The results show a similarity in the recovery, namely, 60%, with both alcohol and gasoline. The increase of 5% over the result by cyaniding table concentrate in this case is a result of finer grinding, the pulp being ground to pass 150-mesh.

Constant factors used throughout are: weight of concentrate used 50 gm.; water 250 cc.; crude pine-oil 1%; KCN 0.5%; CaO 1%; agitation 18 hours; fineness 150-mesh:

TABLE IV

No.	Oil-solvent	Silver		Extraction %
		Head, oz.	Tail, oz.	
1	Alcohol .....	68.8	24.2	64.5
2	" .....	68.8	27.3	59.5
3	Gasoline .....	61.9	24.9	59.4
4	" .....	61.9	24.6	60.0

CONCLUSIONS. (1) Oil has no effect upon the cyanidation of ore in which the metals are not in the form of a sulphide. This shows that the trouble, in cyaniding flotation concentrate, is due to the oil-film on the sulphide particles. Furthermore, it is found that the oil has no effect upon the cyanide solution.

(2) The presence of oil in flotation concentrate hinders cyanidation because the sulphide particles are enveloped in a jacket of oil that prevents a good extraction by the cyanide.

(3) The film or covering of oil may be removed by some solvent such as alcohol, or gasoline.

(4) Heavy oils, such as pine-tar creosote, should be avoided, owing to their insolubility.

(5) Roasting at a low temperature will suffice for removing oil from a flotation concentrate containing gold, but, when treating flotation concentrate containing silver, a chloridizing roast at a low temperature must be used.

LATERIZATION is defined by J. M. Campbell as the process by which certain hydroxides, principally those of ferric iron, aluminum, and titanium, are deposited within the mass of a porous rock near the surface. Unless a rock contains uncombined alumina in the form of hydroxide it cannot be regarded as lateritic. Lateritic constituents are deposited in porous rocks between maximum and minimum vadose-water level only in places near the surface where oxygen can gain free access. Lateritic constituents are believed to be deposited in limited quantity in suitable situations in temperate climates. Rock, at the time laterization commences in it, usually contains no iron.

## Determination of Tungsten

\*To one gramme of the finely powdered wolfram in an 8-oz. beaker add 10 cc. strong hydrochloric acid, and agitate carefully to prevent caking. Add more acid (about 90 cc. in all), cover with a watch-glass, and boil briskly until the volume of acid is reduced to about 5 cc. Allow to cool, add 5 cc. strong nitric acid, and digest at nearly a boiling temperature for from five to ten minutes. Dilute with water to about 100 cc., allow to settle, and filter through a 9-cm. filter, wash with water, working so as to obtain as little tungstic acid as possible on the filter. To the beaker add about 10 cc. distilled water and 10 cc. dilute ammonia, adding the latter in small quantities down the sides of the beaker. With a rubber-tipped rod remove any deposit from the sides of the beaker into the alkaline liquor, raise to the boil, and stir well. If the suspended matter does not readily subside, boil again until the desired result is attained. Allow to settle, and while still hot filter through the original paper into an 8-oz. flask. Wash the beaker two or three times with small quantities of distilled water, decanting each time from any heavy mineral that may be present. Complete the washing of the filter-paper, and reserve the cover-glass, filter-paper, and beaker. Evaporate the solution of ammonium tungstate in the flask to a small volume, transfer carefully to a weighed platinum dish, and continue the evaporation to dryness on a water-bath. Ignite the dish and contents gently at first, and more strongly afterward. Weigh as tungstic acid. To the beaker containing the heavy residues add 5 cc. hydrochloric acid, cover with the original watch-glass, and boil till nearly dry; add a few cc. of nitric acid, and heat again for ten minutes. Dilute with water, allow to stand until the deposit has subsided, filter through a small paper, and wash the beaker and paper several times. Wash the filter-paper, also the original filter-paper, with a little hot dilute caustic-soda solution, followed by small washes of distilled water, and collect the alkaline liquors and washings in a beaker. If the watch-glass is stained with tungstic acid, dissolve with a few drops of the soda solution and add to the contents of the beaker. Raise the contents of the beaker to boiling, add about 2 gm. ammonium nitrate, and stir well while boiling. Filter through one of the papers previously used, and wash a little. Nearly neutralize the filtrate with dilute nitric acid, and a few cc. of mercurous nitrate solution, stir well, filter on a small ashless paper, wash, ignite, and weigh as tungstic acid. Add this weight to the weight of the tungstic acid in the platinum dish. Fine grinding is essential. One gramme is a convenient quantity, but with experience 2½ grammes may be taken without requiring any modification of the quantities given in the assay. The complete decomposition with the boiling hydrochloric acid takes about an hour.

\*A method described by H. W. Hutchin before the Cornish Institute of Engineers, and published in 'The Mining Magazine,' August 1917.

# Simple Methods of Finding [Density and Weight of Solids in [Mill-Pulp

By R. B. KILIANI

One of the simplest methods of finding the specific gravity or density of pulp is to use a 2000 cc. glass graduate with a sheet-iron top for cutting the sample as shown in Fig. 1. By knowing the tare or weight of the graduate, it is a simple matter to determine the weight of pulp in the graduate by weighing the whole thing on a scale reading in grammes. The specific gravity of the pulp can then easily be found by dividing that weight in grammes by the volume of the pulp in cubic centimetres. Knowing the specific gravity of the dry ore, the percentage of solid in the pulp can be found by the formula:

$$p = \frac{G}{G-1} \times \frac{a-1}{a}$$

Where  $p$  = per cent of solid;  $G$  = specific gravity of the dry ore;  $a$  = specific gravity of the wet pulp.

Another less accurate method for finding the specific gravity of a pulp and the per cent of solid present in it, capable of being used where there is not room below the discharge-spout or bell of the mill to insert the graduate, is to use a bucket about 10 or 12 in. diameter by 6 or 8 in. deep, with a narrow spout on one side for cutting the stream of pulp. A sketch of this bucket is given in Fig. 2.

A rod is indicated in the centre of the bucket; it serves as a gauge of the height to which the bucket should be filled. The volume of the bucket to the top of this rod can be found by finding the grammes of water required to fill it to that point. The weight of the wet pulp can then be found by weighing the bucket and the pulp, and the specific gravity of the pulp may be calculated as before.

Having ascertained the specific gravity of the pulp and the per cent of solid, the tons of solid in the amount of pulp handled in each 24 hours can be found by one of two methods. The first is to run the entire discharge of the mill into a barrel or tank for a definite number of seconds, taking the weight of the tank and pulp, and deducting the weight of the barrel, thus giving the pounds of pulp per second. From this the tons of pulp per 24 hr. can easily be figured, and, again, from this and the per cent of solid, as previously determined, the tons of solid handled per 24 hr. can be estimated.

Another method, which avoids weighing the pulp, is to use a tank below the launder leading from the discharge-end of the mill, with a gate to divert the pulp-stream into the tank at will. The gate should be so made that practically no time is lost in diverting or stopping the entire stream of pulp. This box or tank can be made to hold any desired quantity, and may be allowed to fill for any pre-determined number of seconds. By knowing the internal dimensions of the tank, the cubic feet of pulp can be computed from the depth

of the pulp-level below the top of the tank, this distance being measured with an ordinary rule. If the box is not level, it is best to fill it a few inches deep with water, so as to have a level bottom. This will also cover a gate or valve in the bottom for emptying the tank, and will avoid errors in computation due to such a condition. The actual depth of the pulp poured into the tank in taking the sample is then measured easily. The tons of solid handled per 24 hr. may be found by multiplying the volume of pulp in cubic feet by the number of seconds in 24 hr., by 62.5 (the weight in pounds of 1 cu. ft. of water) times the specific gravity of the wet pulp, times the per cent of solid, divided by the number

FIG. 1

FIG. 2

of seconds during which the sample was flowing, times 2000 (the number of pounds in 1 ton). This can be expressed as follows:

$$\text{Tons per 24 hr.} = \frac{\text{Vol. in cu. ft.} \times 86,400 \times 62.5 \times \text{sp. gr. of pulp} \times \text{per cent solid}}{\text{Time of sample in seconds} \times 2000}$$

The use of this formula can be simplified if a standard number of seconds is always used for the time of taking the sample, say, for example, 5, 10, 15, or 20 seconds. The tons of solid per 24 hr. then will be equal to a constant, times the depth of pulp in the tank in inches, times the specific gravity of the wet pulp, times the per cent of solid. Tons per 24 hr. = constant  $\times$  depth of pulp in inches  $\times$  sp. gr. of pulp  $\times$  per cent of solid.

The constant in this formula will be equal to the length of the tank in inches, times the width of the tank in inches, times the number of seconds in 24 hr., times 62.5, divided by 1728 (the number of cubic inches in 1 cu. ft.), times the constant period in seconds during which the sample was taken, times 2000; or, expressed in an equation:

$$C = \frac{L \times W \times 86,400 \times 62.5}{1728 \times T \times 2000}$$

Where  $C$  = the constant;  $L$  = length of tank in inches;  $T$  = time of taking sample in seconds; and  $W$  = the width of the tank in inches.

# Graphite

By L. W. BROOKS

The use of graphite in the industries of the world has been constantly progressing, not only in the amount used, but in the number and variety of its applications. Beginning in the middle of the sixteenth century through its utilization in the manufacture of lead pencils, followed perhaps a century later in the manufacture of melting pots, its sphere of economic adaptation has so broadened that today it occupies a distinct and important place in the world's industrial scheme.

The words graphite, plumbago, and blacklead, are practically synonymous, in that they refer to the same chemical substance. 'Blacklead' was probably the original term, and a comparative one, because it indicated the color of the streak made by this substance as compared with that made by metallic lead. Evidently it was so employed at an early period for writing or lining on paper. From the word blacklead the word plumbago naturally developed through the Latin. Graphite is derived from the Greek; and all these names have reference to its most remote use, namely, that of making visible markings on paper. Although these terms are synonymous, there have arisen special applications for them, thus, we import plumbago from the island of Ceylon, and, before the War, blacklead came from Germany, Austria, and Italy; at the same time, we export graphite from this country to the other countries of the world. There are lead pencils, plumbago crucibles, and graphite lubricants; blacklead stove-polish, plumbago foundry-facings, and graphite paint. This confusion of names may seem to be somewhat misleading, yet there is considerable method in the nomenclature.

Graphite may be regarded as occupying the middle place in the carbon trinity, charcoal and the diamond being the other forms, but it has its own individual characteristics, which make the number of its useful applications much greater than that of either of the others. Graphite occurs naturally in two forms, the amorphous and crystalline, each form being subject to variations due to the incidents of its occurrence. Amorphous graphite does not occur pure, but is always associated with other earthy materials, the character of which have great bearing on its use. Crystalline graphite shows great variations also, because of the distortion of its crystals during the process of formation. Crystalline graphite occurs both massive and with its particles disseminated through a containing rock; thus, Ceylon graphite occurs in large masses of crystals, while that coming from American deposits usually occurs as small laminated flakes disseminated through containing rocks. These differences of formation are made use of in the proper selection of graphite for its various uses.

At the present time the annual production of graphite for the entire world probably exceeds 100,000 tons, and of this amount probably 50% is of the crystalline variety and the remainder of the amorphous kind. Of the crystalline graphite, more than 80% comes from the island of Ceylon, and is amorphous, and also probably the same relative proportion comes from Korea. The remainder of the crystalline graphite is supplied almost wholly from the mines of Madagascar, New York, and Alabama. The Mexican graphite is of the amorphous kind as well as that from Rhode Island, and Canada. The localities mentioned furnish practically all of the graphite used, but it must not be understood that graphite is of rare occurrence. It is widely distributed, and the Mineral Resources of the United States, published annually by the Geological Survey, makes mention of production in the States of Alabama, Michigan, Pennsylvania, California, Colorado, Montana, South Dakota, and Alaska. It has been stated that there is probably as much carbon, occurring as graphite, north of the Mohawk river, New York, as there is south of it in the form of coal, but while it is so generally distributed it is rarely found so associated as to be available as a source of supply.

The first importation of Ceylon graphite into this country was made in 1829, by Joseph Dixon, of Salem, Massachusetts. Two years previous he had experimented with graphite from the State of New Hampshire, as a substitute for German blacklead, or pot-lead, as it was sometimes called, in the manufacture of crucibles. The success of his experiment was so pronounced that he secured a small shipment of Ceylon plumbago, samples of which he had previously seen brought back by sailors to the New England ports, for at that time Salem was a thriving centre of the East India trade. This was the first application of crystalline graphite in the manufacture of crucibles, which branch of the industry now absorbs somewhat more than one-half of the world's output of graphite. The range in the prices of graphite is greater than the range of the quality. The inferior grades of Korean blacklead sell as low as \$20 per ton in original packages in this market, while during the past year, crucible grades of Ceylon plumbago have sold higher than \$700 per ton; between these limits, certain grades of the Mexican amorphous graphite have brought higher prices than some of the inferior grades from Ceylon; the percentage of carbon in low grades of German and Austrian blacklead is as low as 40%, while fine grades of Ceylon sometimes run as high as 98% of carbon. The Ceylon product is imported directly by steamers in packages having net weights of about 600

lb. This is graded into lump, chip, and dust, the first grade consisting of the larger and softer pieces, while the last is much finer, and, of course, carries the bulk of the earthy impurities, while chip is a grade lying between the two. These grades are again sub-divided according to their brightness or 'boldness', as it is called, and their softness. About 50% of the Ceylon product is imported into this country, while England takes a smaller amount, the remainder being distributed between France, Japan, and Russia. The total output of graphite is consumed in something like the proportions indicated in the following table:

	%
Crucibles .....	55
Stove-polish .....	15
Foundry-facings .....	10
Paint .....	5
Lubricants .....	5
All others .....	10

The last item includes graphite for powder-glazing, electro-typing, steam-packings, and other minor uses. Of course, an exact apportionment would be quite impossible, and the figures are given merely as an indication of individual opinion. The uses to which graphite is put depend on the physical characteristics which it possesses, none of its uses, except that of a foundry facing, involving a chemical reaction. These physical properties are its infusibility at temperatures below that of the electric arc, its great capacity for absorbing and transferring heat, its comparatively high electrical conductivity, and its softness which may be defined as unctuousness. The latter expression may sound peculiar, but it describes the quality of yielding on contact with other surfaces, and that is the reason for its use in lead pencils, lubrication, powder-glazing, and stove polish, for example. It adheres readily to any surface with which it comes in contact and is highly polished by the slightest friction.

The use of graphite in the manufacture of lead pencils, which was shown to be the oldest, is now its most common one. The use of the lead pencil itself is universal. The first lead pencils were made from blacklead mined near Barrowdale, Cumberland county, England, and the first mention of them occurs in Conrad Gessner's work on 'Fossils,' dated in the year 1565. The method of manufacture was to cut strips of blacklead from larger pieces of mineral and insert them in grooves cut in small bars of wood. The product of this mine became extremely valuable, and it is stated that at one time its product sold for as much as 30 shillings per pound. Laws were promulgated, making robbery of blacklead pits a felony; and military escorts were furnished for the carts on their way from the mines to the works. This method of manufacture continued until Conte, of Paris, in 1795, devised the method of manufacture which is now universally followed. In this process the graphite and the clay are ground to the finest possible state of division, mixed, filtered, and formed into cakes by means of hydraulic filters; it is then again mixed by repeatedly

forcing it through plates perforated by many minute holes. It is then placed in hydraulic presses and forced through dies into the shape and size required. As it issues from the press, it resembles nothing more strongly than a long, round, black cord. It is laid out straight on boards, and, when dry, is cut into proper lengths. It is then packed into plumbago crucibles and fired in kilns. Red cedar is the wood most generally employed in pencil-making, although poplar is sometimes used for the cheaper grades, and for slate-spencils. The cedar logs are sawed into small slabs of the proper length for a pencil, and of a sufficient width for four, five, or six pencils. These are grooved lengthwise, the grooves being exactly the diameter of the lead which they are to receive. The leads are laid in the grooves and another similar block is glued firmly to it. The resulting slab is then run through shaping machines, which cut each individual pencil from the larger block. The pencils are then ready for varnishing, polishing, stamping, and whatever else is to be done to them. The grade of hardness depends upon the relative percentage of clay contained in the graphite mixture, the larger the amount of clay the harder the grade. Colored and slate-pencils are made in much the same manner, other pigments being substituted for the blacklead. For the manufacture of lead pencils the amorphous type of graphite is required. It is supplied principally from the mines of Austria and Mexico. The Mexican product has come into the market for this purpose only within the last few years, but it has rapidly taken the place of graphite from other sources. The pencil-making industry, although not consuming a great quantity of blacklead, is of considerable size, probably 15,000 people being employed in their manufacture in this country, Germany, and Austria.

As previously stated, the making of graphite crucibles absorbs more graphite than all the other uses combined. In this country, in England, and in France, the crystalline variety, mostly from the island of Ceylon, is employed almost exclusively in the manufacture of crucibles. In central Europe, Germany and Austria, blacklead is largely used for this purpose, sometimes without any admixture, but also in connection with the crystalline form in varying proportions. The use of plumbago in the manufacture of steel-melting crucibles in England is rapidly increasing, notwithstanding the existence of an easily available supply of good refractory material suitable for the manufacture of crucibles from clay.

Clay crucibles for steel-melting ordinarily last one heat, while plumbago crucibles will serve an average of five to eight heats. The difference is still greater when melting copper and composition metals, plumbago crucibles often lasting for thirty heats, treating 150 lb. at a time.

In outline the manufacture of crucibles is as follows: the components of the mixture, in a plastic condition, are put into a revolving mold, the interior of the mold having the contour of the outside of the crucible; a rib having its forming edge shaped like the inside of the

crucible and attached to the end of a lever, is drawn down inside of the revolving mold forcing the plastic mass into the desired shape. The crucibles are then dried thoroughly, this operation requiring from one to six weeks, depending on their size and the thickness of the walls. They are next set in kilns and fired, the temperature of the kilns being sufficient completely to eliminate the combined water from the clay. The crucibles are now ready for use, although the precaution should be taken, immediately before use, to anneal them sufficiently to drive off any hygroscopic moisture that may have been acquired during shipment or storage. The function of the plumbago in a crucible is somewhat obscure, but the principal one is that of its capacity to absorb and transmit heat. It is also infusible at temperatures short of that of the electric arc. The plumbago crucible is remarkable for its ability to withstand great shock, due to sudden changes of temperature. A crucible at white heat may be thrown into cold water without any apparent damage. Of course, this is an extremely severe test, and if repeated would eventually injure the crucible. When well made, crucibles give way through actually wearing out, that is, the repeated formation of slag on the outside of the crucible during successive heats, gradually reduces the thickness of the walls until they become too thin to carry the weight of the metal put into them. The forms of crucibles vary with special applications, for example, for liquid brazing, as applied to the manufacture of frames for bicycles, automobiles, and the like, a crucible, rectangular in plan, with the bottom sloping from the ends to a depth of eight to ten inches at the middle, is set in a brick furnace. Brazing metal is melted in the crucible and covered with a fluxing agent. The frame to be brazed is dipped into the molten metal for a minute or more, until the metal has had time to run into the farthest crevices of the joint. Previous to immersion, the parts of the frame near the joints are coated with a mixture of graphite with some quick-drying varnish like shellac. This coating prevents the adhesion of the metal to the surfaces so protected. Square and rectangular crucibles are also used for carbonization of electric-light filaments and for annealing purposes. Trays for 'blueing' and tempering screws and small machine parts, steel ladle-stoppers and nozzles, and retorts for the distillation of lead and zinc, are also made from the same materials as the graphite crucibles.

The practice of facing molds, in which castings are to be made, with some carbonaceous material, is general. The material used is usually anthracite, charcoal, or graphite. The reason for its use is to prevent the adhesion of the iron to the sand of the mold. The principle of its use for this purpose is as follows: the air contained in the mold, and which is carried in by the stream of molten metal, furnishes oxygen for the combustion of the carbonaceous material of which the facing is composed, so that a condition obtains analogous to that of the spheroidal state of a drop of water on a hot surface; thus the iron is effectually prevented from coming into

actual contact with the sand, so that when the casting is removed it will be found to be covered with a thin crust which will easily peel off, leaving the iron smooth and clean. In order to secure perfect results, two conditions must prevail, namely, first, the facing must adhere perfectly to the mold-surfaces. The hot metal coming in contact with the sand, dries out the mold, and if the facing has not been properly compounded, it will be washed away in front of the advancing metal, hence it is necessary to have a certain percentage of clayey material mixed with the facing to prevent it 'running' before the metal; second, it must be slowly combustible. If the facing burns quickly, trouble is likely to ensue from: (a) too great a volume of gas to be readily vented, causing 'blows' and 'cold shuts'; the latter term being applied to those cases where the iron has not filled the mold, and (b) where combustion is too rapid, it is not likely to endure during the entire time that the metal is in the fluid condition, so that while at first the spheroidal condition exists, it ceases before the metal is solidified, thus giving opportunity for adhesion.

Castings which have been made in connection with the use of a facing well suited to the particular case are superior because of the finer surface-texture, and of the ease of cleaning and the lessened tendency to dull the cutting-edges of machine-tools. Plumbago is the one material that combines in a greater degree than any of the others, the requisites necessary to a good facing. It contains no volatile matter whatever, and it burns evenly and slowly, so that a smaller quantity may be used. It has in addition another quality; it can be polished, giving the smoothest possible surface to the mold.

It is probable that the most interesting use of graphite, viewed from a mechanical standpoint, is that of a lubricant. This is a comparatively new application, very little of it having been employed for this purpose earlier than 25 years ago. Much has been claimed for it as a lubricant, without pointing out the manner in which it operates. The crystalline graphite is the only form suitable for lubricating purposes. The amorphous kind is always associated with impurities; accordingly, when finely ground, the particles are liable to be compacted into a mass. The crystalline graphite on the other hand will not pack in this way. While any pure, soft, crystalline graphite is valuable for lubricating purposes, the laminated form is the one specially adapted for the purpose. The true function of graphite as a lubricant is to change the character of solid friction, the co-efficient of friction of iron on iron being changed to that of iron on graphite, which may be taken safely at 60% less. The laminated form is most suitable for lubricating purposes, because it adheres so closely to the surfaces with which it comes into contact. The laminated or flake form, as it is prepared for market, is irregularly circular in shape, having an average diameter of 1/40-inch. The thickness of these flakes varies from 1/500 in. to a thickness too small to be accurately determined by a micrometer caliper; it is certainly less than 1/4000 in. From this it may be appreciated how closely these thin flakes become

attached to friction-surfaces. Graphite must not be considered as a substitute for oils or greases in lubrication. It would be foolish to claim that any solid friction could be as low as that of the fluid friction of mineral-lubricating oils or greases, but there are cases where the latter fail and others where the admixture of graphite is of the greatest benefit. As with all good things, discretion must be used in applying it. The greatest error consists in using it in too great quantities. The broad flat flakes will stand a large amount of wear before being destroyed. Furthermore graphite may not be used in connection with oil, where the operation of the oiling device is based on the capillary principle, because the graphite will clog the tubes and entirely interfere with the lubrication. One valuable feature of graphite in lubrication is that a bearing so lubricated is not liable to 'seize' while running hot. The oil may burn out, but the graphite comes into play and effectually prevents adhesion of the friction-surfaces. Graphite also has a number of special uses, such as in air cylinders, type-setting machines, lace machinery, where oil stains are to be avoided, on piano and organ-actions, and other places where the use of oil must be avoided. Perhaps no more remarkable illustration of the lubricating qualities of graphite can be cited than its effect on tile-roofs, near the sorting-compounds in Ceylon. These tiles are set at an angle less than that of repose; the winds carry the dust from the plumbago compounds and drive it into the crevices of the tile-roofs, and so change the angle of friction that without warning the roof comes sliding down.

An exceedingly important use to which graphite is applied is the process of electro-typing, in which it serves a double purpose. The process of electro-typing as applied to the art of printing consists in making a wax-impression of a type-form or a half-tone cut or engraving, and then depositing copper thereon. Graphite is applied to the face of the wax-case to prevent the adhesion of the type-form. For this purpose it must be very fine, and of such a character that it will not pack in masses that would cause minute blotches on the mold. Its second function is to supply a conductive coating to the surface of the mold. This is done by highly polishing the surface with graphite by means of fine hand brushes. Graphite for this purpose should be of the greatest purity and fineness. When a case so prepared is immersed in the electro-plating vat, a deposit of copper begins to form at the connecting points and extends over the whole surface that has been polished with the graphite. This may take from 20 to 40 minutes. In some cases, where the finest results are not wanted, and where time is to be saved, a chemical deposit of copper is first precipitated on the form. This is done by pouring a solution of sulphate of copper over pure iron filings upon the surface of the mold. Copper is deposited on the surface, but only where there is a graphite coating. Such a coating reduces the time required to deposit the coating in the electro-plating vat, but the quality of the electrotpe so made is not so good. Many attempts have been made to

find a substitute for graphite in this process, but so far without success.

Considerable quantities of crystalline graphite are used for glazing gunpowder, in order to prevent the absorption of moisture, which would result in caking. This is done in a large tumbling-barrel, the powder and graphite being tumbled together for a number of hours until the correct polish has been obtained.

Stove-polish is also one of the common articles in which graphite is used in large quantities. It consists of two components, the graphite which imparts the polish, and the clay binding-material which holds it in place. Amorphous blacklead can be used without any admixture, but the addition of crystalline graphite gives a more brilliant but grayer lustre, and one that is more enduring.

Within the past decade the use of carbon as a pigment in the paint industry has steadily increased, and the form of carbon usually employed is graphite. The great durability of paint made from lamp-black and linseed oil is well known, but it possesses the great disadvantage of drying with extreme slowness. Paint made with graphite as a pigment seems to have all the durability of lamp-black with the advantage of drying in a reasonable time without the addition of excessive 'dryer.' As a pigment graphite is absolutely inert, producing no injurious effect on the oil, and it is not subject to any change as the result of exterior conditions. One peculiarity of graphite paint is the extreme ease with which it may be worked out under the brush. This is due to the same quality that makes it a good lubricant. The workman finds himself spreading it out properly in spite of himself, it being actually easier to spread it than to apply heavy coats. For the same reason, it is possible to use a larger volume of graphite than of heavier pigments, without materially reducing the spreading capacity of the paint. Amorphous graphite is not as well suited for paint as the crystalline form, because of its earthy impurities. Of the crystalline varieties, the laminated is superior, for the reason that the surface of the oil exposed to destructive influences is least. The action of the brush in spreading the paint causes the flakes to lie in their natural position, that is, flat and overlapping each other, so that only the edge of the oil-film is exposed.

Crystalline graphite is used for polishing the bottoms of racing-craft, and more than once has been brought into requisition in preparing large steamers for their speed-trials. Graphite is also used to furnish body to hold the dye, in the manufacture of felt hats, the amorphous kind being used for this purpose.

A close examination of an incandescent electric lamp will reveal two small black lumps of graphite at the point where the filament joins the platinum wires. A certain kind of amorphous graphite, ground into a fine powder and made into a paste, is applied to this connection and baked hard.

Rods, plates, and pieces of different forms, and having a great range of electrical resistance, are made from mixtures of graphite with some non-conducting binder.

Thus two pieces of the same size may have conductivities in the ratio of 1:100,000. This material is used as a substitute for wire where high resistance is desired in a limited space.

Finally graphite is used as a substitute for red-lead on threaded joints, gaskets, and similar connections. Its advantages for this purpose are that the mixture never sets hard as does red-lead, and the joints may be readily opened, even years after they have been put together; also, due to the lubricating quality of the graphite, the pipes may be screwed up at least a half-turn more on an average.

Mention should be made of the method for the artificial production of graphite devised by A. G. Acheson, of Niagara Falls. The process consists in the production of carborundum in the electric furnace, and then, by prolonged heating, decomposing it and setting carbon free as graphite. Thus made it has the gray color and lustre of the natural crystalline form, but it lacks the same smoothness and softness when pulverized, probably due to the fact that the transformation has not been complete. This process is used successfully for the graphitization of electrodes and brushes, first formed in the ordinary way from coke, with such other materials added as are necessary for the production of carborundum. The durability and efficiency of electrodes are greatly increased by this treatment.

## A Useful Chart

THE accompanying chart may be used for computing the velocity-discharge in a V-ditch, based on Kutter's formula, where  $n$  is taken as 0.0225, which is a safe

VELOCITY RATE AND QUANTITY DISCHARGE FOR V-DITCHES

average for well-made earth-ditches in fair maintenance. The chart was constructed by George Henry Ellis. From the chart, for example, a V-ditch flowing 1 ft. deep and having a slope of 0.001, or 5 ft. per mile, the velocity is 1 ft. per second and the discharge 1.5 cu. ft. per second.

## First-Aid Instructions

\*Be calm. Take command and give orders.

Find location of the injury.

Know what you want to do and do it.

Keep onlookers away from the patient.

Look for red spurting blood and check it by tourniquet or by pressure of finger over blood vessel.

Look for shock; if present, lower head of patient, apply blankets and wrapped hot-water bottles; and give aromatic spirits of ammonia in water, if patient is conscious.

Look for fractures; never remove a patient, unless absolutely necessary, until splints have been applied.

Place bandage compress over compound fracture before applying splints.

Cover all wounds with bandage compress and bandage.

The fingers or instruments should not touch a wound.

Remove a foreign object from a wound, if you do not have to put your fingers into the wound or touch the edges of the wound.

Exclude air as quickly as possible from burned surfaces by using picric acid gauze or other material.

Leave reductions of dislocations or fractures for the surgeon, except dislocation of jaw or finger.

Only part of your work is completed when the patient is ready for the stretcher.

Unnecessary or rough handling of a patient may undo all your work.

Slowly place patient on stretcher, avoiding jerky movements, and carry him to safety.

Don't touch a wound with your fingers or any instrument.

Don't put an unclean dressing or cloth over a wound.

Don't allow bleeding to go unchecked.

Don't move a patient unnecessarily.

\*From Advanced First-Aid Instructions for Miners, U. S. Bureau of Mines.

## Heavy Blow to Mining Companies

This is the heading of an article in the 'Boston News Bureau', in the course of which that paper gives a statement made by Henry D. Williams, counsel for the Minerals Separation company. We reproduce it because it is interesting, but with the warning that it represents the hopes of the patent-exploiting corporation rather than a conclusive statement of the case. Mr. Williams says:

The effort of the Miami Copper Co. to reach the Supreme Court having been abandoned, two proceedings follow as mere matters of form and inevitably. One is a permanent injunction against the Miami Copper Co. restraining further infringement of the three patents in suit, the first patent for flotation with the use of a small quantity of oil, the second patent for flotation with the use of a solution frothing agent dissolved in the ore pulp, and the third patent for flotation with the use of phenol or cresol in the cold and without acid.

In my opinion this will absolutely prevent the use of the flotation process in any form, with Callow cells now installed, or with any other contrivances. The comfort which Mr. Callow has derived from the opinion of the Philadelphia Court has been solely based upon what that court said as to the oil patent. That court said as to the solution patent that the claims "are not confined to a particular device or a particular degree of agitation" and that the means for bringing about the agitation are "described in terms that are wide and inclusive," and then, quoting the specification itself:

"The air or other gas is to be 'liberated in, generated in, or effectively introduced into the mixture,' in order that the ore particles may come into contact with the gas and as a result may float to the surface in the form of a froth or scum which can be separated afterwards by any well known means. The object of introducing the air or other gas into the mixture is such agitation of the pulp as will produce the desired froth, but the claims are not confined to a particular device or a particular degree of agitation."

I may further add that the difficulties which the Philadelphia Court experienced as to the limitation of the first or oil patent to some particular degree of agitation were all swept aside in the Butte case and shown to be directly contradicted by the very terms of the patent itself.

As to the accounting, the plaintiff is entitled to all of the profits attributable to the infringing acts. The Miami Copper Co. added flotation at the tail end of its plant to recover metal from material formerly thrown away. All of that recovery is therefore due to flotation, and Minerals Separation, Ltd., is entitled to all of the profits of that recovery.

The Miami company has filed in court sworn reports covering the period from October 5, 1916, to the first of August and showing that the total value of the concentrates recovered by flotation during that period was \$2,765,672. They commenced to use flotation in Decem-

ber, 1913, and thereafter put in their pneumatic or Callow plant, and commenced to operate this in August 1914. We roughly estimate that their total recoveries in flotation amount to \$5,000,000, that the costs of flotation were very small indeed, and the difference between the actual cost and the value constitutes the profits due to infringement to which Minerals Separation are entitled.

The accounting will proceed before William H. Mahaffy, the clerk of the court, who has been appointed master by consent of parties to conduct these proceedings. He will summon the defendant before him and proceed to a complete examination of their accounts for the purpose of determining the profits due to infringement. He will have full access to all of their accounts, and can call before him any of their officers and employees to obtain the necessary information. The accounting will be comparatively simple.

The master's report will be filed, and after approval by Judge Bradford an appeal can be taken to the Court of Appeals, which will, however, only consider questions involved in the accounting. This decision will be final and unappealable, although the losing party will have the right to ask the Supreme Court to call the case up for review.

In the meantime, however, the Miami company will be under injunction, and the most that it can do is to pile up in dumps, subject to deterioration, the valuable tailings from its water concentration plant now treated by flotation and go back to the conditions which prevailed in the plant before flotation was adopted. The patents in suit expire respectively November 6, 1923, June 28, 1927, and June 9, 1931. Until these patents expire the Miami company will be absolutely bound by the injunction and can use flotation only with the consent of the owners of the patents.

In the Butte & Superior suit the sworn reports filed in court by the defendant covering the period from November 1, 1913, to date, show profits of about \$20,000,000 due to flotation. In this instance, the costs of operating the flotation plant appear in the statements and show that they are considerably less than 6% of the value of the concentrates.

The Utah, the Chino, and the Ray proved their flotation operations with complete tabulated statements in their efforts to help the Butte & Superior Co., so they have supplied evidence of their infringement and its extent. The monetary values have not yet appeared, but will undoubtedly be very large. The fact that the Nevada Consolidated has also infringed was also proved.

Under the patent laws the patentee is entitled to all of the profits due to the infringement. If, for any reason, the profits cannot be determined, then he is entitled to damages, and the best measure of damages is the royalty usually charged to licensees. Obviously a court will not compel a patentee to take from an infringer merely the compensation willingly given to him by licensees except as a last resort in the event that the profits due to infringement cannot be determined.

## Mining in Utah

By L. O. HOWARD

Last month I referred to the measures being taken to relieve the threatened coal shortage. Following the appeal to the Federal authorities and the meeting of railway officials with local boards, the principal coal carrier agreed to furnish more cars to Utah mines, asking only for time in which to move the accumulation of through-freight already consigned to it, after which coal was to receive preferential treatment. The recent damage to track by wash-outs has been repaired. The railroad has started to gather all sorts and conditions of cars for the coal traffic. The effort is rather belated. Meanwhile coal mines have been forced to operate far below normal, organizations have become scattered, labor has been employed elsewhere, and the return to full capacity is bound to be slow.

The railroad now charges \$1.60 per ton on lump coal from Carbon county to Salt Lake City, and \$1.35 on slack, and has petitioned the State Utilities Commission for permission to increase the rate to \$1.75 and \$1.50 respectively. Local commercial organizations are opposing the increase as does the city of Salt Lake, asking in turn for a reduced rate, \$1.30 and \$1.20. The city further charges that present rates are excessive, and that discrimination in the distribution of cars has been one of the principal causes of the threatened shortage. Concerning this discrimination it is alleged that coal mines served by the Denver & Rio Grande railroad in Colorado have been given preference in the distribution of cars, and that the rate from the mines to points on the Los Angeles & Salt Lake route beyond Salt Lake is only \$1.25 per ton.

The railroad in its petition admits the discrimination in rates, but bases its rights on an old tariff that has never been repealed.

The coal resources of Carbon county have been expanded several-fold in the last few years. New mines are opened at frequent intervals. Railroad facilities have not maintained equal progress.

In August the coal companies demanded transportation for 14,500 tons of coal per day. The average now being hauled is about 7000 tons. The discrimination in distribution of cars has also been made the basis of a suit before the Interstate Commerce Commission on the part of the independent companies in Utah. A hearing has been set for October 5. The purpose of the suit is to compel railroads serving Pacific Coast points, especially California, and the Middle West, to reduce rates so that Utah coal may enter these markets. California has a rate of \$5.75 on Utah coal, and a reduction to \$4 is asked so that Utah coal may take the same rate as that from Wyoming. Damages are demanded on the ground that some Utah companies have received more than their share of cars at the expense of the independent companies.

The completion of the Utah Railroad from Carbon

county to Provo is looked upon as the solution of the transportation difficulty. This road is under construction by a subsidiary of the United States Smelting, Refining & Mining Co. The track and yards are nearly completed. War conditions have hampered the delivery of cars and locomotives. Those ordered last November have not been delivered. Upon investigation it is found that the Federal government has ordered the builders of locomotives to fill an order of 300 for France, then 1000 each for France and Russia, before making any domestic deliveries. The question was then taken up with the War Department and an order secured that, following the completion of the 300 engines for France, 9 be sent to the Utah Railroad. Of the 2000 cars ordered, not over 1500 are expected before November 1. The Utah Railroad will not be in a position to help the situation effectively until winter. The D. & R. G. is also prevented from getting much-needed equipment.

The fixing of prices on bituminous coal by the President has created many new problems. The outstanding feature is the favoring of consumers of domestic grades at the expense of factories, smelters, and other industrial plants. The average price received at the mines will be about the same. The increase in the price of slack at the mine from \$1.50 to \$2.35 offsets to a certain extent the decrease ordered on the larger sizes. Run-of-mine has sold for \$2.35. The Government's price is \$2.60. For points outside the State the prices have been 50 cents to a dollar higher. All are now on the same level. The net result is to benefit outside consumers as against those inside the State, especially industrial consumers, and to reduce the price to the householder a few cents per ton.

The Workmen's Compensation Act has been in force two months, but some questions as to its interpretation are still unsettled. One of the first questions to arise has been the right of operators to ensure in companies charging a lower rate of insurance than that asked by the State Industrial Commission for State insurance. The Scranton Leasing Co. of Tintic took out a policy on July 1 ensuring 30 workmen in a company that charged \$5 per \$100 of monthly payroll. The Commission was notified and on July 26 the policy was filed. It was rejected by the Commission, which stated that the policy could not be received "since the rate is \$5.59 per \$100 of employee's payroll and the policy provides a rate of \$5 per \$100 of employee's monthly payroll." The Commission asserts that under the law it has the right to take this stand; further, the policy was a participating one that the Commission cannot accept. The leasing company claims that the Commission's power is limited to fixing the rate for insurance by the State, and has applied to the Supreme Court of Utah for a writ of mandamus compelling the Commission to re-instate the policy. This move may be regarded as but another attack on the excessive rate for metal mines established by the Commission.

Another question concerns the right of mining companies to deduct a certain sum per month from each em-

ployee's wages for the maintenance of a co-operative hospital. One provision of the Act prevents any deduction from employee's wages for any purpose. The issue is clean-cut between the legal prohibition of any co-operative arrangement, however much desired by both parties, and the unconstitutionality of a provision that prevents the execution of a previously arranged contract between employer and employee. The miners are said to favor the old arrangement, since better attention and conveniences are available at the co-operative hospitals. The individual commissioners are also said to favor the old system, believing that the employee receives services that he could not afford to pay for otherwise. A friendly suit may be instituted to test this particular provision of the Act.

The lead producers met late in August to discuss the request of the Government for one-fifth of the production in August, September, and October, at 8 cents per pound. A committee was appointed to investigate the probable cost of this lead in view of the high wages for labor and increasing cost of supplies. The effect of the new taxation will also be considered. Some of the producers think that if a possible loss is to be taken on this business the stockholders of the companies concerned should be first consulted.

The smelters have been so congested with lead ore that during the second week in August the American Smelting & Refining Co. requested shippers to suspend shipments for a week and then to go slowly until the congestion could be relieved.

Once more has the Utah Copper set a new record for loading at Bingham. On one day late in August there was loaded 47,600 tons of ore, exceeding the previous mark by 1600 tons. During August the average was 37,500 tons per day. Reports for the first quarter were recently issued by the Ohio Copper Co. They show net earnings of \$180,122 for the period. A 3000-ton flotation plant is under construction, 1500 tons of which may be ready in January. A saving of 80% is anticipated, against the present recovery of 47%.

In July the Park City mines shipped a record tonnage of 8449 tons. August tonnage has exceeded this, although final figures are not available. The California-Comstock mine, since resumption of operations on July 20, has shipped regularly and new discoveries of ore near old workings are of frequent occurrence.

The Big Four Exploration Co., one of the enterprises founded on the large tailing-dumps below Park City, has not yet been able to show a profit. The mill was described in the MINING and SCIENTIFIC PRESS of September 25, 1915. The plant was not a success and has been repeatedly remodeled. At a recent meeting of stockholders, directors, officers, and creditors, the affairs of the company were found to be in a most unsatisfactory state. No trial-balance has been cast since last December, but liabilities are estimated at over a quarter of a million dollars. Although, after the mill resumed operations in April, the manager signed a statement that profit was being earned at the rate of \$10,000 per month,

it has been shown that the net result of operations from April until the mill closed early in August was a loss of \$10,000. At no time has a profit been earned, yet a dividend was paid. The stock was boosted to \$2 and is now quoted at 5 cents, with a 10-cent assessment in the offing. Assets of the company consist of a mill, reported to have cost \$300,000, and \$40,000 to \$50,000 worth of concentrate and ore, also a few hundred thousand tons of tailing, value unknown. Naturally there is much dissatisfaction at the turn in the affairs of the company, and so far responsibility for the unfortunate state of affairs has not been fixed. A committee was appointed to investigate all phases of the fiasco, as well as to test the tailing for a suitable process, to report at a later date. This is the end of an ambitious project to treat the hundreds of thousand tons of tailing scattered over a space four miles long, 500 ft. wide, and 2 ft. deep, involving the use of drag-line excavators, steam-shovels, and industrial railways.

Shipments from Tintic in July were 38,600 tons, all smelting ore. This district has shipped nearly 300,000 tons in seven months, 32 shippers being represented. This is a remarkable showing for a district that has been producing ore for nearly 50 years, considering further that all of this ore has gone to the smelters. In August nearly 40,000 tons was shipped.

In Little Cottonwood the orebody of the Columbus-Rexall continues to improve. Ore was first found along the bedding of the limestone, and was two feet thick. In 50 ft. it thickened to 10 ft. Since the fissure is about 50 ft. ahead it is expected that it will continue to increase in thickness up to that point. Fifteen teams are hauling ore to the smelter at Murray. Eight cars had been shipped up to the end of August. The Michigan-Utah settled for 59 cars of ore in August, although there was difficulty in getting cars. The Alta-Germania reports the beginning of shipments in a small way. The Peruvian Consolidated reports the opening of four feet of \$75 ore. All the companies are handicapped by the shortage of teams and the inadequacy of railroad equipment. Some investigation of the molybdenite deposits in Little Cottonwood is being made. These deposits have been known since early days, but lack of a steady market and the metallurgical problem have made their exploitation unattractive.

In Big Cottonwood the Cardiff is sinking a shaft from its 600-ft. level; this has been in ore for 500 ft. The company is shipping 125 tons per day, but is having many difficulties in transportation.

In Dugway district the Metallic Hill, Golconda, Bertha, Laurel, and Cannon groups are being developed, and the last two have started shipping. In Deep Creek the Western Utah is shipping 275 tons per day from its Gold Hill properties. The company shipped 4760 tons in August. The output of the Pole Star, Woodman, Spotted Fawn, and Silver King brought the total for the district to over 5000 tons. At Ferber the Big Chief group has been developed to the shipping stage. The shaft is now down 45 ft. in \$75 silver-lead ore.

# REVIEW OF MINING

*As seen at the world's great mining centres by our own correspondents.*

## LEADVILLE, COLORADO

### INFLUENCE OF HIGH SILVER PRICES.—RESUMPTION OF WORK IN MINES.

With the high silver-market prevailing and indications pointing to a continued demand for the white metal, mining in the Leadville district is resuming the activity that marked operations prior to the strike. With the exception of two companies, the Yak M. M. & T. Co. and the Empire Zinc Co., all of the large mines have resumed and have produced a combined output of 51,000 tons in August. The Yak company is operating on a small scale as compared to that before the labor trouble, but it is stated by company officials that plans are now being perfected for new development. The extension of the main adit north into the Vega ground, previously developed through small winzes, is being considered. Such an undertaking would open an area that is known to contain ore.

The Empire Zinc Co., operating the Robert Emmet and McCormick properties in Stray Horse gulch prior to the strike, has abandoned operations for the present. These mines were recently purchased from the Small Hopes-Boreel Mining Co. for \$750,000 and are considered to be the richest lead-zinc and silver producers in the district. The Mikado shaft of the Iron Silver Mining Co. is now producing lead-zinc sulphide and zinc carbonate at the rate of 150 tons per day. This output will be increased as the orebodies in the lower portions of the R. A. M. property are being developed. Electric-driven centrifugal pumps will be installed during the month. A new ore-house and boiler-room is now under construction at the Mikado and will be completed in October.

The Greenback mine in Graham Park is again operating at full capacity. At the Wolfstone shaft, the Western M. Co. is shipping 200 tons per day of zinc carbonate and lead-zinc sulphide. In the lower workings several large bodies of sulphides were discovered which have been under water for many years. These sulphides are rich in zinc and lead and some carry silver. They are being blocked out by drifts and the output will be increased during the next month. It is reported that a few new orebodies of carbonate ore have been opened by recent prospecting.

Cramer & Co., leasing a large tract on Carbonate hill owned by the Star Con. M. Co., are undertaking a new enterprise of great interest to local mining men. A new 200-ton mill, for the separation of lead from the low-grade lead-iron ores occurring in large bodies in the Star properties, is being erected and the first unit will be in operation by October 1.

Mining at the Star properties has been resumed. The Cramer lease is shipping 200 tons per day of high-grade manganese ore. This tonnage is being hoisted through the Star, No. 5, and Ladder shafts. At the Waterloo No. 1 and No. 2, zinc carbonate is being produced by the Cramer interests and at the Yankee Doodle and Catalpa a large tonnage of iron is being shipped. M. L. Buchanan & Co., leasing from the Star Consolidated, are extracting 100 tons of manganese ore per day from the Porter shaft. Recently large bodies of silver-bearing iron ore have been developed and the lessees are preparing to double their output by adding 100 tons of the silver ore to the present production. The operators of the Seneca have discovered several large deposits of manganese ore on the upper levels. High-grade lead-silver ore has also been

found in this mine. Shipping will be started during the present month at the rate of 50 tons per day. The output will be increased.

The Louisville mine on Iron hill, owned by E. A. Hanifen and W. O. Reynolds of Denver, and for many years considered the richest silver producer in the Leadville district, is now operating on a larger scale than ever before and is producing 200 tons per day. Stopes of silver-bearing ore, carrying as high as 6000 oz. per ton, have been opened in past years. These stopes are now being re-worked and quantities of low-grade

LEADVILLE AND VICINITY

ore are being recovered. New orebodies have also been discovered recently. Preparations are being made to increase the output to 300 tons per day. A shortage of railroad cars has interfered with the attainment of larger shipments.

M. A. Nicholson and associates, operating the Tarsus mine on Yankee hill, have discovered several orebodies of high-grade lead-silver ore and iron oxide assaying high in silver. The discovery was the result of a well planned prospecting campaign. The orebody was opened on the 335-ft. level. A 4-ft. vein of lead-silver ore is being mined on this level. Shipping will start with an output of 50 tons per day. The Ponsardin mine, in which a rich orebody of lead-zinc sulphide-ore was discovered two years ago, is again in ore. A blanket-vein of silver ore, 30 ft. thick and assaying from 45 to 75 oz. per ton, has been recently discovered. The vein dips slightly to the north-east into a large undeveloped area. The mine is under lease to W. E. Bowden & Co. An output of 100 tons of lead and zinc ore per day has been maintained during the past two years.

Lessees at the First National mine in Iowa gulch have recently made a rich strike on the bottom level of the shaft at a depth of 330 ft. A 6-ft. vein of ore, assaying 60% lead and 40 oz. silver, has been cut, and shipping has commenced. The ore-shoot is reported to be well defined.

## TONOPAH, NEVADA

### WAGE AGREEMENTS.—DEVELOPMENT.—PRODUCTION.

Labor day was observed here, and all the mines and mills were closed down, but no public demonstration was held. In November 1916 the miners and mill-workers asked for an increase in wages, justifying the request by the price of silver and the increase in the cost of living. The mine-operators' agreement to a 50-cent increase per day while silver remained at 70c. or above was accepted. The increase commenced December 1916. The continued rise in the price of silver and the cost of living has prompted the miners and mill-workers again to suggest another increase in pay. They ask for a minimum wage of \$4.50 per day for muckers and \$5 for miners, the present wage, and an increase of 25c. per day for each 5c. increase in the price of silver above 70c. Under their proposal the wage at the present quotation of silver would be \$5.50 for muckers and \$6 for miners. The mine-operators will give an answer to the proposal on September 5, and a satisfactory arrangement will be reached. For the week ended September 1, the development and production follow.

The Tonopah Extension Co. milled 9476 tons of ore during July, making a net profit of \$36,225. During the past week 49 ft. of development was made in the No. 2 shaft and 120 ft. in the Victor. The south cross-cut on the 1630-ft. level has been started. It is expected to intersect the Merger, O. K., and Murray veins. The weekly production was 2380 tons.

The Tonopah Belmont during the past week produced 2431 tons of ore. A raise from the south cross-cut on the 900-ft. level intersected the South vein and exposed a width of 21½ ft. showing fair assays.

The Tonopah Mining Co. shipped 25 bars of bullion valued at \$47,500 from the plant at Millers. Increased development has resulted in 127 ft. at the Silver Top, 65 ft. at the Sandgrass, and 19 ft. at the Mizpah. A station is being cut at the 1500-ft. level of the Sandgrass and a north cross-cut will be started. The production during the past week was 2350 tons.

In the Jim Butler mine, cross-cut 754 is being driven to intersect the 648 vein. Raise 2 on the 850-ft. level intersected a vein of low-grade quartz. The weekly production was 800 tons.

The West End Con. M. Co. continues to develop the Ohio by raises and cross-cuts. Raises 513, 517, and 523 are all in ore, while 555, intermediate, is being driven to intersect the vein. The usual weekly progress was made in 717 D.3 to the east, 717 D.2 to the west, and 680 D.2. The production during the past week was 1109 tons.

The Monarch Pittsburg has commenced stoping on the 900-ft. level, as the raise, that was recently connected, gives ventilation. The Rescue-Eula produced 193 tons during the past week, the Montana 48 tons, the Cash Boy 53 tons, and miscellaneous 10 tons, making the week's production at Tonopah 9374 tons with a gross value of \$164,045.

## TORONTO, ONTARIO

### RELEASE OF MUNITIONS WORKERS.—MINING DEVELOPMENT.

The release of 75,000 munitions workers, caused by the curtailment of the work at a number of munitions plants, will materially relieve the labor situation in mining districts.

The Hollinger Consolidated has discontinued its weekly statements and little information of its operations is obtainable. The central shaft is in operation. At the Schumacher M. & M. Co. operations have been resumed. The addition to the mill, bringing the capacity up to 300 tons per day, will not be completed before October. The McIntyre, at present the only dividend-payer in the Porcupine district, has declared another 5% dividend. At the Newray a strike has been made in the cross-cut on the 400-ft. level. The vein is 5 ft. wide and assays \$20 per ton. The Dome Lake is stoping ore from No.

3 vein on the 400-ft. level. Diamond-drilling indicates ore in this vein at a depth of 600 ft. Operations at the McRae mine have been suspended after sinking a 100-ft. shaft. The Whelpdale, comprising 160 acres near the Hollinger, is being developed. A number of strong veins have been found and a shaft has been sunk 20 ft. Assays show \$7 gold per ton. The Beaver Consolidated has paid the third installment of the purchase money for the Kirkland Lake, leaving \$75,000 to be paid. Work on the Black claim, at Kirkland Lake, has been temporarily suspended owing to the closing of the plant from which compressed air was supplied. At the Wright-Hargraves the shaft is almost 300 ft. in depth. The vein, cut at a depth of 200 ft., was persistent and carried a high gold content. The United Kirkland, a newly organized company, has obtained a group of claims known as the Dodge-Ellis in the Kirkland Lake district. Surface work on the Canadian Kirkland has discovered 17 veins, some of which give high assays. The Trethewey has ordered a Callow flotation plant of a capacity of 100 tons per day. It has 60,000 tons of tailing on hand. The McKinley-Darragh has cut a new high-grade vein, averaging four inches in width, on the 350-ft. level and has intersected the extension of the Cobalt Lake fault-vein on the 400-ft. level. The Provincial has been re-opened under the management of John Redington. A shaft is being sunk at the south-west end of the area. The La Rose Consolidated is sinking an open-pit between two old veins, from which the high-grade ore has been extracted, and is mining low-grade ore, of which a large tonnage is available. Owing to the high price of silver it can be profitably mined. At the Adanac a series of rich veins has been developed, one of which, from three to ten inches wide, has been proved for 125 ft. and carries high-grade ore. The Seneca-Superior, which ceased operations in May 1916, has made its final annual report, showing a realizable surplus of \$7709. During its activity it produced \$2,191,280 and paid dividends amounting to \$1,579,817, equal to 326% on the capital issued.

## CRIPPLE CREEK, COLORADO

### AUGUST OUTPUT.—DIVIDENDS.

The production of the Cripple Creek district for the month of August totalled 102,269 tons, with an average value of \$11 per ton and a gross bullion value of \$1,137,323.96, an increase of 15,122 tons and \$16,328.80 as compared with July. The local plants treated 53,880 tons of low-grade mine and dump-ore with a gold content of \$2.11 per ton, from which was recovered \$112,783. The ore disposition and values are:

	Tons treated	Av. value per ton	Gross bul- lion value
Golden Cycle, Colo. Springs...	33,000	\$20.00	\$660,000.00
Portland, Colorado Springs...	10,688	20.32	217,180.16
Smelters, Denver & Pueblo....	2,600	55.00	143,000.00
Portland, Victor mill, Cripple Creek district .....	19,500	2.24	43,680.00
Portland, Independence mill, Cripple Creek district....	34,380	2.01	69,103.80
Rex Mill, Ironclad lease, Crip- ple Creek district.....	1,700	2.00	3,400.00
Rubie mill, Kavanaugh & Co., Cripple Creek district....	400	2.40	960.00
	102,269	\$11.12	\$1,137,323.96

Dividends paid during August were limited to the monthly distribution of the Golden Cycle M. & R. Co., 3c. per share, total \$45,000, and the Cresson Con. G. M. & M. Co., 10c. per share, total \$122,000. Both will pay their regular monthly dividends at the same rate on September 10.

The August output from mines of the United Gold Mines Co. was the heaviest on record, 3200 tons, a gross value of

\$65,800. The mines are operated under a liberal leasing system. The Trail mine on Bull hill produced 81 cars, 2800 tons of an average value of \$20 per ton. The W. P. H. mine, Iron-clad hill, was credited with 9 cars; the Bonanza, Battle mountain, 3 cars; and one car was shipped from the Deadwood mine on Bull hill. The Granite Gold Mining Co. mined and shipped from its Dillon mine on Battle mountain, during the month of August, 2360 tons of ore of an average value of one ounce gold per ton. This company will pay its second bi-monthly dividend of one cent per share, \$16,500, on September 15. Lessees of the El Paso Consolidated Gold Mining Co., 10

cut a station and commence development. The company, a close corporation, is controlled by Michigan parties, represented by Frederick G. Lasier, of Detroit.

The following directors were re-elected at the annual stockholders meeting of the Cresson Con. G. M. & M. Co. held at Colorado Springs on September 4: A. E. Carlton, Leslie G. Carlton, Cripple Creek; Charles M. Macneill, Spencer Penrose, E. P. Shove, Colorado Springs; Irving T. Snyder, T. B. Burbridge, Adolph F. Zang, and C. K. Boettcher, Denver. A. E. Carlton will remain at the head of the company as president.

### HOUGHTON, MICHIGAN

GOVERNMENT COPPER PRICE.—LABOR SCARCITY.—AUGUST OUTPUT.

The cost of copper production at the mines of the Lake Superior region will be higher in 1917 than it was in 1916 by at least 10% on the average and higher by 20% in specific instances. The prospective Government price is disturbing producers. A price of 25c. per pound will reasonably permit continuance of operations. A 20c. price will close down a number of smaller mines. Costs last year were higher than they have been, but this year everything that enters into the cost of production has advanced. Labor is not efficient.

The Winona mine has completed arrangements for its coal supply, securing Illinois coal at a fair price. Winona has difficulty in keeping sufficient men on the pay-rolls. Operations will be suspended if the price of copper is not fixed above 20 cents.

Effort will be made to have the Seneca shaft and the collar under cover so that sinking may continue uninterruptedly during the winter of 1917-18. The shaft collar will be of concrete and steel will replace timber in many places in the shaft. The surface-plant buildings all have modern equipment.

Cost at the Hancock Consolidated is 20c. per pound. A substantial reduction can be expected only when the working-force is doubled and the rock output increased.

A decrease in Wolverine's next dividend is anticipated. One of the problems that has come up in the past two years is the presence of a large amount of epidote, the specific gravity of which causes it to lower the grade of the concentrate. No. 4 shaft now has reached a depth of 4500 ft. Its north openings are in a good grade of rock.

Four levels, the 23, 24, 25, and 27, are in rock that is up to the average of the Victoria, the 11th level being in poor-grade rock. The company has 300 men employed and could use 500. The production is under 100 tons of refined copper per month.

Southerly levels of the old Osceola Con. mine continue in a grade of rock better than the average, but these levels are the only openings in this part where the showing is particularly good. The tonnage from the two shafts operating here is under 14 pounds per ton. An 18c. copper price, at present costs, would necessitate closing down the mine.

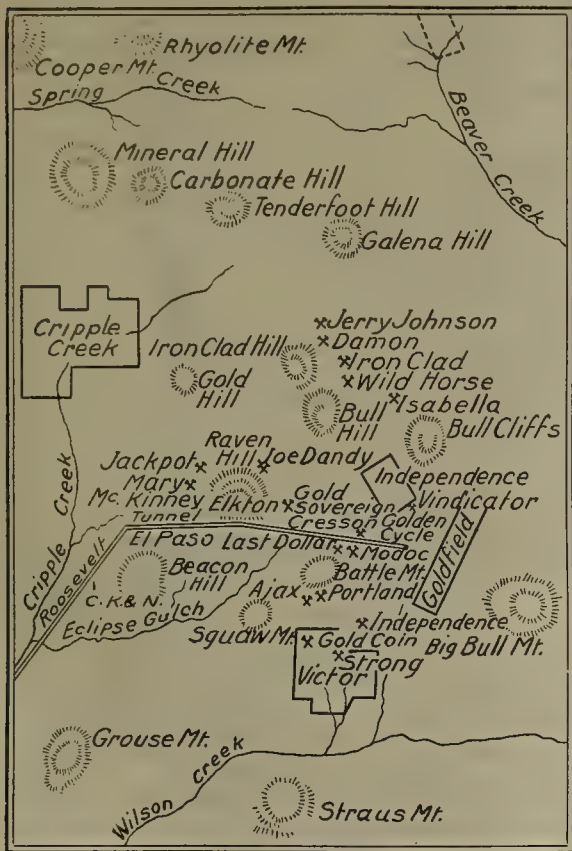

Butte miners are returning to the Lake Superior region.

Four electric trams are in operation at the Allouez and production is maintained notwithstanding the shortage of tram-labor.

Tonnage at the Ahmeek is 3700 per day as compared with 4000 tons last week.

Estimated rock outputs for August are: Calumet & Hecla, 244,400; Centennial, 11,600; South Lake, 5185; Isle Royale, 70,000; Osceola, 100,000; La Salle, 15,615; Hancock, 32,800; Mass, 16,000; Superior, 10,000; Ahmeek, 103,400; Wolverine, \$28,980; Mohawk, 48,090; Franklin, 27,045; Allouez, 48,465 tons.

The most noticeable increase in August is at the Stanton mines and at Allouez. Mohawk sent more rock to the mills in August than in July and it was better grade. Rock from the southerly openings is showing an improvement in quality and now averages better than 20 pounds without much selec-

THE CRIPPLE CREEK DISTRICT

in number, shipped from its Beacon Hill mine 530 tons of \$20 ore to the Golden Cycle mill in August. The Jerry Johnson mine, of the Jerry Johnson Mines Co., operated by two sets of lessees, shipped 350 tons of ore in August. The Caley lease ore averaged \$30 per ton. The Cripple Creek Deep Leasing Co.'s ore, mined below the Caley block, averaged \$20 per ton. Shipments by the Komat Leasing Co., from the Victor mine on Bull cliffs, are leaving bi-weekly and 10 cars to date ranged from \$8 to \$20 per ton. The mine is managed by Math Korf of Cripple Creek and is owned by the Smith-Moffat Mines Co. of Denver. The Caledonia, sold by the late W. S. Stratton to a London syndicate and now owned by M. Doran of Denver, is again shipping. H. M. Hardinge of Cripple Creek, lessee, is mining and shipping a good grade of mill-ore. Machinery, hoist, and a boiler have been hauled to the Roanoke mine on Mineral hill. A leasing company headed by William McPhee will operate the mine. The Millasier Mines Corp., owning and operating the Clyde on Battle mountain, has sunk the main shaft to the 1000-ft. point and at 125 ft. additional depth will

tion, while the run of the mine is approximately 19 pounds. Wolverine increased rock output by 3000 tons in August and the grade of rock was half a pound better.

Calumet & Hecla is constantly increasing its output of copper from the sand of Lake Superior. One-eighth of its total output comes from the old Torch Lake sand and is costing less than six cents per pound.

Silver is coming to be more and more important to Quincy as a source of income, not so much because of the rise in the price of silver, but because of the increasing amounts that are found in the lower openings. In the early days of the Quincy 'picking' silver was one of the important branches of work in the stamp-mill. Not until recently did the silver commence to reappear again to an appreciable extent. Calumet & Hecla's lower conglomerate workings likewise are showing more silver right along.

No. 4 shaft, North Kearsarge (Osceola Consolidated), has resumed operations after a short shut-down. The shaft continues in a grade of rock which is low in copper, not much better than that which is secured from the old Osceola lode. There is reason for the belief that there will be an improvement when the shaft intersects the Wolverine and Allouez ore-shoot.

At the South Lake, a higher copper-content is showing in the second shaft. The daily output is 200 tons and the August output 85,000 lb. refined copper. Coal-dock improvements at the Calumet & Hecla are nearing completion. The steel work on the addition to the leaching plant at Lake Linden is nearing completion and this part of the plant will be in operation early in the spring.

### MONTERREY, MEXICO

TAXES.—RESUMPTION OF MINING.—TRAFFIC CONDITIONS.

An effort on the part of the government authorities to enforce the collection of the exorbitant taxes that have been placed upon mining properties promises to have a disastrous effect upon the industry, according to advices that have been received here from many of the larger producing districts. It is stated that in a great number of instances the owners of mines have temporarily abandoned their properties rather than comply with the Government's demand for taxes. It is claimed that these taxes are almost equivalent to the confiscation of the properties. In cases of Americans and other foreigners who own mines, they have made protest to their respective governments against the alleged oppressive taxes. In several of the districts the Government has already taken over some of the mines upon which taxes have not been paid, and permission has been given to Mexican miners to work the different properties for their own profit. It is said that this practice has become quite general in the State of Sonora.

The Alvarado Mining Co., which is an American-owned concern, is preparing to resume extensive development operations of its mines in the Parral district, State of Chihuahua. Its holdings include the famous Palmilla mine which was discovered by the peon, Pedro Alvarado, who amassed a big fortune from the property before he sold it to the Alvarado Mining Co. The operations of the company have been conducted intermittently under some trying conditions during the long revolutionary period. Assurances have been given by General Francisco Murgía, commander of the military division of the State of Chihuahua, that ample protection will be given to the employees and officers of not only the Alvarado Mining Co. but of all other concerns that resume mining operations in that State. It is reported that the large smelter of the American Smelting & Refining Co. at Chihuahua will be placed in operation again in the next few weeks. Orders have been placed for coke and when these shipments arrive, the smelter will be blown-in. Some of the mines in the Santa Eulalia district near Chihuahua have recently resumed operations and

it is anticipated that there will be no lack of ore to keep the smelter supplied. The Peñoles Copper Co. and other German-owned mining corporations in Mexico are unusually active at this time in producing oil and in enlarging their mineral holdings. According to advices received here the ore output of the mines in the Mapimi and adjacent districts where the German investments are very large, is greater than it has been for many years. Several promising mines in the Guanajuato district have been recently acquired by German interests and similar investments have been made by men of wealth of that nationality, who already have large business interests in Mexico.

The traffic condition of the railroads of Mexico has improved considerably during the last few weeks and the smelters which are in operation are not meeting with the difficulty which they

formerly had in obtaining ore-shipments promptly. The equipment is being gradually increased by the re-building of old freight cars and the reconstruction of the motive power.

Conditions in the State of Durango, which for a long time were too dangerous on account of the operations of bands of brigands and revolutionists to permit the carrying on of mining development, are said to have improved very much within the last few weeks. The division of the National Railways of Mexico which runs between Torreon and Durango will soon be open for regular traffic, it is announced, after a suspension for more than three years due to the unsettled condition of the country through which it passes. With the restoration of traffic on this division, it is expected that the smelter of the American Smelting & Refining Co. at Velardeña will resume operations. In the San Dimas and other districts which are far removed from railroad transportation, being in the heart of the mountains of Durango, some of the mines have been operated without interruption during the revolutionary period. These properties have enormous quantities of ore and bullion ready for shipment.

# THE MINING SUMMARY

*The news of the week as told by our special correspondents and compiled from the local press.*

## ALASKA

(Special Correspondence).—B. L. Thane, manager for the Alaska Gastineau Mining Co., states that the rumor of the contemplated shut-down of the mine is without foundation and that as long as the men can be obtained to handle the reserve-ore the property will be operated. The problem confronting the company is a shortage of labor. The company needs 200 more men and can use 250 more than are now employed.

The Gypsum mine on Chichagoff island is again in trouble. Excessive quantities of water, which for a time were under control, are now flowing into this mine and the management is confronted with a difficult problem.

The Mohawk Mining Co., of the Willow Creek district, has let a contract for the driving of a second adit, 200 ft. long. The new adit will be started 1000 ft. below the upper adit.

H. Emhard, of Anchorage, has acquired the Pearl group of claims on Archangel creek, in the Willow Creek district, and will let a contract for 150 ft. of development. The vein of free-milling ore is three feet wide and assays \$56 per ton. A vein of high-grade molybdenum ore from 8 to 36 in. wide has been found by the Hercules Mining Co. near the headwaters of Archangel creek in the Willow Creek district. The company is preparing to operate on a moderate scale.

Sulphur from the volcanic deposit near Bales Landing, Stepovak bay, 50 miles east of Sand Point, will be mined by the Standard Metals Co. of Los Angeles, and a crew of men will sack the sulphur preliminary to its haulage by two auto-trucks to a loading point.

Treadwell, August 26.

## ARIZONA

Charles F. Willis, of the State Bureau of Mines, is arranging extensive courses in mining and first-aid. M. A. Allen, of the Bureau, will assist in the search for rare minerals.

### COCHISE COUNTY

(Special Correspondence).—The Mascot mine, recently acquired by the American S. & R. Co., is shipping 100 tons of ore per day. Additional men are being employed and new machinery installed.

Willcox, August 25.

### GREENLEE COUNTY

(Special Correspondence).—The Rival Mining Co., operating in the Twin Peaks district, is rapidly sinking its new shaft. The shaft is 60 ft. deep.

The Carlisle Mining Co., at Steeplerock, is operating a new mill. The mill is treating 100 tons of ore per day and concentrating 4 into 1. Concentrate shipments are being made regularly.

Clifton, August 25.

### MARICOPA COUNTY

(Special Correspondence).—A deposit of manganese ore has recently been discovered by J. D. Peggs of Tucson, 18 miles south-west of Sentinel in the Eagle Tank mountains. The ore analyzes 44% manganese, 0.018% phosphorus, and 4% silica. The orebody is said to be 10 ft. wide and 1500 ft. long.

Phoenix, August 25.

### MOHAVE COUNTY

(Special Correspondence).—The Mary Bell strike, two feet of ore assaying \$125 per ton in gold, silver, and lead in the Chloride district, continues to improve. The Rattlesnake mine

has a carload of ore valued at \$60 per ton ready for shipment to the Selby smelter. There are places in the vein where 18 in. will average \$100 per ton in gold, silver, and lead. The shaft is down 160 ft. Both the north and south drifts are developing good ore. The New Mohawk has started shipping. The Payroll continues to ship 35 tons of ore per day to the Needles mill. The Schenectady continues to open up rich silver ore. It has been announced that a 600-ft. cross-cut will be started from the 1100-ft. level of the Golconda mine to explore the 800-ft. level of the Fredonia vein of the Union Metals Co. In the shaft, 60 ft. in depth, are two veins of 14 inches, which assay \$50 per ton. The Union Metals Co. also owns the Golconda Annex, which has opened up some very rich surface ore.

Kingman, August 25.

The Golconda, in Union basin, is being run in a most efficient manner by John D. Wanvig, a graduate of the Michigan College of Mines. At present the deepest workings are at 1400 ft., where an ore-shoot 1000 ft. long in a 5-ft. vein is being worked. The pay-streak is from two feet to four inches. It contains brown zinc-blende, with silver and gold, the ore averaging 12% zinc, with \$8 in precious metals. This mine is doing well. The mill is being remodeled.

The Chamber of Commerce of Chloride offers to send to interested parties reports on the standing of mining enterprises in the Chloride district whenever possible.

### PINAL COUNTY

(Special Correspondence).—The Magma Chief Copper Co. is re-opening an adit for the purpose of developing a deposit of manganese ore. The manganese ore has been contracted for by a New York company.

Florence, August 25.

### YAVAPAI COUNTY

(Special Correspondence).—There is much activity in the Hillside district. At the Golden Burro mine the mill is operating steadily. Eight teams are employed hauling copper ore from the King mine to Hillside station.—A. E. Anderson, owner of the Silver Butte group in the Thumb Butte district, has arranged the transfer of his property to a group of Los Angeles financiers and a company will be organized. The property has over 1000 ft. of development. The Silver Con. Belt M. Co. is employing 12 men in shaft-sinking. It is expected that ore shipment will commence in September.

Prescott, August 25.

## CALIFORNIA

### COLUSA COUNTY

The 100-ton amalgamating plant of the Cerise G. M. Co., Charles Austin, superintendent, was destroyed by fire September 3. The plant was valued at \$20,000 and contained a rock-breaker, 6-ft. Hardinge ball-mill, Senn amalgamating tables, and a 50-hp. gas-engine.

### PLUMAS COUNTY

(Special Correspondence).—The Great Western Power Co. has completed its electric transmission line from Las Plumas to Veramont, a station on the Indian Valley railroad, and will soon start the delivery of power to the Green Mountain, Crescent, and other mines near Crescent Mills. The line will also supply the Engels copper group in the winter. An extension of the line to the mines near Genessee is expected.

Th farmers of the northern end of Indian valley have ap-

pointed a committee to confer with E. E. Paxton, manager for the Engels Copper Co. The farmers assert the tailing escaping from the mill-pond is ruining irrigation ditches and valuable land and demand remedial measures.

The Droge gold property, near Greenville, has been taken under option and lease by Eastern people and will be operated under the management of John W. Dailey. The Droge is equipped with an electric plant.

J. T. Buel, representing Marin county investors, has acquired the Quigley gravel mine, near La Porte. Prospecting has been in progress for several months and a wide body of blue gravel has been discovered.

Quincy, September 3.

#### SACRAMENTO COUNTY

The Pilliken mine, near Folsom, is mining and shipping chrome ore. Two trucks are used in transporting the ore to Folsom.

#### SAN BERNARDINO COUNTY

The Mohave Annex Tungsten M. Co. has completed and is operating a 20-ton mill on wolframite ore. Ore, 10 to 15% tungstic acid, has been developed.

#### SHASTA COUNTY

(Special Correspondence.)—The Clipper group of mines in Big Backbone district, west of Kennett, was bought at a sheriff's sale by C. C. Hartman.

The Forest Queen mine at Gibson, near Lamoine, is shipping a carload of chrome every three days. The Highland Lake mine at the same place is also shipping chrome in small amounts.

The El Oro company of Oroville is prospecting the Menzel ranch across the river from Redding.

The Afterthought Copper Co.'s flotation plant at Ingot was started September 1. The company has spent \$300,000 upon its plant. Twenty miners are employed at the mine and shipments of ore are being made to the flotation-plant over the half-mile railroad. George L. Porter is superintendent.

Redding, September 4.

The managers of three copper companies and the strikers' committee of eight reached no agreement at a meeting, September 5. The miners insist on an increase of one dollar per day and the offer to arbitrate wage-differences was rejected by the miners. Twelve hundred men are on strike.

#### SIERRA COUNTY

(Special Correspondence.)—The adit at the Wehe gravel mine, on St. Charles hill, has extended 750 ft. and is in soft ground. It is believed that the face of the adit is under the gravel deposit and a raise will soon be started. W. W. Caserly is superintendent.

The Kleffer brothers have purchased a 40-hp. engine, hoist, and duplex pump for the Gibraltar mine. The shaft is to be sunk to 310 ft. The gravel-channel was intersected at a depth of 160 ft., but the pitch of the bedrock necessitated additional depth. The gravel mined has been of excellent grade.

The air-raise at the City of Six quartz mine has been completed and the lower adit is being extended. The mine is owned by Henderson & Hodgkinson.

The main working adit of the Monarch, near Sierra City, is in 1650 ft. and is expected to intersect the main orebody within 750 ft. Upon its completion the adit will be used as the main outlet. The vein averages \$10 per ton in free-milling ore.

Work is proceeding at the Tightner, Mariposa, El Dorado, North Fork, Wisconsin, and other mines in the Alleghany-Forest field. Attention is being devoted to the development of milling ore.

Downieville, September 1.

#### SISKIYOU COUNTY

(Special Correspondence.)—The Salmon River Mining Co. has completed arrangements for extensive work at its hy-

draulic mine near the Forks of the Salmon. O. H. Poor has been appointed manager. D. P. Doak and associates of San Francisco are interested. The small stamp-mill, placed in operation at the Homestake mine a few weeks ago, is operating steadily and making a good gold-extraction. It has been decided to install a Huntington mill to increase the tonnage. Ore is delivered to the plant from the lower adit workings by a 1200-ft. tramway. Enough ore has been developed to keep the mill running two years. R. S. Taylor of Yreka is manager and owner. The eight-stamp mill at the Know-Nothing gold mine, near Happy Camp, has been completely overhauled. A large compressor has been placed in position and mining will in future be done with machine-drills. The water pipe-line has been improved and the mill will be operated by water-power. Sufficient ore is stated to be exposed to insure operation of the mill for three years. The property is controlled by W. B. Beall.

Arthur Coggins and associates are developing extensive chrome deposits near Dunsmuir, and a promising molybdenite deposit near Lamoine. A concentrating plant will be erected to treat the low-grade chrome. The high-grade is being shipped to the Carnegie Steel Co. and other Eastern manufacturers. Molybdenite is shipped to Denver, Colorado.

Yreka, September 8.

### COLORADO

#### CLEAR CREEK COUNTY

The Primos Exploration Co. has begun the operation of its Urad molybdenum mine near Empire. The work is under the management of Charles A. Chase. E. A. Strong will be superintendent. A mill will be constructed and will be in operation by the first of 1918. The first unit will have a capacity of 50 tons. The mine was developed two years ago.

#### TELLER COUNTY

(Special Correspondence.)—The strike made on the 2000-ft. level of the Portland Gold Mining Co.'s No. 2 shaft has been confirmed by the officials at Colorado Springs. In keeping with its conservative policy, however, no mention has been made of the rich core in the vein, a streak from eight inches to a foot wide, that assays several hundred ounces per ton. It was admitted in the official statement that 100-oz. assays were frequent.

The Leora V, on Newton hill, has been purchased by Harry Newton, president of the recently incorporated Victory Gold Mining Company.

The Elkhorn, on Carbonate hill, owned by the Star of the West company, has been leased to the Geraldine company. The mine has produced a small tonnage of high-grade ore, but has long been idle. The Zoe mine on the eastern slope of Beacon hill, controlled by James F. Burns, has been brought back to production by lessees.

A surface discovery of promise has been made on the Flying Cloud on the eastern slope of Bull hill. The property is owned by the Gold Pinnacle company, and the strike was made by a lessee, Tom Roberts of Goldfield.

W. A. Dewitt, of Lamar, Colorado, president of the Geraldine M. M. & D. Co. and leasing on the Elkhorn, Carbonate hill, will install a steam-hoist and a compressor. The shaft, 450 ft. deep, is to be developed.

Cripple Creek, September 1.

### IDAHO

The Con. Interstate-Callahan Mining Co., operating in the Coeur d'Alene, shipped ore having a net value of \$737,115 during the second quarter of the current year, according to a statement from John A. Percival, president. To this is added \$6385 in miscellaneous receipts, making the total net value of \$733,500. A deduction of \$324,513 for operating costs leaves a profit of \$408,986; less \$69,530 for improvements, leaves a surplus of \$339,456 for the quarter. The ore mined

was 43,298 tons, and the ore milled 35,474 tons. Its average content was 22.4% zinc, 2.3 oz. silver, and 6.5% lead.

The Big Creek Leasing Co., operating the Yankee mine in the Evolution district, has declared a dividend of 50c. per share, making a disbursement of \$2500, the capitalization being 5000 shares, par value \$10. Shipments were first made early in 1916 and have continued in increasing volume. The ore is said to have high silver-content.

A dividend of 10c. per share has been declared by the Blackhawk Leasing Co., operating on Government gulch near the property of the Coeur d'Alene Dev. Co., a subsidiary of the Stewart Mining Company.

The gross receipts of the Richmond M. M. & R. Co. in the Coeur d'Alene for August will be \$38,750. The rate of production was a car per day. The average value of the ore is \$1250 per car, according to the average of settlements on shipments in July. This is after the deduction of freight and treatment charges. The operating cost will be \$7000 for August, which leaves a net operating-profit of \$31,750.

The enhanced price of silver will increase the annual output of the Hecla to \$1,500,250. The ore averages 160 lb. of lead and 4.55 oz. of silver per ton. The output is 328,500 tons per annum. The company pays a monthly dividend of 15c. per share. The last monthly dividend, August 2, brings the total dividends to \$5,505,000. Shipments of lead-silver concentrates are being made to the Bunker Hill smelter at Bradley.

Serious forest fires are reported in five of the national forests of Idaho and Wyoming. Reports indicate the probable origin as incendiary.

The Yukon Gold Co.'s dredge on Prichard creek is nearing completion.

The mill of the Bluebird mine, United Mines Co., in Little Smoky district, will be ready to operate by September 15. It will have a capacity of 100 tons per day.

## MONTANA

The Intermountain Copper Mining Co., operating near Iron Mountain, Montana, will receive \$38,000 net for its August output according to Edward Evans, president.

### LEWIS AND CLARK COUNTY

(Special Correspondence.)—The prediction is made that the Barnes-King Dev. Co., operating mines in Fergus county and at Marysville, will produce gross returns of \$100,000 for the month of August. The principal production is expected to be made by the Shannon mine at Marysville. The orebody is exposed at a depth of 500 feet.

The St. Louis M. & M. Co., operating in Marysville, is milling 100 tons per day from the Drumlummon mine. The ore is reduced by a 25-stamp mill and a cyanide plant.

At the Bald Butte mine a new compressor has been installed and work is to be carried on.

David Blake is shipping ore from the Larson claim. The ore is silver-lead and is consigned to the East Helena smelter.

In the Grass Valley district six claims are in operation and shipments are going to the smelter at East Helena. The ore is silver-lead.

An important discovery of silver-lead ore has lately been made in the Wickes district. The find was made in the Maryland mine of the Comet-Rumley group. A cross-cut at a depth of 75 ft. was extended a distance of 85 ft. before encountering the hanging wall. Six feet of solid ore on the foot-wall was exposed. The Baltimore mine in the same neighborhood is shipping ore to the smelter.

In the Mt. Washington mine, which is developed by an adit 3000 ft. long, 15 ft. of galena ore is exposed at a depth of 800 ft. The output from the adit is one car per day. The Alta Mines Co. is developing a large tonnage. Old adits have been re-opened and a cross-cut has been extended from the bottom of an 800-ft. shaft beneath the old workings.

Helena, September 1.

## NEVADA

### ELKO COUNTY

(Special Correspondence.)—Preparations are being made for further tests of the shale deposits near Elko to determine their gasoline-content, and for the perfection of a process invented by A. C. Crane. It is stated that the Crane process facilitates the recovery of a maximum amount of gasoline and other oils from shale.

The Michigan group of lead-zinc claims on Battle creek, on the east slope of the Ruby mountains, has been taken under lease and option from Frank Shost by Backman, Blewett, and Woodward. The group is equipped with a 50-ton mill and arrangements are being made to operate it and to develop the deposit. The mill product assays 20 to 33% zinc, 11.5% lead, and 6 oz. silver. Bids for the construction of a road into Jarbidge from Twin Falls, Idaho, are being advertised for in Twin Falls newspapers, and it is stated an endeavor will be made to have the road completed before winter.

Elko, September 12.

### ESMERALDA COUNTY

The Southwestern Mines Co., S. H. Brady, manager, expects to have its new 200-ton mill in operation by October 1. The shaft of the company's mine, at Hornsilver, has reached a depth of 500 feet.

### HUMBOLDT COUNTY

The north drifts on the 800 and 900-ft. levels of the Rochester Mines Co. are advancing in ore. The bullion production for the first 20 days in August was valued at \$36,500. It is expected that repairs to the tramway will be completed by September 8.

At the Rochester Combined Co. development is proceeding. A compressor and Dorr cyanide equipment have been received and installation is under way.

Seven Troughs is producing ore from the 700 and 750-ft. levels. Preparations are being made to haul the ore to the Darby mill for treatment.

### LINCOLN COUNTY

(Special Correspondence.)—The Greenwood lease on the Amalgamated Pioche has opened a large body of silver, lead, and gold ore on the 400-ft. level of the Amalgamated shaft. Ten tons of shipping ore is being mined per shift. A compressor has been installed. It is reported that the Amalgamated management is preparing to drive a cross-cut on the 1200-ft. level.

The Virginia-Louise Mining Co. proposes a bond issue of \$60,000 to finance further development and equipment of its holdings. It is stated that 200,000 tons has been blocked out and that indications are favorable for the development of a larger tonnage of silver, lead, and gold ore.

H. M. Lansdowne will arrange for the resumption of work at the Pioche Mines group, two miles north. The mine is stated to contain large bodies of good ore. The scarcity of labor is interfering with the re-opening.

Activity is evident on the east side of the Ely range. The Ely Valley and Tulloch are producing, and lessees on the Pioche Metals group are developing good ore. The high price of silver has stimulated work and promises to cause the re-opening of several mines that have long been idle.

It is expected that the sampler at Jean will be moved to Salt Lake in the near future and its capacity increased to 600 tons per day. Negotiations are in progress and J. B. Jensen, the manager, is conferring with Utah producers. If the plant is moved, favorable freight rates to local producers are anticipated.

Pioche, September 2.

The Prince Con. M. & S. Co. will pay another dividend of 5c. per share, in the aggregate \$50,000. The total dividends disbursed amount to \$550,000. Diamond-drilling has been in progress for three months.

## MINERAL COUNTY

(Special Correspondence.)—The Mason Valley Co. will place the second furnace of its Thompson smelter in commission as soon as sufficient coke is on hand to insure steady operations, which will be within 30 to 60 days. A regular supply of custom ore has been guaranteed by operators at Luning, and in nearby districts. This includes copper, silver, and gold producers. The first furnace is operating on ore from the Mason Valley, Nevada Douglas, and Bluestone mines. High-grade copper ore has been intersected 150 ft. from the 1000-ft. level of the main shaft on the Calavada group, formerly known as the Giroux. Cuprite and tetrahydrite occur. The ore is the richest yet discovered in this field and the deepest point to which Luning development has been carried. Several stringers of rich ore have formed an orebody near No. 8 station in the Hahn adit of the Luning-Idaho, and work is proceeding to determine its extent. Arrangements have been made for shipments from the McDavitt shaft and Conte lease as soon as the second furnace of the Thompson smelter has been blown-in. Driving is progressing to develop rich silver-copper ore, outcropping on the Sophie, Monarch, and other claims. The sinking of a main working shaft will be started in the near future.

No. 1 shaft of the Copper Mountain mine, near Rand, has intersected the ore-zone, and drifts from the 150-ft. cross-cut are developing shipping-ore. The shaft on the Miller-La Patt lease has been deepened 150 ft. and ore is being shipped. Shafts No. 2 and 3 are being sunk to reach the orebody. The property is operated by the Jumbo Extension Co. of Goldfield. C. Koegel, superintendent of the Nevada Rand mine, expects to intersect the main orebody on the 450-ft. level. Ore has been exposed on the 150, 180, and 250-ft. levels. The company has decided to install a 25 to 50-ton mill. Conditions at Reservation Hill are improving. The Mountain View Co. is operating its small mill on a good grade of gold ore.

Luning, September 8.

## NYE COUNTY

(Special Correspondence.)—The preliminary work of the White Caps mill is satisfactory to the management. The feature which caused doubt was whether the temperature of the roaster could be regulated and held at the point where the refractory compounds, found in the White Caps ores, could be volatilized without fusing. The results have proved that the temperature of the roast can be maintained within 20 degrees of the desired point. It is officially announced that the first test-run on a -10-mesh product, after roasting and passing through the leaching plant, yielded an extraction of 87%. With this knowledge, after changes have been made in the crushing plant and by the addition of a trommel, already installed, to size the product, it is expected that an extraction of 90% will be attained in the mill. It already has been stated that the average will be 120 tons per 24 hours. It takes two hours for the ore to pass through the roaster and 72 hours is required in the leaching department of the mill. It is expected that the roasting time will be reduced. The first mill-runs have been made on ores lower than the average. Ten men are employed in the mill. In the mine the development for the week totals 146 ft. A large double-drum hoist has been delivered and will be installed.

Since the resumption of mining east of the working-shaft of the Union Amalgamated Mining Co., a total of 50 ft. of new development has been accomplished. The maximum water-flow encountered has been 100 gal. per minute and is being handled by the triplex station pumps.

The working-shaft of the Manhattan Consolidated M. & D. Co. has now reached a depth of 45 ft. below the third level. The formation encountered in the shaft is a hard, dark-blue, calcareous shale, the soft shale, struck at a point 75 ft. above the third level, having passed out of the shaft 20 ft. below the level. Until the shaft has been sunk 100 ft. below the third level, no further work will be undertaken in the mine, as the

development of the east orebody on the third level has been sufficient.

The joint shaft of the White Caps Extension and Zanzibar is being sunk in record time. It is a three-compartment shaft and has now reached a depth of 122 ft. The average speed in the sinking is maintained at six feet per day. Jack-hammer drills are used in the shaft. The size of the shaft is 6 by 16 ft. The Chicago pneumatic air-compressor is in place near the shaft. The compressor has a capacity of 314 cu. ft., sufficient for drilling and pump purposes.

The surface machinery recently purchased by the Red Top Mining Co. has been received and much of it has been already installed. The Cameron sinking-pump is ready to use. The two-stage Ingersoll compressor is in place and ready for operation.

Manhattan, August 20.

## STOREY COUNTY

Milling-ore is being developed by the Jacket Surface Tunnel of the Jacket-Crown Point-Belcher M. Co. A plant of 125 tons capacity per day is being erected. The equipment consists of a rock-breaker, Hardinge steel-ball mill, Dorr thickener, pachuca agitation tanks, and Oliver filter. Air-lifts are used to transfer the pulp. The Jacket Con Co. is controlled by the Sturgis interests.

## OREGON

## CURRY COUNTY

(Special Correspondence.)—The Chetco Mining Co. of Harbor is spending \$35,000 in erecting new machinery and building roads. The mine is situated on the summit of Mt. Emery, 12 miles east of Harbor, at an elevation of 3200 ft. The vein of free-milling ore is 60 ft. wide.

Harbor, September 4.

## JOSEPHINE COUNTY

(Special Correspondence.)—The decline in the price of copper has closed many of the copper properties in the Waldo district. The miners and equipment from these properties are being diverted to the production of chrome and other minerals. Every effort is being made to develop the production of manganese in Josephine and Jackson counties.

The Pittsburg-Oregon M. & M. Co. was incorporated last week. The office of the company is to be at Grants Pass, and a general mining and ore-marketing business is planned.

With the burning of the C. O. Power Co.'s sub-station in the Greenback district north of Grants Pass, the Greenback mine will suspend operation for ten days.

Grants Pass, September 4.

## TEXAS

## BREWSTER COUNTY

(Special Correspondence.)—Scherer and Whall have a claim-area of 800 acres near Shumla from which they have shipped 100 tons of manganese ore. They propose a weekly shipment of the same tonnage. The ore contains from 21 to 40% manganese and from 7 to 25% iron. It is shipped to East Chicago, Illinois.

Langtry, August 16.

(Special Correspondence.)—The large deposit of fuller's earth situated near here has been leased by J. C. Melcher to F. G. Lewis and C. C. Knight of Wichita Falls for a period of 25 years. It is stated that the lessees will install machinery and equipment. The mineral substances in this deposit is said to be of high grade.

O'Quin, September 1.

(Special Correspondence.)—The Texas Nitrate & Fertilizer Co. has been incorporated for the purpose of developing a large deposit of 'nitratine' or soda niter in Presidio county in one of the most arid parts of the upper border region. It is stated that the discovery was made by Charles Mitchell of Houston.

The deposit covers an area of two miles long, one-half mile wide, and a depth of 5 to 12 ft. Samples taken from various parts of the deposit give an analysis showing nitratine amounting to 11 to 45%. It is the theory of geologists who have visited the deposit that it was formed by an ancient guano bed which was covered by volcanic eruptions. The company has obtained a lease upon 2700 acres of land and is preparing to begin development operations. Associated with Mr. Mitchell are D. A. Gregg of Houston and others.

Alpine, September 1.

### UTAH

The Associated Companies, a company exclusively furnishing workmen's compensation insurance for coal mines, has entered the Utah field. E. C. Lee, with headquarters at Pittsburgh, and E. H. McCleary, inspector in charge of the western field, have spent 10 days inspecting mines in Utah. Negotiations are practically completed with the State Industrial Commission governing the methods of work of the companies. The base rate of the Commission is \$7.81 per \$100 of pay-roll.

UTAH

A mine complying with the merit safety standard of the Associated Companies can obtain 60% of the base rate or \$4.69.

The Eldorado G. M. & M. Co. has been operating since May in opening an old property 6 miles north of Ogden.

The Golden Reef Con. M. Co., in Beaver county, is developing a promising property. D. P. Rohlfing of Salt Lake City is consulting engineer. A new vertical shaft has been sunk to a depth of 450 ft. On the 400-ft. level the vein is 100 ft. wide.

The Cardiff M. Co., in Big Cottonwood canyon, is cutting a station at the 225-ft. level. A daily shipment of 125 tons of lead and silver ore is being made.

Stockholders, officers, directors, and creditors are endeavoring to disentangle the affairs of the Big Four Exploration Co.

It is asserted that frequent changes were made in the mill and the recovery was unsatisfactory. The liabilities are \$258,000 and the chief assets, a new plant, stated to have cost \$300,000, \$40,000 to \$50,000 worth of ore and concentrate, and the Ontario tailing dump.

### BEAVER COUNTY

The Golden Reef, operating four miles north of Frisco, has opened up a body of galena ore, which assays 30 oz. silver per ton and 32% lead.

The Carbonate Center, operating near Frisco, has encountered good grade galena ore. Electrical-driven equipment, supplied with current from the Beaver River Power Co., has recently been installed. A concentrating plant has been designed and a part of the construction material is on the ground.

A compressor has been purchased by the Indian Queen and cross-cutting in the adit is planned. Lessees are mining lead and copper ore from the upper workings.

The Imperial Mines Operating Co. has been organized to lease the Imperial group of claims, situated three miles west of Newhouse. A compressor and other necessary equipment has been ordered. The wagon road at Newhouse has been repaired. The organizers of the company are H. H. Adams, J. J. Brouher, E. E. Meyers, E. H. Street, and S. H. Fotheringham.

The Utah Leasing Co., working the tailing-dump at Newhouse, is treating 700 tons daily. The concentrate is shipped to International.

### GRAND COUNTY

A. M. Rogers is authority for the statement that from 600 to 800 tons of 2% uranium ore is awaiting shipment from Dry valley. Two 2-ton trucks will transport the ore to the railroad.

### JUAB COUNTY

August ore-shipments from the Tintic district reached 928 cars. The important shippers were the Dragon Con., Chief Con., Iron-Blossom, Mammoth, Centennial-Eureka, Grand Central, Eagle & Blue Bell, Gemini, Gold Chain, and Colorado Consolidated.

The north drift of the Connolly mine at Eureka has encountered a good body of ore assaying from \$55 to \$65 per ton in lead, gold, and silver. The drift was run from the 400-ft. level in the new shaft, and is one of the important developments in the Eureka district. The new Connolly shaft, projected to go 1000 ft., was sunk to the 400-ft. level before cross-cutting. The drift was extended north 100 ft., and intersected an ore-bearing zone. Several shipments, amounting to nearly 100 tons, have been made.

The Huebner property, recently sold to the Eureka-Utah Mining Co., of Salt Lake, is shipping regularly. Since acquiring this property the company has been working in ore of good grade that has now developed into carbonate and galena ores carrying gold and silver. Shipments run \$65 per ton in car lots. The property is owned by the Eureka-Croesus Mining Co. of New York.

### SUMMIT COUNTY

The August shipments of Park City mines totaled 10,919 tons. Production of over one thousand tons per month was made by the Silver King Coalition, Judge M. & S., Daly West, Silver King Con., and the Ontario. The Silver King Con. declared a quarterly dividend of 15c. per share, aggregating \$105,000 and bringing the dividend total to \$1,422,765.

### TOOELE COUNTY

A discovery of high-grade bismuth ore in the Pole Star mine has been reported.

### WASHINGTON

#### STEVENS COUNTY

Jesse M. Hall, secretary, reports a net smelter return, from three cars of ore from the Gladstone Mountain mine, of \$1778.69. The cars contained 102 tons.

The earnings of the Electric Point mine in July were estimated at \$60,000. This is sufficient to pay a dividend of 7c. per share. The surplus is \$300,000. The ore reserve is estimated at \$1,500,000.

### BRITISH COLUMBIA

(Special Correspondence.)—Four new shippers are shown on the statement of ore shipments to Trail last week. There are 34 shipping mines and the ore movement totaled 8327 tons, as compared with 7541 in the preceding week. The year's total tonnage to the end of the week is 224,279 tons. The mines which have shipped for the first time this year are the Gray Copper and Lone Bachelor at Sandon in the Slokan district, the Prince Henry near Greenwood and the Kamloops Agencies at Kamloops. Their shipments were respectively 37 tons, 7 tons, 18 tons, and 7 tons. Of the 34 shippers, 15 are in the Slokan and Ainsworth district, 2 in Rossland, 3 in the East Kootenay, 3 in the Boundary country, 1 in Nelson, and 7 in the United States. The heaviest shipper was the Sullivan mine at Kimberley.

Operation of the new mill at the Surf Inlet gold mine commences September 1 and it is intended to operate at full capacity, 300 tons per day. The Surf Inlet mine has been bonded to the Tonopah-Belmont Co., a new company having been organized with a capital of \$2,500,000.

Out of a total of \$1,500,000, the Tonopah-Belmont interests expended \$1,300,000. They have taken an option on the Pugsley mine, owned by the Princess Royal Gold Mines, Limited.

Vancouver, September 1.

The Slokan Star Mines, Ltd., operating near Sandon, B. C., shipped 775 tons of zinc-bearing ore and 185 tons of lead concentrate in the past three months. The zinc ore yields \$25 per ton after the deduction of freight and treatment charges, and the lead \$110 to \$125 per ton. The 775 tons of zinc concentrate had a net value of \$19,375 and the lead a value of \$20,350. The total value of the shipments is \$39,725. In addition the company has concentrates in storage valued at \$10,000.

Shipments of 26 cars of ore with a net value of \$68,351 are reported by the Highland Valley M. & D. Co., operating near Ashcroft, B. C., since beginning the production of ore late last year. Crude-ore shipments, made in 1916, total four cars containing 114½ tons, according to Fred Keffer, president of the company. The shipments of concentrate began in January, since which time 22 cars having a value of \$66,198 have been made.

### GUATEMALA

The Torlon Mining & Smelting Co. has been organized at Huehuetenanga, Guatemala, for the exploration and development of mines in the vicinity of that city. The general manager is Santiago Molina. Members of the board of directors are Santiago Molina, Teodoro M. Recinos, Federico Morales, Joseph Allan, and Juan F. Prem.

### MEXICO

The mine-owners and operators of the State of Durango, Mexico, are requested to organize a Chamber of Mines, which shall serve as a registry of all operating mines and their assets. The chamber is expected to make regulations for the welfare of the members, and every owner of a mining claim or of a possessory right in a claim is entitled to representation and a vote at the meetings. On the face of the announcement to the mine-owners there is nothing to indicate an official link between the proposed chamber and the State Government except that the object is to benefit the individual mine operators and principally the commonwealth that requires the utmost activity upon all known deposits of minerals. The call for the organization is signed by attorney Alberto Terrones Benitez, of the city of Durango.

## Personal

*Note: The Editor invites members of the profession to send particulars of their work and appointments. This information is interesting to our readers.*

DONALD F. CAMPBELL, of Seattle, is here.  
C. H. MUNRO and JOHN F. NEWSOM are in New York.  
W. J. ELMENDORF is in the Copper River district, Alaska.  
ROBERT E. CRANSTON is in Alaska on professional business.  
G. W. CUTTING has a commission in the Field Artillery, U. S. Army.

F. G. CLAPP has gone on a trip to Texas and other parts of the West.

F. B. FORBES has come home from Nicaragua to serve in the Army.

E. W. WESTERVELT is superintendent for the Hobson Silver-Lead Co., at Ymir, B. C.

GEORGE J. CARR has resigned as superintendent for the Yuba Consolidated Gold Fields.

ANDRES SALAS, a Peruvian mining engineer, is visiting flotation-mills in the West.

OLOF WENSTROM, of Boston, passed through San Francisco on his return from Arizona.

HOWARD D. SMITH has been examining the Jerome Verde property at Jerome, Arizona.

L. WEBSTER WICKES has received a commission as Captain in the Engineers Reserve Corps.

DONALD F. FOSTER holds a commission in the British army and is now stationed in Egypt.

DEAN B. THOMPSON, now with the Mason Valley Mines Co., was in San Francisco this week.

F. C. FRENCH has received a commission as Captain of Engineers in the Officers' Reserve Corps.

IRVING A. PALMER has been appointed professor of metallurgy in the Colorado School of Mines.

J. PARKE CHANNING is in the Michigan copper region, visiting the Naumkeag exploration operations.

SCOVILL E. HOLLISTER has been appointed resident manager for the Leviathan Mines Co., at Yucca, Arizona.

FRANK R. WICKS has succeeded W. H. JANNEY as mill-manager for the Chino Copper Co., at Hurley, New Mexico.

MARK L. SUMMERS, formerly dredge-foreman, has been appointed superintendent for the Yuba Consolidated Gold Fields at Hammonton, California.

A. G. LANGLEY, formerly with the Copper Queen Consolidated, is now resident engineer in the Revelstoke district for the Provincial Government of British Columbia.

EUGENE H. BARTON was born at Bartonville, Vermont, February 22, 1853, and died at his residence in Los Angeles on August 12, 1917. After graduating from the University of Louisiana, he went to Germany, where he took a two years' post-graduate course at Heideberg. Upon his return to the United States, he joined a civil-engineering corps engaged in railroad construction in Wyoming and Colorado. Later he went to Bodie, California, where he built and operated the railroad running from Bodie to Mono Mills. Later he was in charge of the operation of some of the largest mines at Bodie. In 1887 he became chief engineer for the La Grange dam of the Turlock irrigating system. Upon the completion of the dam, he resided at Sonora, in Tuolumne county, California, where he opened a civil-engineering office. About 1902 he went to the Yellow Aster mine at Randsburg, as engineer and later became superintendent of the property. Early in 1907 he became mine-superintendent for the Ray Consolidated Copper Co. at Ray, Arizona, but left there when mining operations were greatly curtailed owing to the panic of 1907, since which date his time has been devoted largely to general engineering practice.

# THE METAL MARKET

## METAL PRICES

San Francisco, September 11

Aluminum-dust (100-lb. lots), per lb.	\$1.00
Aluminum-dust (ton lots), per lb.	\$0.95
Antimony, cents per pound.	16.50
Antimony (wholesale), cents per lb.	15.25
Electrolytic copper, cents per pound.	28.50
Pig lead, cents per pound.	11.25
Platinum, soft and hard metal, respectively, per ounce.	\$105—111
Quicksilver, per flask of 75 lb.	\$115
Spelter, cents per pound.	10
Tin, cents per pound.	60
Zinc-dust, cents per pound.	20

## ORE PRICES

San Francisco, September 11

Antimony, 45% metal, per unit.	\$1.20
Chromite, 40% and over, free SiO <sub>2</sub> limit 8%, f.o.b. California per unit, according to grade.	\$0.60—0.70
Magnetite, crude, per ton.	\$8.00—10.00
Tungsten, 60% WO <sub>3</sub> , per unit.	\$23.00—25.00
Scheelite, highest grade, per unit.	\$26.00
Molybdenite, per unit for MoS <sub>2</sub> contained.	\$40.00—45.00
Manganese, Carnegie schedule less freight to Chicago. Less than 40% special quotation.	

Manganese prices and specifications, as per the quotations of the Carnegie Steel Co. schedule of prices per ton of 2240 lb. for domestic manganese ore delivered, freight prepaid, at Pittsburgh, Pa., or Chicago, Ill. For ore containing

Above 49% metallic manganese	Per unit \$1.00
46 to 49% metallic manganese	0.98
43 to 46% metallic manganese	0.95
40 to 43% metallic manganese	0.90

Prices are based on ore containing not more than 8% silica nor more than 0.2% phosphorus, and are subject to deductions as follows: (1) for each 1% in excess of 8% silica, a deduction of 15c. per ton, fractions in proportion; (2) for each 0.02% in excess of 0.2% phosphorus, a deduction of 2c. per unit of manganese per ton, fractions in proportion; (3) ore containing less than 40% manganese, or more than 12% silica, or 0.225% phosphorus, subject to acceptance or refusal at buyer's option; settlements based on analysis of sample dried at 212° F., the percentage of moisture in the sample as taken to be deducted from the weight. Prices are subject to change without notice unless specially agreed upon.

## EASTERN METAL MARKET

(By wire from New York)

September 11.—Copper is stronger and higher at 25.25 to 26.25c. Lead is dull and prices are a little lower at 10 to 10.25c. Zinc is quiet and nominal at 8.25c. Platinum remains unchanged at \$105 for soft metal and \$111 for hard.

Advices from Boston state that a purchase of 60,000,000 lb. of copper was made at 25c. per pound. This sale was made direct to the United States government, which acted as intermediary for account of the Allies. The hope is entertained that by virtue of the Administration's 'one-price-for-all' policy the Government will permit a price of 25c. for our own war requirements. The copper people expect to hear from Washington definitely this week. It is understood there are certain interests in Washington, heretofore prominent in Wall Street, who are laboring to secure a quotation of not over 22c. per pound. Notwithstanding heavy wage increases, high cost of coal and other materials, the copper-producing in-

dustry is confronted with the most formidable strike situation which it has ever been called upon to face. All of which lends force to the argument that anything less than 25c. for copper will be entirely out of line with \$2.20 wheat.

All activities of the Anaconda Copper Mining Co. in Montana have ceased, this condition applying both to mines and smelters. Copper production will be affected to the extent of 30,000,000 lb. monthly, and the output of high-grade spelter will be materially encroached upon. Earnings, of course, will be reduced to a minimum. Anaconda operates three copper refineries. Two of these in Montana were shut-down during the early days of the strike and all smelter product diverted to the Raritan refinery in New Jersey, which has been able to maintain operations, although at less than normal. The Washoe smelter has since closed, leaving as the active factors in this company's operations the Tooele smelter in Utah and the Raritan works. The International company's smelter in the Globe, Arizona, district has been closed for two months, thereby removing from monthly production approximately 36,000,000 lb. of copper.

## MOLYBDENUM

The New York market for molybdenum is unchanged and the price quoted is \$2.10 to \$2.20 per pound for 90% material.

## ANTIMONY

The New York market continues dull and lots have been offered by jobbers at 15% c. per pound, the nominal quotation for spot duty-paid antimony. Antimony ore remains unchanged with very little ore reaching this market. Needle antimony spot is quoted at 10c. per pound.

## MANGANESE

Manganese ore continues fairly strong at \$1 quoted on a basis of 48% ore or over.

## FINISHED STEEL PRICES

It is the common belief in the steel trade that the average price for finished steel during the June quarter was 34 1/4 c. per pound, or \$65 per ton net. Recent prices have been about 5% c. Should the average price for steel be settled on at \$65 per ton there is room for a 50% decline from present prices.

## Eastern Metal Market

New York, September 5.

The metals are all lower, with quotations in nearly each case nominal. Business is slacker than in many years and the market as a whole is nearly demoralized. Buyers are not anxious to buy and sellers are filled with uncertainty as to the future of prices because of Government price-fixing and are unwilling to commit themselves into the future. The result is a stand-off market.

Copper is lifeless and nominally a little weaker.

Tin is dull and featureless but steady.

Lead is stagnant and softer.

Antimony is quiet and lower.

Aluminum is dull and unchanged.

In the iron and steel market repeated postponement of action in arriving at some conclusion regarding price-fixing reveals the magnitude of the task. Additional data have been asked for from producers in the past week. The pig-iron semi-finished steel and rolled products markets continue to drift. Statistics for the August pig-iron output show how small has been the success of furnace-men to increase production. The output was 3,247,947 tons, or 104,772 tons per day against 3,342,438 tons in July or 107,820 tons per day—this in spite of the fact that five new modern furnaces were started in August.

### COPPER

Stagnation bordering on paralysis characterizes the copper market. Even the market in copper stocks has the disease and is experiencing a decided slump. The air is saturated with rumors regarding the price to be paid by the Government and its Allies, but the question is still undecided, at least so far as the public is concerned. Anywhere from 20 to 25c. per lb. is mentioned, but it is not even known yet what the final price is to be on the 60,000,000 lb. bought by the Government some months ago. Added to these disconcerting factors are labor troubles limiting production and law-suits cutting in on profits. It is no wonder that buying is paralyzed and that fear seizes the market. There is no buying reported, except spasmodic lots here and there which some consumer needs badly. Small quantities of prime Lake are reported sold at about 26c., New York, with September electrolytic changing hands on August 27 at 25.75c., New York, and October at 25.50c., New York, but these sales are unconfirmed. Prices in general are distinctly nominal. Yesterday both Lake and electrolytic were quoted nominally at 25.25c., New York, with variations from this, on either side, of  $\frac{1}{4}$ c. For the last quarter about 24 to 25c. seems to be the nominal range. There will be sold on the New York Metal Exchange at auction tomorrow 448,000 lb. of standard electrolytic for prompt delivery, 448,000 lb. for September, 448,000 lb. for October, and 448,000 lb. for November delivery. London prices remain unchanged at £137 for sp t electrolytic and £133 for futures.

### TIN

Activity is only spasmodic and the market is featureless. General basic conditions in other metals sympathetically affect the tin market. Inquiry and buying was fairly active on August 29 and 250 tons of Straits tin was reported sold at 61.50c., New York. Other sales off that day embraced metal, ex-steamer 'Foyle,' soon to arrive, at 60.87 $\frac{1}{4}$ c., New York; Straits tin, due in September, at 60.50c. and December shipment from the Straits at 57.12 $\frac{1}{4}$ c. A fair inquiry in futures developed on August 31, but no sales of consequence were noted. August 30 was practically a holiday, due to the city's testimonial to the New York National Guard and the market was neglected, though metal was offered at 61.75c., New York, with few buyers. After another holiday on Monday there was a

little inquiry yesterday which developed into sales of 100 to 125 tons, mostly spot with some sales of tin on the seas. The quotation yesterday was 61c., New York, that for August 30 and 31 having been 61.75c. The London market yesterday was £243 10s. per ton for spot Straits, a decline of 10s. from last week's price. Since Monday the London market has declined 30s. for all grades. Arrivals this month, including September 4, were 325 tons, with 4015 tons reported afloat.

### LEAD

The lead market is the only one really distinguished by a feature. This was the announcement by the American Smelting & Refining Co. of a reduction in its quotation which was lowered \$10 per ton or 50c. per lb. to 10.50c., New York.

The unusual circumstance attending this change was the statement that the company is willing to book orders without any string attached. The trade looks upon this as considerable of a change and as pointing to a liberal supply of lead. Whether the leading interest can make sales at this price is to be watched with interest. General conditions are not altered but prices are. In the outside market also quotations have declined with some selling reported at 10.37 $\frac{1}{4}$  to 10.25c., New York. Yesterday the outside market broke to 10.25c., New York, at which price at least one 100-ton lot probably changed hands. Buyers and sellers seem as far apart as ever, taking the market as a whole, and buying in no case is on a large scale. Buyers continue to hold off and no activity is expected until confidence in general business conditions is renewed. Recently October metal has been offered at 10.25c., St. Louis, and November at 10c. London quotes £30 10s. per ton for spot lead and £29 10s. for futures.

### SPELTER

In the absence of any sustained demand the market continues stagnant and weak. Prices, which are almost entirely nominal, are unchanged at 8c., St. Louis, or 8.25c., New York, for prime Western. For the last quarter, where quotations are obtainable they range from  $\frac{1}{4}$  to  $\frac{1}{2}$ c. higher. The market is very difficult to judge. Some sellers quote as low as 7.75c., St. Louis, for September delivery, with others quoting from 8 to 8.25c. and above. There are some who ore in a weakened position and are selling or quoting under 8c., St. Louis, but the amount of business done at these or any other figure is very small. The market is demoralized. Sellers as a rule will not part with metal at near or under the cost of production, nor will buyers enter the market when price-fixing uncertainties are the dominant factor. It is certain, however, that consumption is still going on here and abroad and that a demand is accumulating which will some time express itself in renewed buying on a large scale. This is the only ray of hope.

### ANTIMONY

Chinese and Japanese grades are lower in the absence of any pronounced demand. Duty paid, New York, the quotation now stands at 14.50c. per pound.

### ALUMINUM

The market is weak and unchanged at 47 to 49c. per lb., New York, for No. 1 virgin metal, 98 to 99% pure.

### ORES

TUNGSTEN. The market is firm and fairly active with demand from domestic and foreign sources strong. Prices are unchanged at \$23 to \$26 per unit for 60% concentrate. Fair sales are reported. Ferro-tungsten is quoted at \$3.30 to \$2.60 per lb. of contained tungsten with demand continuing good.

MOLYBDENUM AND ANTIMONY. Conditions and quotations are unchanged from those reported last week.

# INDUSTRIAL PROGRESS

Information furnished by manufacturers

## Rotary Mine-Car Dump

The Link-Belt Co. has published a bulletin dealing with the Link-Belt mine-car dump, which is now being extensively used in all large mines. It has become a necessity in the

FIG. 1

FIG. 2

FIG. 3

FIG. 4

State of Washington. An exactly similar equipment is employed in connection with the automatic skip loading-hoppers and automatic hoist in the Inspiration copper mine at Miami, Arizona. Details are shown in the other cuts. The power-operated rotary dump is seen in Fig. 1, 2, 3, and 4. Lever B,

moved by the attendant, operates an eccentric-block throwing out the automatic stop, at the same time lowering the rings of the dump upon the constantly rotating trunnions A. Lever B is immediately released by the operator after the car-latch is tripped, and the dump makes a complete revolution, turning the car over, pouring the ore out against a curved chute, and returning to its original position, coming against the automatic stop in such a way that the large rings of the dump are but a fraction of an inch from the rotating trunnions A. The operator then trips the dump and a complete cycle is made without further attention.

The figures show the power-driven single-compartment rotary dump made for a single car, or for cars in tandem. The power is received from the motor, engine, or other means, by shaft A, which rotates continuously. The entering load operates the car-stops as previously described.

## Economy in Oxy-Acetylene Welding

A locomotive on a Central Western railroad was towed into the general shops one day with a badly damaged cylinder. In fact, it was first decided by the shop foreman that the case was hopeless as far as repair was concerned. The road was pressed for rolling-stock and the shop superintendent decided that the damaged cylinder could be welded and the engine kept in service. The oxy-acetylene process was used and the cylinder made as good as new at a trifling expense. A new cylinder would have cost about \$750, while the cost of welding was less than \$20, not taking into the final account the saving of time. The example illustrates the economy now practised among railroads as well as in machine-plants of various kinds, owing to the high price of metal and labor.

A paper company was sadly in need of metal cores, on which the big rolls of paper are wound. Tube-mills were far behind in their orders, and there was a slim chance of getting any action in that direction. Someone thought of the junk heap, where broken and defective cores were piled. Out of a three years' accumulation the company was able to reclaim several carloads of the tubes through the

LINK-BELT ROTARY DUMP, ISSAQUAH & SUPERIOR COAL MINING CO.

economic operation of all properties handling a considerable daily tonnage of ore, coal, or broken stone. It is employed underground as well as on the surface. The accompanying photograph shows the installation as used at a mine in the

State of Washington. An exactly similar equipment is employed in connection with the automatic skip loading-hoppers and automatic hoist in the Inspiration copper mine at Miami, Arizona. Details are shown in the other cuts. The power-operated rotary dump is seen in Fig. 1, 2, 3, and 4. Lever B,

simple process of cutting and oxy-acetylene welding for short lengths into desired lengths.

One Western railway was preparing to tie-up several hundred locomotives because of the shortage in supply of renewal boiler-tubes. Digging into a five years' accumulation of junked boiler-tubes, the company was enabled to salvage and repair, through oxy-acetylene welding, more than enough tubes to put all the dead engines in commission, when rolling-stock was so badly needed, and at an expense that made it well worth while.

High-speed steel is growing so scarce, owing to the enormous demand for it, that many companies are meeting their urgent needs by oxy-acetylene welding short-ends of this material into pieces large enough to be used again in tool making.

Small tools in most plants rapidly run into money and considerable losses are experienced, even in normal times, if breakage is not taken care of. Therefore modern welding processes are coming into daily use in all of the larger shops and many of the small ones, merely to cut down this waste that saps the profits of the year's business.

Efficiency engineers have long contended that the best way to save tools, machines, and material is to reclaim them and use them over again, if it can be done at a profit. Of course, if shops were still dependent on the old forge idea for welding, this salvaging would be out of the question, but modern engineering has shown the way out and is rapidly promoting the use of the electric and oxy-acetylene welding processes.

In one plant, stub-ends of nickel anodes, used in electroplating, were sold as scrap at a low price to get rid of them, until it was found feasible to weld them together and thus use up every bit of the material at an enormous saving. It was like sticking a small piece of soap, left from the old bar, onto a new cake and getting 100% use of the article.

### Diamond-Drilling

The Sullivan Machinery Co.'s recent catalogue states that when the accuracy and dependability of the diamond-core drilling process are duly considered, it will be seen that, on a cost basis alone, no other method of prospecting compares with it; to say nothing of the time saved in securing the desired results.

While churn-drilling is cheaper, it is resorted to for mineral prospecting by experienced engineers only as a substitute for diamond-drill work, in placer ground or in caving or broken formations in which a satisfactory core record cannot be obtained. The sludge or mud samples secured by churn-drills frequently lead to erroneous conclusions as to the mineral contents of the ground under test. As compared with shaft-sinking or tunnel-driving, diamond-drilling is, on the other hand, exceedingly economical; and this actual development work is the only prospecting process with which diamond-core drilling can be compared properly on a basis of results accomplished and information secured. Ten or fifteen diamond-drill holes can be bored at the cost of a single shaft, tunnel, or cross-cut of equal range, and the time required for core-drilling is very much less than that needed for ordinary exploratory or development work.

Figures have been printed from time to time, giving the detailed cost of diamond-drilling work completely under varying conditions; performance records as to speed and cost in hard mineral prospecting, in coal borings, and in engineer's test work, are available to those who wish to study this matter of cost more closely. There are on the market core-drills of other types that cost somewhat less as an initial investment than the diamond-drill and its equipment. On account of its greater rapidity, the fact that holes may be bored at any desired angle, the greater completeness of its core records, and the lower cost of labor and supplies, the actual cost per foot

of drilling is usually found to be less with the diamond-drill than with competing core-drills of other types. The fact of the matter is that core-drills which do not employ diamonds cannot make satisfactory progress at all in the harder formations; and in the softer formations such as are encountered in quarry and coal-drilling, the wear on the diamonds in the diamond-drill is negligible and the rate of drilling higher than with other core-drills. Records kept for a series of years by the Department of Mines of Nova Scotia, which owns and leases both types of machine, have demonstrated the above point very definitely.

Mineral prospecting and engineers' test boring by contract, at an agreed price per foot, have been for many years a specialty by the Sullivan Machinery Co. Contracts are undertaken in any part of this country for any materials. In work of this class, a complete outfit is furnished, consisting of the drill with carbon and all fittings necessary for operation. Skilled operators are supplied who have had experience in the formation to be penetrated. By maintaining a number of outfits in commission at all times, a corps of trained operators has been established, and outfits and men are at all times in readiness to undertake work.

In coal prospecting on a contract basis, the company's experience extends over a period of thirty-five years. By means of improved drilling mechanism, special core barrels, and other devices, the Sullivan drills are able to secure practically the entire coal core, thus furnishing the owner of the property with an exact and reliable record of the thickness and value of the coal vein. The contract work of the company since 1884 has amounted to hundreds of miles of core-drilling, both in this country and abroad.

### Commercial Paragraphs

The new electric hoist of the Elm Orlu Mining Co. at Butte is described in detail in the September 'General Electric Review.'

The Molybdenum Products Corporation of Denver, Colorado, has purchased two No. 64½ MARCY BALL MILLS to be installed in its new mill at Climax, Colorado. The Louisiana Colorado Mining Co. of Denver, has purchased a No. 64½ Marcy mill to be installed in its new mill at Alma, Colorado.

The WALTER A. ZELNICKER SUPPLY CO., St. Louis, has just secured the services of J. C. Bryan, formerly with Manning, Maxwell & Moore, Inc., as South-Western representative of the Ashcroft Manufacturing Co., the Consolidated Safety Valve Co., the Hayden & Derby Mfg. Co., and the Hancock Inspirator Co. Mr. Bryan will be associated with the Equipment Department of the Zelnicker company.

BULLETIN No. 222, just issued by the Walter A. Zelnicker Supply Co. of St. Louis, is entitled the 'Blue Streak Special.' It lists a large amount of equipment ready for immediate delivery, including locomotive cranes; hoists of various types and sizes; air-compressors; pipe; automatic, horizontal, and Corliss engines; boilers; A. C. and D. C. generators; concrete mixers; machine-shop tools; and saw-mills.

The installation of fire-fighting equipment due to greatly increased fire risks is one of the questions to which many mills are giving attention. Chemical apparatus is far superior to water in fire-fighting efficiency. A 50-gallon chemical solution is equal to 4000 gallons of water, and this is a factor to be taken into consideration when fire-fighting apparatus is considered. The Ajax Fire Engine Works, 311 California street, San Francisco, offers several types of compact movable chemical apparatus. These range from the simple wheel-mounted kind to that used in connection with an automobile chassis

	Page
NOTES .....	411

CHUQUICAMATA .....	412
--------------------	-----

An outline of the metallurgical methods adopted for the treatment of the brochantite ore of this great copper deposit in Chile. The use of magnetite and duriron for anodes. The scheme of crushing. Estimates of ore in reserve. The men responsible for the success of this remarkable enterprise. *M. & S. P., September 22, 1917.*

OUR OIL-SUPPLY .....	413
----------------------	-----

The report of the Committee on Petroleum. A remarkably comprehensive and accurate statement. Dwindling production in face of increasing consumption. The remedy. Suggestions. *M. & S. P., September 22, 1917.*

ANOTHER MEXICAN CRISIS .....	414
------------------------------	-----

An analysis of the present condition of affairs, with special reference to the negotiations now pending for an American loan to the Mexican government. Finances of Mexico. The railway bonds and other indebtedness. Flirtation with Germany. Carranza's industrial conditions. Mining activities. *M. & S. P., September 22, 1917.*

### ARTICLES

MIAMI: THE MINING OF THE ORE—II.	
----------------------------------	--

By T. A. RICKARD.....	417
-----------------------	-----

A detailed technical description of the methods of mining in vogue at the Miami and Inspiration mines from notes gathered during a recent visit by the author. Top-slicing, shrinkage-stopping, and under-cutting methods. Relative costs. Timbering. Ventilation. Plans and sections, with detailed sketches. *M. & S. P., September 22, 1917.*

METHOD OF FILING DRAWINGS	
---------------------------	--

By ALBERT G. WOLF .....	426
-------------------------	-----

Description of a convenient scheme for filing drawings in an engineering office. *M. & S. P., September 22, 1917.*

### ZINC-DUST AS A PRECIPITANT IN CYANIDATION

By W. J. SHARWOOD.....	428
------------------------	-----

Scholarly account of an interesting part of the cyanide process. De-oxidation of pregnant solution, avoidance of a low temperature, control of alkalinity and free cyanide, the use of zinc in a fine state of subdivision, thorough contact between precipitant and solution. *M. & S. P., September 22, 1917.*

### ZINC-BURNING

By W. R. INGALLS .....	432
------------------------	-----

Abstract of paper contributed to the A. I. M. E. The Wetherill grate-furnace and reverberatory practice. Slagging of the zinc. Comparison between types of furnace. *M. & S. P., September 22, 1917.*

### REPORT OF COMMITTEE ON PETROLEUM.....

A cordial appreciation of the report on the oil resources of California, and the use of them, by a committee appointed by the Governor. A prompt investigation and a comprehensive report. How to save oil, an embargo on export, encouragement in substitution of electric energy, and other remedies. *M. & S. P., September 22, 1917.*

### UPFLOW CLARIFICATION OF SOLUTION.

By A. W. ALLEN.....	436
---------------------	-----

An ingenious suggestion by an experienced metallurgist. *M. & S. P., September 22, 1917.*

Established May 24, 1860, as The Scientific Press; name changed October 20 of the same year to Mining and Scientific Press.

Entered at the San Francisco post-office as second-class matter. Cable address: Pertusola.

Branch Offices—Chicago, 600 Fisher Bldg.; New York, 1760 Woolworth Bldg.; London, 724 Salisbury House, E.C.

Price, 15 cents per copy. Annual subscription, payable in advance: United States and Mexico, \$4; Canada, \$5; other countries in postal union, 25s. or \$6.

Transporting Union Drill over 40 Mile Trail

## These Field Pictures Tell The Story

**The Union Prospecting Drill**  
is incomparably light and can be transported, handled and operated with an ease heretofore unknown for a drill having its capacity.

The Type B Drill shown in the bottom illustration weighs 2150 lb. Drills of this type are drilling 60 ft. ground and deeper, at the rate of 20 to 25 ft. a day, using 5-in. casing, which cuts a 6 $\frac{3}{8}$  in. diameter hole. The engine burns  $\frac{9}{10}$  of a gal. of gasoline per hour.

Every Drill guaranteed.

Bulletin, giving complete description, on request

# EDITORIAL

**D**OLLAR silver is no longer a dream. Shades of 1893! The whirligig of time brings strange revenges. We shake hands with old friends in Colorado and Nevada.

**G**UESSES concerning the price to be fixed by the Government for copper range all the way from 20 to 25 cents per pound. We shall be curious to learn what the Government experts have ascertained to be the average cost of production.

**H**OW the War has stimulated our foreign trade in base metals is indicated by the fact that exports of zinc for the fiscal year ended on June 30 amounted to 504,294,665 pounds, as against only 4,560,000 pounds during the fiscal period that ended just before the War began. Copper exports for the twelve months just closed were 1,021,501,398 pounds, which compares with 711,342,146 pounds in 1916. By the way, is it not time to talk in units of tons, not pounds?

**I**T is our pleasure to reproduce an article contributed to the Institute by W. J. Sharwood. Keen observation and wide experience in cyanidation give special value to his writings. Zinc-dust precipitation is his subject this time. The de-oxidation of pregnant solutions, the avoidance of a low temperature, the control of alkalinity and free cyanide, the use of the zinc in as fine a state of subdivision as possible, and the thorough contact between solution and precipitant are some of the points on which he lays stress. While recognizing the accuracy of knowledge possessed by this metallurgist, may not a hard-worked editor express appreciation of the accuracy of Mr. Sharwood's writing. It is a rare pleasure to be able to publish an article that needs no revision, only half a dozen hyphens and the deletion of a couple of verys. A scientific observer that writes so accurately is one whose research commands confidence.

**O**BJECTION has been taken to a paragraph appearing in our issue of September 8 concerning the incidence of the flotation royalty on the ore treated in the mill of the Britannia Mining & Smelting Company. The clause in the contract with Minerals Separation specified the royalty as payable on "crude ore milled." It was claimed by Mr. E. H. Nutter, representing Minerals Sep-

aration, that this included all ore entering the mill, whereas Mr. J. W. D. Moodie, manager for the Britannia company, held that it applied only to the feed going to the flotation machines. Mr. Nutter waived any claim on the ore removed on the picking-belt for direct shipment to the smelter, but insisted that it applied to all the ore fed to the rolls after the shipping ore and the waste had been sorted out. We were incorrectly informed when stating that this sorted ore was made liable for royalty. In consequence of the difference of opinion between Mr. Nutter and Mr. Moodie, the clause was subsequently amended so as to make the royalty payable no longer per unit of copper, but per ton of ore, tailing, or slime treated by use of any of the patents owned by Minerals Separation.

**P**LEDGES to save food and thereby to support Mr. Hoover's patriotic effort have been sent to us at a gratifying rate. We give the pledge this week on page 38 of the advertising supplement. If you are willing to economize in order to aid the national cause, sign the pledge and mail it to us; we will forward it to Mr. Hoover at Washington. To those that have signed it we venture to say that you are on your honor to fulfil your promise. It is not much we stay-at-homes are doing. Surely we can forego a little butter, a little white bread, and a little beef for the sake of the cause to which our young men have dedicated their lives. The present writer is not of those that think "Food will win the War," as a foolish heading in our local evening paper stated recently. Not by talk, nor by subscribing to the Red Cross, nor even by Hooverizing, shall we win the decision by which the world is to be made free from Prussian outrage, from "brutality organized to a system," from "cruelty reduced to a science." The victory over "the beast with the brains of an engineer" will be won by brave and intelligent men completely equipped with the scientific implements of war; the men that go forward under the folds of the flag to save American soil from the devastation that has blackened France and the piracy that has violated Belgium—they are the ones that count. Yet we can do something, and the best that we can do is the least that we should do. We can supply the money and the food, by paying taxes cheerfully, by buying the national bonds, and by econ-

omizing in food. This last everybody can do in his and her way, saving for the sake both of our soldiers and of the hungry peoples in Europe victimized by invasion. Therefore eat the perishable food-stuffs produced locally and release as much as you can of the food-stuffs that can be transported to distant points—to the trenches and to the broken hearths across the water. Sign the Hoover pledge and live up to it conscientiously.

THREE mining engineers have reached the grade of Lieutenant-Colonel during the War, and we are proud of them: Rowland C. Feilding, Peter N. Nissen, and Ralph Stokes. Colonel Feilding was captain in a yeomanry regiment when hostilities commenced, so that he was already started on the road to promotion. He has won the D. S. O., or Distinguished Service Order, which is only given for acts of especial courage, intelligence, and military value. Colonel Nissen likewise is a D. S. O. He volunteered at the close of 1914 and soon made a name for himself by inventing the Nissen hut, a half-cylinder of corrugated iron. The stamp and the hut have established his honorable fame. Colonel Stokes has won the Military Cross on the battlefield; he enlisted in the Royal Engineers in the very first days of the War, crossing from New York to London in early August of 1914. He went to the front a corporal, but soon won a commission. As Controllor of Mines he directs the big sapping and undermining operations, such as those that enabled the Messines ridge to be captured. While referring to such good men and true it is a pleasure to mention Mr. Kenneth A. Mickle, an Australian metallurgist whose name we have quoted more than once in connection with flotation research. He is Captain in the Artillery and also a D. S. O. These men have greatly honored our profession.

WE note with interest that the 'Boston News Bureau' has been obtaining information concerning the flotation litigation from Mr. Henry D. Williams, chief counsel for Minerals Separation. In our last issue we quoted an interview with that distinguished attorney. In a later issue of the 'News Bureau' we find Mr. Williams laying stress on the iniquity of the supposed infringers and stating that "there is no escape from their liability for the past even should they now discontinue the highly profitable use of flotation." They won't. Flotation includes processes not covered even by the numerous patents of Minerals Separation. Mr. Williams quotes Judge Bourquin's explanation of the Supreme Court's decision as if the Judge at Butte were the court of final resort. The Montana decision will be reviewed by the Appellate Court in San Francisco. This is a most intelligent court and already versed in flotation technology. In another issue the 'News Bureau' quotes the terms of the Anaconda-Inspiration contract with Minerals Separation and estimates that both pay the minimum royalty of 4 cents per ton, which, in the case of the Inspiration, would amount to about \$212,000 per

annum. The Jackling 'porphyries' are mentioned as "vigorous contestants" of the Minerals Separation claims and are credited with producing 22,000,000 tons of ore per annum. Supposing—anybody may suppose—that an arbitrary royalty of 8 cents is charged against the copper companies and 12 cents against the Butte & Superior, then the five Jackling companies would have to pay \$1,782,753 per annum—so says the 'News Bureau,' disclaiming any "official basis" for assuming any of the royalties instanced, and suggesting that this \$1,782,753 is "by no means a burdensome total." It may or may not be "burdensome," but \$1,782,753 will pay for a good deal of litigation and might be incurred cheerfully to avoid the embargoes and impositions that unfortunately are tied to a Minerals Separation license. Moreover there is a glimpse of ebony in this wood-pile, for the 'News Bureau' says: "Of course, the above figures are outside of any adjustment yet to be made on account of damage claims." As to the kind of damages that Minerals Separation expects, it is noteworthy that this same source of gossip, the 'News Bureau,' refers, in a third issue, to the American Zinc, Lead & Smelting Company, which is said to be liable for damages. The directors of this company are undecided, says the 'Bureau,' "whether to attempt a cash settlement, which could be had, we are told, for not over \$500,000, or to persist along with the Jackling porphyries in the litigation." It looks as if the 'Bureau' had been informed concerning that succulent \$500,000 by Mr. Williams, for in the next paragraph counsel for Minerals Separation is quoted as saying that suit has not as yet been brought against the American Zinc company and if the company has "not given material assistance to the companies which have contested the validity of the Minerals Separation patents," then this company will be allowed graciously to buy a license and settle for its past infringement. There is nothing mean about these M. S. people, they will allow you to pay them liberally and in return they will permit you to discover for yourself how to treat your ore.

## Chuquicamata

It is a pity that such a pleasant mouthful of a name should have been set aside by Mr. Daniel Guggenheim when he formed the Chile Copper Company to exploit this remarkable deposit of ore. The Chuquicamata has become one of the romances of mining. In 1911 Mr. Claude Vautin brought the project to Mr. A. C. Burrage, who in turn interested the Guggenheims. In 1912 these enterprising gentlemen organized a development company to undertake systematic drilling and other exploratory work, which proved so successful that on April 16, 1913, a \$95,000,000 corporation was formed to absorb the \$20,000,000 development company. Immediately thereafter the capital of the corporation was increased by the issue of \$15,000,000 worth of 7% convertible bonds, to which the public was invited to subscribe, while

the Guggenheims and their friends retained all the common shares; in short, having demonstrated the value of the property, the promoters allowed the public to complete the development and equipment on an investment basis, while they, the promoters, retained 86% of the capitalization. At that time it was stated that 100,000,000 tons of  $2\frac{1}{2}\%$  copper ore had been developed and twice as much was 'possible.' The deposit had been found to have a length of 12,000 feet, a maximum width of 700 feet, and an extreme depth of 1000 feet. By that time the metallurgical treatment of the ore had been worked out by Mr. E. A. Cappelen-Smith. It is noteworthy, however, that it was Mr. Vautin's recognition of the true mineral character of the ore that indicated the economic value of the deposit. Samples of the ore had been listed in many museums as atacamite, the oxychloride of copper, whereas it really was brochantite, a basic sulphate of copper named after the French mineralogist Brochant de Villiers. These two minerals are much alike, both being emerald-green with a vitreous lustre; and an occasional admixture with chalcantite, or 'blue vitriol,' tended to confirm the confusion. The recognition of the predominant copper mineral as brochantite was of supreme importance because this sulphate is readily soluble in cold dilute sulphuric acid even after only a coarse crushing. That is the basis of the existing metallurgy at Chuquicamata. A combination of leaching and electrolysis was immediately outlined. Two difficulties presented themselves; the chlorine in the salt of the surficial portion of the deposit promised to yield chlorine, which would foul the electrolyte; the other difficulty was to find a suitable anode. A magnetite anode of German manufacture was selected; this broke too easily, but the War prevented further purchases, so that a substitute had to be found. Duriron is now being used satisfactorily, except that a small proportion of iron goes into solution, accumulating sufficiently to spoil the electrolyte, a part of which is rejected in order to maintain favorable conditions. In the starting-plant copper anodes are used with cathodes of sheet-lead, on which 7 to 10 pounds of copper is precipitated in 24 hours. The copper thus deposited is stripped and used as a cathode in the main precipitation-plant in conjunction with the duriron anode. This goes into solution slowly, lasting about seven months; it is a mixture of iron and silicon, and is cast in the company's foundry by aid of an electric furnace. The same material is used in the pumps that move the copper solutions. Acid is made on the spot, but this will be obviated shortly because sufficient acid is made incidentally when dissolving the brochantite. The original estimate was 10 pounds of sulphuric acid per ton of ore treated. Owing to the relative purity of the metallic product from electrolytic precipitation, the smelting plant is small, consisting only of two reverberatory furnaces for melting the cathode copper and removing the impurities by oxidation, the skimmings being treated in a blast-furnace. To the metallurgist the most striking feature

of the local practice is the crushing, which is not carried beyond  $\frac{3}{8}$  inch, this sufficing for effective leaching. Thus the main expense and difficulty incidental to most milling operations—namely, fine grinding—is escaped. The original scheme was to break the ore at the mine so that all would pass a 14-inch grizzly. This was drawn by a caterpillar feeder to a 4-inch grizzly, the oversize from which went to McCully gyratory crushers and the undersize to secondary crushers, thence to trommels and Garfield rolls, supplemented by Symons disc-crushers, delivering to belt-conveyors. The feeder and conveyors proved a nuisance on account of rapid wear. Now two large jaw-crushers are followed by 8-inch grizzlies, thence to the secondary crushers. It is proposed to substitute three-stage disc-crushers for the rolls and the small gyratory crushers. The leaching plant contains six square concrete vats each of 10,000 tons capacity; they are charged by a system of 48-inch belt-conveyors and discharged by electrically operated clam-shell buckets that load the residue into a hopper-bin for loading in a train of cars. The leaching covers five periods, each of 24 hours, for charging, upward saturation, downward leaching, washing, and discharging. The solution contains  $2\frac{1}{2}$  to 5% sulphuric acid, according to requirements. Many troubles, mechanical and metallurgical, such as are inevitable to so big an undertaking, have been overcome successfully. The staff gives the major credit to Mr. Cappelen Smith. The original appraisalment of the venture is to be credited to Mr. Pope Yeatman and the exploratory development to Mr. Fred Hellmann. Mr. H. C. Bellinger is now in charge. The enterprise has enhanced the reputations of all these men, besides giving the Guggenheims the opportunity for one of the most remarkable financial coups on record. According to a recent estimate the ore proved amounts to 350,000,000 tons averaging 2.23% copper, of which 2% is considered recoverable. The total cost was estimated, on a production of 10,000 tons per day, at \$2.10 per ton, equivalent to  $5\frac{1}{4}$  cents per pound of copper. The ore now being treated averages 1.7% and the total cost is 6.76 cents per pound of copper, this higher figure being due largely to conditions created by the War.

## Our Oil-Supply

The declaration of war against Germany evoked many expressions of patriotic endeavor, some of them of a fussy and feminine kind, more particularly the organization of an untold number of committees upon which all sorts of people have found place. Washington is cluttered with committees. Every State has lots of them, many being mere safety-valves for a vicarious patriotism that accomplishes nothing except to let off steam and thereby obscure the realities of the national crisis. In California we have had our share of this infiction. It becomes all the more agreeable therefore to make note of one committee that has promptly and efficiently performed the particular duty for which it was assigned;

we refer to the Committee on Petroleum appointed by the Governor on May 9 and requested "to obtain the facts relating to the production, distribution, and utilization of petroleum" with a view to making such recommendations as might aid the proper disposition of an important natural resource. This committee consisted of Mr. Max Thelen, who is President of the State Railroad Commission, Mr. Eliot Blackwelder, who is Professor of Geology in the University of Illinois, and Mr. D. M. Folsom, Professor of Mining in Stanford University. So expeditiously did these gentlemen discharge their task that their report was transmitted to the Governor on July 7, barely two months after the date of their appointment. We have read this report of 190 pages, with maps and statistical tables; it is a surprisingly complete and convincing statement. There can be no question concerning the timeliness and trustworthiness of the information. The 'Conclusions and Recommendations' are comprised within 13 pages, which are so much to the point that we regret being unable to quote more than a part of them elsewhere in this issue. One-third of the oil produced in the United States comes from California; but the production of this State is decreasing, while the consumption is increasing, so that the entire available storage of fuel-oil will be exhausted by June 1919. The question is how to stimulate production and to conserve the produce. A dearth of equipment hinders drilling; it is suggested that the Federal government take steps to expedite the making and the delivery of such equipment. Much of the unexhausted oil-land is unavailable for exploitation owing to litigation with the Government, notably the most desirable area, known as Naval Reserve No. 2; but there are considerable tracts of oil-bearing ground that could be opened to exploitation if the Attorney General were to sanction some arrangement whereby the rights of the claimants were protected. One obvious measure of conservation is to place an embargo on all exportation of Californian oil outside the United States, although this is a step so drastic and likely to injure established industry so greatly as not to be taken without careful enquiry. The substitution of coal for oil wherever practicable should be supplemented by more liberality in the distribution of hydro-electric energy for fixed plants. This is a matter within the province of the State Railroad Commission, through its rate-fixing power. As Mr. Thelen is chairman of that commission, a remedy is not far to seek. The report acknowledges the cordial assistance given to the Committee by Mr. E. J. Justice, special assistant to the Attorney General of the United States and in charge of the litigation arising over the withdrawn oil-lands. Mr. Justice has died since this acknowledgment was made; he is succeeded by Mr. Henry F. May, whom we happen to know well. Mr. May is a lawyer of ability and distinction, a graduate of Harvard and a highly respected citizen of Denver; he is a man of rare intellectual honesty and peculiarly fitted to see that right is done in the many legal complexities

that have developed out of President Taft's order. We hope he will be able to expedite a decision in these cases, so that the oil industry may be relieved of an incubus.

## Another Mexican Crisis

Events of the highest importance are transpiring in our relations with Mexico. So far-reaching are the arrangements now being made that it may be affirmed that a new era has begun. The first public announcement of the changed attitude of Carranza's government was given in a dispatch from Washington on September 12. It stated that the last steps in the formal recognition of Carranza as president of the Mexican Republic had been taken by the United States. Although the authority of Carranza as *de facto* head of Mexico was recognized many months ago, followed by accrediting an ambassador to represent us before the provisional government at Mexico City, the status of our international relations was not permanent. It was still uncertain whether the Mexican Government would assume a friendly attitude toward us in our conduct of the War. The German influence south of the Rio Grande was a serious menace, and the circular letter from Carranza to the other Latin-American countries proposing an embargo upon commerce under the plea of perfect neutrality was logically construed as indicating a hostile feeling toward us in our struggle with the Central Powers. It was inevitable, however, that Mexico could not long maintain economic independence of the United States unless Germany should promptly achieve a decisive victory. At that time the ruthless submarine campaign had just begun, and it is easy to understand that the representations of German agents may have made the possibility of success by their country against the Allies seem plausible. To take the most generous view possible of the evident animosity of Mexico at that time, it is conceivable that Carranza, seeking to play safely so as to be *persona grata* to the winning side, should choose an enigmatic position. As the War went on, and the submarines failed to cut off American supplies from France and England, the needs of Mexico required a change of policy. This became manifest chiefly through the persistent efforts of Carranza to obtain a substantial loan from this country. The dispatch from Washington on September 12, previously referred to, definitely declared that no loan would be made by the United States, but that the question of "a loan still is under consideration between the Mexican Government and a group of American bankers." The fact that important negotiations are in progress is revealed between the lines of this semi-official announcement. From sources close to the governments of both countries it may be accepted as practically certain that not only has the United States obtained guarantees that admit of an endorsement of such a loan, but that a tripartite agreement has been reached in regard to it between this country, England, and France. It is understood, furthermore, that the diplomatic engagements

entered into have settled many difficult questions concerning claims for indemnity that these powers have preferred against Mexico. It will thus serve to smooth a wide expanse of troubled water, and to remove possibilities of international friction that have been freely discussed, arising from an assumed responsibility on the part of this country on account of its insistence that European powers should not intervene in Mexico for the protection of their nationals. Apparently the administration at Washington has discovered in the demands of Mexico for a loan some brilliant opportunities for promoting cordial relations between a great group of interested nations. It was definitely stated by parties in touch with the negotiations now pending that the loan would be made before the Mexican Independence Day on September 16. That would have enabled Carranza to utilize his success in a spectacular manner at a psychological moment for creating a new spirit of popular friendship for America. Evidently there has been a postponement. But a loan appears assured. When it is arranged his own personal pride in this achievement will naturally be shared by the Mexicans themselves, so that it will go far toward producing an era of good feeling advantageous to them and also to our mining and commercial activities in that country. The amount of the loan is said to be \$250,000,000 United States currency. Of that amount \$150,000,000 is to be available for the Government in covering its deficit, which has been accumulating since last spring at the rate of nearly \$5,000,000 per month. It will also enable the Mexican government to pay interest on its bonds, now in default, and to pay its soldiers, without which Carranza could not count upon a loyal army to maintain his authority. The remaining \$100,000,000 is to be used for rehabilitating the National Railways. The deplorable conditions of these roads is shown by the fact that practically no freight is moving under Government administration on the National lines. Indeed, there is scarcely any rolling-stock remaining that is in condition for service. The American Smelting & Refining Co. is handling its freight over the Mexican railways by means of its own equipment, having in operation 20 locomotives and 400 freight-cars. The subsidiary companies of the American Metal Co., known in Mexico as the 'M. & M.' (La Compañía de Metales y Metales, S. A.) is doing the same thing, as is the well-known house of Danti Cusi in Mexico City, and other lesser operators. The arrangement under which this traffic is maintained constitutes an example of hard bargaining that is extraordinary. The individual operators provide their own staff and crews, working in cooperation with the staff and crews of the National Railways, and they pay full freight-rates to the Government despite the fact that the goods are hauled in cars drawn by locomotives that all belong to the shipper. A natural result of this anomalous condition is to force shippers from small mines into the position of beneficiaries of the great smelting companies, through whose favor alone can they hope to market their ores. Since the smelters are

primarily interested in moving the output of their own mines, the independent producer is willing to pay handsomely for the privilege of shipping his ore. It means extra profits for the smelter, but the difficulties of the small operator are chargeable primarily to the abnormal conditions that follow as the aftermath of a devastating revolution.

Returning to the loan, it is rumored on good authority that the vast sum of \$100,000,000 for improvement of the National Railways is not to be turned over to the Government for disbursement, but that the money and the roads themselves are to be placed for a considerable period in the hands of a committee representing the holders of the National Railways of Mexico bonds, exclusive of the Mexico North-Western Prior Lien 6% bonds. It would seem logical that such a string should be tied to the money that will be advanced by bankers already directly and indirectly interested in the earlier bond-issues, although this restriction is denied by a prominent official of the Carranza government. The National Railroad Prior Lien 4½% bonds, due in 1926, are outstanding to the amount of \$23,000,000. The interest due in January 1914 was paid by three-year 6% notes due January 1, 1917. Interest was defaulted in July 1914. The National Railroad First Consolidated 4% issue, due in 1951, amounts to \$24,740,000 outstanding. The interest due in April 1914 was paid with 6% notes but the interest was defaulted in October 1914. The National Railways of Mexico Prior Lien 4½% bonds, due in 1957, are a first mortgage on 131 miles of road, a second mortgage on 3650 miles, and are a further lien on 2400 additional miles of track, covered by underlying bonds. Interest was defaulted on these bonds in July 1914. The National Railways General Mortgage 4% bonds, due in 1977, are a junior issue guaranteed as to principal and interest by the Mexican government. Interest on these was also defaulted in October 1914. The Mexican Government bonds represent an indebtedness of \$140,830,211, the interest on which is also in default. The only other direct obligations of the Mexican government are \$30,000,000 of 6% notes issued in 1913, and two internal loans. It will be seen that a correct application of the funds now to be placed in the hands of the Mexican government would re-establish Mexico's credit so far as relates to the payment of interest on her obligations, and would suffice for a material rehabilitation of her railway system. It would not, however, sustain the Government through the period that must elapse before the revenue from her reviving industry could balance her current expenses. Therefore it is thought that she will soon apply for an additional loan. It is certain that the Government is anticipating these future needs, and the difficulties that may be experienced in obtaining further accommodation on the heels of her first success in Wall Street, by undertaking to float a 'patriotic loan' in imitation of our Liberty Loan. It is to be nominally a voluntary offering by the people from the poorest laborers to the richest alien corporations. In effect, however, it will be oblig-

atory, at least so far as the owners of the larger enterprises are concerned. Arbitrary schemes to recuperate the national treasury are by no means ended, and it is not to be expected that new investment of foreign capital will be made in Mexico until the country is in a sound financial condition. In its present extremity it must have recourse to excessive taxation, and that involves the necessity of building upon the ruins of the old rather than upon new industrial foundations. Those having property will be compelled to operate in order to save it; Carranza has frankly adopted the principle of use as the basis of valid ownership, and under the leasehold system this principle can be more easily invoked than under the American plan of issuing title to mining property.

The Mexican government has undertaken to rid itself of the burden of its fiat money in a manner that is effective even though it lack something in the quality of strict justice. The uncounted millions of currency reeled off from the presses during the heat of the revolutionary struggle were treated as a mere expedient entailing no obligation after having served its immediate purpose, but the later issues of Constitutionalist currency, engraved and printed by the American Bank Note Co., are recognized as representing at least some claim for redemption. Because these cannot be easily counterfeited they are called 'infalsificables', and it is chiefly because of this that the Government does not undertake to wholly repudiate them. Accordingly they are being retired, but in a unique manner. Specie payment is now obligatory in the Republic, and even the 'infalsificables' are not legal tender, but the Government has created a market for them by requiring that all duties, taxes, and imposts of every nature that are payable in coin, must be accompanied by an equal amount, in face-value, of this currency. It means nominally the payment of double taxes, but in reality the 'infalsificables' sell at the rate of about \$8 U. S. currency for every ₱1000. Over ₱500,000,000 of this currency was originally issued, and the amount still outstanding is unknown. Thus the burden of revolutionary finance is being quickly and comfortably thrown aside, leaving the future untrammelled. With silver selling at 98½c. per ounce the Mexican dollar is quoted at 80c., and two Mexican silver half-dollars are worth 65 cents. Meanwhile the gold peso has an exchange value of 54 cents. The coining of silver in Mexico is proceeding rapidly and the Government is purchasing the output of many of the larger silver mines, especially from those in the Pachuca district. Until recently American coins, both gold and silver, were received in Mexico at a discount of 7½%. This made them desirable from a speculative standpoint, since they could be melted and the metal sold at a profit. The order by President Wilson on September 7, prohibiting the exportation of United States coin, will put an end to this practice.

It is generally conceded that Carranza is now seriously endeavoring to re-establish law and order, and to develop industry. The personal independence of the governors of the various States that threatened the future

of the country until recently has been curtailed, in many cases by the voluntary co-operation of the local autocrats. This is another favorable indication of a return to stable government. The only States nominally Constitutionalist that persist in arbitrary local self-government are Yucatan and Oaxaca. Zapata still holds the greater part of Morelos and Guerrero, including the ports at the mouth of the river Brazos. A portion of Michoacan is also dominated by the Zapatistas. Villa remains in the field near Parral, and frequently interrupts service on the Central Railroad between Chihuahua and Torreon. The German propaganda is apparently waning in Mexico, although the sentiment of the people still inclines toward the Teuton. It is thought that public sympathies will be given a twist in favor of America and the Allies when the announcement of the loan is officially made. The activities of the American Metal Co., through its Mexican subsidiaries, have been credited with significance in connection with the pro-German movement, although the enormous investments made by this company will ultimately yield profitable results, no matter what turn affairs might take. It has purchased mines in all parts of the Republic, and is doing a huge business, including the operation of the coal mines of Agujita in Coahuila, the old Madero smelter at Torreon, the Saltillo smelter, and the recently constructed smelter at Monterrey. Up to the present time very little ore is coming to the United States from any sources in Mexico. The principal shipper is the Potosi Mining Co., operating in the Santa Eulalia district near Chihuahua. It is sending an average of 250 tons of lead ore daily to the El Paso smelter. This concern is a subsidiary of the company that owns the Britannia mine in British Columbia. The local manager is Mr. E. S. Plumb, and the financial agents are Moore & Schley of New York. It has operated without intermission throughout the revolution, a distinction that few mines in Mexico can claim. The American Smelting & Refining Co. is operating its smelters at Monterrey, Matehuala, and Aguas Calientes, and is working mines at Reforma, Monclova, the Bonanza in the Mazapil district, Matehuala, San Luis Potosi, Tepazala, Aguas Calientes, and Angangueo. It is complying with the 8-hour law, but not with the 7-hour law for night work. The workmen are generally dissatisfied, having had their expectations of an I. W. W. Utopia aroused by the new constitution. The strike at Monterrey has been settled, but the men are arrogant and difficult to control. Government officials are said to be reasonable, and to display a spirit of helpfulness in maintaining order and in quelling the rebellious tendencies of the laborers. In Sonora Governor Calles has openly declared that he will stand between the mining companies and the Constitution, but the labor problem is fraught with grave difficulties, and the problem before the Government in restoring favorable conditions for operating industries is most serious. There are many storms to be weathered before the new industrial era in Mexico can be fully established, but the outlook is improving.

FIG. 1. SURFICIAL RESULTS OF THE SLICING SYSTEM OF MINING

## Miami: The Mining of the Ore—II

By T. A. RICKARD

**PROSPECTING.** When once the existence of the ore-bodies had been demonstrated by shaft-sinking it became economical and expeditious to ascertain the size and copper content of them by drilling. For this purpose the churn-drill proved most serviceable. The holes were drilled without any casing until the caving of the sides of a bore prevented progress, usually soon after ground-water was reached. The casing was then inserted and drilling resumed with the next smaller set of tools. At the start the hole was given a diameter of 10 inches and it was usually finished with a 6-inch tool, although in some instances it became necessary to employ a 4½-inch tool to reach the required depth.

**METHODS OF MINING.** Three systems of mining are in use at Miami; all have points in common, but, for the sake of differentiation, they may be designated

- (1) Top-slicing,
- (2) Shrinkage-stoping, with caving of pillars,
- (3) Under-cutting, with caving of the orebody as a whole.

The first two methods are exemplified by the Miami mine, and the third has been adopted in the Inspiration mine. The size and the position of the orebodies relative to the surface are as follows:

	Miami		Inspiration
	Captain orebody	Main orebody	Joe Bush orebody
Depth of top of ore, ft. . . . .	130	380	115
Depth of bottom of ore, ft. .	530	1,000	385
Maximum area of ore, sq. ft.	213,700	770,000	544,500

From the Tinkerville ridge, 200 yards west of the Miami No. 4 shaft, one can see how the surface has settled above the slicing-stopes in the Miami mine. These stopes cover an area extending 325 ft. south, 425 ft. north, 625

ft. east, and 25 ft. west of the old Red Rock (or No. 2) shaft, which penetrated the first big orebody. The ore has been excavated or 'sliced' for a maximum thickness of 200 ft., between the 220 and 420-ft. levels. The consequence is a steady subsidence of the overlying surface, the sinking amounting to 70 ft. The area of subsidence—its edges particularly—is marked by large cracks, as is shown in the accompanying photograph (Fig. 1). The big crack to the right does not extend to the main shaft, as might appear; it turns sharply to the left. The hill on which the little houses stand is solid ground. Just beyond or westward of the Red Rock shaft—now identified by the ruined water-tank—a hole made by 'piping' breaks through the cap-rock from a shrinkage-stope below. Such piping, or running of ground from the surface into the mine, never happens when employing top-slicing. The 'pipe' mentioned is connected with the old shrinkage-stopes in the south-west orebody that were completed some time ago and will not be considered in this article.

From the dump of the old Captain (or No. 1) shaft one can see the surficial results of shrinkage-stoping plus caving at the west end of the Miami mine in the Captain orebody, and of the under-cutting plus caving system at the east end of the Inspiration mine in the Joe Bush orebody. The two properties are contiguous, as shown by the map in my previous article. From the boundary looking eastward, so as to face the Miami end, the observer notes (as seen in the second photograph, Fig. 2) that the cracking and slipping of the ground on the Captain claim is at right angles to the strike of the orebody; the removal of ore underground has produced a step-like subsidence without disintegrating the surface, which is settling gently. This is due to good control of

the ore while it is being withdrawn through the raises and the establishment of a horizontal movement, as will be explained later. Looking the other way, toward the Inspiration, one notes how the step-like slips cease abruptly at the boundary, from which westward there extends a V-shaped pit, about 75 ft. deep, having its longer axis along the strike of the orebody, as is shown in another photograph, Fig. 3. This is the hole made by the caving of the surface above the Inspiration stopes; and it serves to distinguish, superficially, the method of excavation in use in that mine. The method is adapted to the conditions, as we shall see; and that is the best that can be said of any method. The 'cap', or overburden of leached and impoverished rock, is disappearing into the open pit and mingling with the sulphide ore of the deeper ground, diminishing its richness but permitting it to be mined extremely cheaply. A steady widening of the pit follows the drawing of the overburden.

Looking farther westward, another pit is detected; this marks the top of the caving ground on the Copper Wonder claim, a part of the Inspiration property. The hills are becoming scarred, but, at their worst, they do not suggest the big holes being made underground. On the south slope of the Inspiration's big pit, I was shown the frame of the testing-plant in which the original wet-milling experiments were made and the first 15-ton flotation plant tried. But that is another story.

**SLICING.** This method of mining is applied to the Miami main orebody, which is mostly in schist. The contact of this schist with the overlying conglomerate follows the line of a fault, the vertical throw of which has not been determined, but it is at least 2000 ft. A dike of granite runs through the orebody but it is mineralized just like the schist, and as richly. This tongue of granite connects with the massive intrusion constituting the matrix of the Captain orebody.

Stoping is in progress from 380 ft. below the surface to the 570-ft. level. On that level the orebody, which is in schist, is 700 ft. wide from east to west and 1100 ft. long from north to south, and averages 2.4% copper. The first thing to do was to reduce the orebody to a horizontal plane and then form a mat to serve as the cover to the subsequent slicing. Therefore the work began with placing square sets across the full width of the ore at a shallow level, followed by stopes that were protected by stulls at the back. Thus, in starting the slicing system, the first step is to remove the peaks and irregularities by ordinary square-set stoping, reducing the top of the orebody to a floor large enough to serve as a unit. See Fig. 4. The square sets are blasted as soon as the ore has been removed, so that the timber may form part of the 'mat', which is the cover of shattered timber that serves as a roof above the horizontal stope, or 'slice', in which men are at work.\* See Fig. 5. The next step is to stope a depth of 10 ft. under the upper floor, which is sup-

ported by round posts and caps, the mat acting as an overhead lagging and also as a bridge or roof between the broken cap and the next slice, a stope 10 ft. high over an area 250 ft. square. The broken 'cap' follows each successive slice as the excavation is progressively extended downward. Access for men, timber, and supplies is obtained through a central two-compartment raise. From this 'supply-raise' four drifts at right angles are run to the extreme limits of the 250-ft. block. These drifts are as high as the slice is deep—namely, 10 ft. Then stoping is started at the extreme corners of the block, the excavation retreating as rapidly as possible toward the central raise, so that the drifts may be kept open for the passage of men and material until the moment when all the ore has been removed. See Fig. 6. The ground settles as the ore is under-cut. No attempt is made to keep open a stope any larger than 50 ft. square; as soon as such a stope has been made it is the practice to blast the timbers in order to cause a subsidence of the mat and broken overburden, and promote a complete settlement of the ground to the slicing-floor before another stope is opened adjacent to the preceding excavation. If a stope is extended beyond the 50-ft. limit it will be necessary, in order to prevent dangerous caving of the back, to build numerous bulkheads. To avoid both the danger and the expense, it is found advisable to cave the stope, start another 25 ft. away, and then advance toward the former. See Fig. 6 again.

When about to blast the timbers, the foreman marks (with chalk) those that are giving the largest measure of support and that therefore when shattered will liberate the most weight. Into each post marked by the foreman a 1½-inch hole is bored by a power-auger; this is loaded with a 1½-inch stick of dynamite, primed with an electric-blasting cap, connecting either with a blasting-battery or the lighting-circuit. It is customary to 'shoot' 100 posts in an area of 2500 sq. ft., or about two posts out of three, on the average. This proportion, however, varies widely according to local conditions. The blasted timber falls with the unblasted into the mat and serves in turn to form a roof for the next slice underfoot.

In the early stages of slicing no effort is made to recover timber because it is necessary to accumulate enough to form a thick mat, but once the mat has reached a sufficient thickness, about four feet, varying however with the physical character of the cap, it becomes advisable to recover a portion of the timber. The small pieces of wood, broken by the movement of the ground, pass with the ore to the crusher at the surface, where they are thrown to one side for the use of the employees, who are glad to have them for domestic fuel.

When a raise is choked, so that the ore hangs, it is customary to blast by means of a dynamite cartridge or two—sometimes five or six—tied with string to a stick 1 by 2 inches in section and 10 ft. long, as shown in Fig. 7. Strong cord, cut to length, is provided for this purpose. If this were not done, the men would use fuse as a binder. The cartridge, of course, has fuse attached to

\*Mr. MacLennan showed me a piece of 2-inch plank that had been in the 'mat' for 10 months; it had become compressed to less than half its original thickness.

FIG. 2. SUBSIDENCE OF GROUND ABOVE SHRINKAGE-STOPES

FIG. 3. OPEN PIT ALONG STRIKE OF OREBODY FORMED ABOVE CAVING UNDERGROUND

it. The fuse is 'spit' before the stick is shoved into the raise.

The maximum length of wheelbarrow work is 25 ft., the chutes being 50 ft. apart. Ore that is not more than 10 ft. from a chute is shoveled into it, the distance of shoveling varying according to the strength, reach, and willingness of the man doing the work.

**SHRINKAGE.** This is the system applied to the Captain orebody, which extends vertically 400 ft. and has a horizontal section of 250,000 sq. ft., namely 500 ft. across and 500 ft. along the ore-belt. The Captain shaft was sunk in a small body of schist entirely surrounded by granite; at 170 ft. this shaft passed into the granite, being continued to a depth of 205 ft., where it was stopped. Subsequently the shaft was re-opened and sunk to 500 ft. in order to serve the orebody found by churn-drilling from the surface. The Captain claim covered 4,000,000 tons of ore. No wonder that the engineer at this shaft comes to his work in a motor-car. I saw it standing, exposed to the Arizona sunshine, beside the shaft-house.

The shrinkage system consists essentially of a series of narrow vertical stopes and partitions; part of the ore being removed, and the remainder settling, while mining operations retreat horizontally, instead of vertically downward as in the 'slicing' system. Stopping is started at a depth determined mainly by the shape of the bottom of the orebody, but also by a consideration of the tonnage to be extracted from that orebody. In ground of the character of the Captain orebody there is no known limit to the depth of subsidence. From this base-level the narrow stopes (10 to 20 ft. wide by 500 ft. long, spaced at 25-ft. centres, thus leaving partitions between them of from 15 to 5 ft. thick) are extended upward until the ore overhead begins to cave. Work in the Captain orebody began on the 270-ft. level, the top of the ore being at 70 ft. below grass-roots, so that 200 ft. of backs had to be removed. About 20% of ore is stoped in order to induce the remainder to break away; in other words, five tons is mined by nature for every ton that is mined by man.

Stopping on the 270-ft. level began at right angles to a series of parallel drifts 25 ft. apart, centre to centre, at the western or Inspiration end of the orebody. This stopping was extended eastward in the form of a succession of stopes 25 ft. apart—narrow rooms, about 12 ft. wide, 500 ft. long, and about 100 ft. high. See Fig. 8. In order to allow for the extra space taken by broken ore as compared with ore in place, it is necessary to remove 35% of the broken ore in each vertical slice. As soon as this stopping had reached a safe distance, the withdrawal of broken ore began at the innermost or extreme west end, with the object of establishing a plane of contact between broken ore and 'cap' at an angle of 60° west. When this had been done, the withdrawal of ore was continued, retreating eastward in the wake of the former stopping. These operations started the caving in the upper part of the orebody—the part untouched by the miner—such caving being facilitated by the fact that the

first stope, in the extreme west end, was carried up high enough to ensure the settling of the ground from the grass-roots. When this was being done some fence-posts and barbed wire were drawn through the chutes at the 270-ft. level; their presence in the broken ore looked ominous of an undesirable dilution with waste, but the effect was intentional; it indicated that one essential factor had been established; it proved that the ground was caving all the way to surface, creating a void at the western end so as to cause a horizontal movement of the broken ore toward it, thus accomplishing the two purposes essential to the success of the method, namely:

(1) The overturning and breaking of the partitions left between the vertical slices of stoping, thereby ensuring the withdrawal of this remaining unstoped ore.

(2) Checking the formation of 'pipes,' or runs, through the broken ore to the surface, with consequent dropping of cap-waste into the withdrawing-chutes.

Thus dilution of the ore and interference with the withdrawal of the adjacent ore were prevented. The effect of a 'pipe' may be inferred from the fact that although only 6 ft. in diameter it may reach all the way to the surface, 250 ft. above.

The stopes were carried upward for about 100 ft. only, or scarcely half-way through the back. By the time they had reached that far upward an inspection of the ground overhead, by means of sub-levels entering from the side, indicated that the overlying ore would break by subsidence without further mining. The condition of the unworked ground overhead is watched carefully by means of the access given through these sub-levels, which are 100 ft. apart horizontally and about 30 ft. apart vertically. In order to trace the movement of the broken ore during the withdrawing operations, several thousand blocks of wood were marked and introduced into the stopes or they were placed in sub-levels where the stopes had not reached sufficiently high. The blocks were placed at points 50, 100, and 150 ft. above the 'draw-off,' or withdrawal, level. A differently shaped block was used at each of the three levels mentioned and on each block its latitude and departure were inscribed, using a cutting-tool called a 'scribe.' The blocks introduced at 50 ft. upward were 6-inch cubes; those at 100 ft. were 6 by 6 by 8 in.; and those 150 ft. up 8-in. cubes. The blocks came out almost intact; they were not so much bruised as encrusted with finely crushed ore. By knowing the exact position of the chute through which these blocks were subsequently withdrawn the movement of the ore accompanying any block could be traced. By this means it was proved that a horizontal movement of about 20 ft. westward had been established.

The raises are placed at intervals of 6½ ft. on alternate sides along the withdrawal-drifts, which themselves are 25 ft. apart. Thus the raises tap the broken ore at 12½-ft. intervals in every direction, so that each raise serves for a block 12½ ft. square. The chute itself is 32 inches wide.

When the 'cap' starts to run through a chute and the records show that the expected tonnage of ore has been

FIG. 4. PREPARATORY WORK

withdrawn, the opening is blocked and the chute is removed to the opposite side of the drift, in a space left between the sets. Usually it is possible to draw an additional 150 tons of ore before the waste comes down, so that the ultimate distribution of chutes is only  $6\frac{1}{2}$  ft. apart east and west, but  $12\frac{1}{2}$  ft. apart north and south. This multiplicity of chutes may seem excessive to those inexperienced in this kind of mining, but, of course, the object is to withdraw the ore as cleanly and as completely as possible, excluding any waste. In practice it was found that in first starting to withdraw ore the 'cap' might begin to run through a chute before 25% of the estimated tonnage had been drawn, but that was stopped as soon as the horizontal movement of the broken ore was established, as previously explained. A careful record is kept in order to measure the ore withdrawn at any chute and this showed that the cap had come down prematurely and that further ore remained to be drawn through this particular chute. By sealing this chute and by drawing from the surrounding chutes it became practicable to break the walls of the pipe of waste that had been formed through the broken ore and resume the withdrawal of ore after a small tonnage of waste—15 to 20 tons—had been removed. As J. G. Flynn, the efficiency engineer, remarked: "Once in a while we have a chute running red before time." The cap consists of red schist, which affords a contrast with the gray granitic matrix of the orebody. Fig. 9 shows how a pipe of waste spills into chutes, B and C, on either side, blocking the withdrawal of broken ore. It should be clear that in this system of mining, when the withdrawing-period has been reached, there are no raises remaining above the withdrawal-level. Such chutes as A, B, and C in Fig. 9 are simply openings in the back of the level through which the broken ore is drawn. This broken ore lies directly upon the drift-timbering. The horizontal movement, of which mention has been made, prevents the establishment of such a pipe as is shown in Fig. 9 by breaking the continuity of it.

The records shown to me by F. W. MacLennan (McGill '98), the mine-superintendent and assistant-manager of the Miami mine [to whom I am indebted for the details of my description of these mining methods], show that

FIG. 13  
PLAN OF DRAWING-OFF LEVEL, SHOWING WHERE CHUTES HOLE INTO THE STOPES

more ore has been withdrawn from the ground completely stoped than was expected. This gratifying result is due probably to an under-estimate of the original height of the orebody and to an admixture of waste. The assay of the ore drawn compared with the sampling of the orebody shows a decline in grade from 2.05 to 1.90% copper. The smallness of the decrease indicates that the dilution of ore by waste has been relatively slight, and that the operation has been highly effective.

The accompanying diagrammatic plan and sections will serve further to explain this system of mining. See Fig. 10, 11, 12, and 13. The longitudinal section (Fig. 11) was prepared for me by Mr. Maclellan to show the progress of operations to date. It will be noted that the pillar immediately west of W 300 has just been undercut and the pillars east of this point are left intact in order not to throw weight on the withdrawal-drifts until such time as it is necessary to break these pillars for the purpose of extracting what ore they contain. In this way the length of drift in which expensive repairs are necessary is only the base of the triangle between W 400, W 300, and the top of the orebody.

The terms 'chute' and 'raise' must not be used indiscriminatingly. Mr. Maclellan tells me that he and his staff make "a hard and fast distinction" between them. He writes: "The term 'raise' is applied to an upward opening either through solid ground or through broken ground, but in either case it is an opening with well-defined walls which it is our intention to maintain. The term 'chute' we apply to the arrangement at the opening into a drift or other working through which ore may be passed and controlled, whether this opening is at the bottom of one of our transfer-raises from a haulage-level such as is in use in our top-slicing or whether it is the opening directly to the bottom of a mass of broken ore, such as the chutes on our drawing-off level in the Captain orebody. To make this more clear a parallel may be drawn from a water-system. If we imagine a tank set 20 ft. above the ground and from it a pipe at the lower end of which there is a tap, then this pipe may be likened to a 'raise' and the tap to a 'chute' in the top-slicing system, whereas to be comparable with the chutes in the shrinkage system of mining in our Captain orebody, the tap would have to be placed in the bottom of the tank itself." This distinction, of course, is one that should be maintained. By restricting a technical term to a definite use we give it a precise meaning. Many descriptions of work underground are rendered confusing by the reader's inability to ascertain whether a 'chute' is meant to indicate the chimney in the ground or only the gate to that chimney. Let us call the chimney a 'raise' and the gate a 'chute.'

**TIMBER.** While underground I noticed an aromatic fragrance due to the use of cedar. This cedar comes from Coos Bay, in California, and is called the Port Orford cedar. It is used in timbering permanent ways, because experience has shown that the life of Oregon pine (the Douglas fir) is only four or five years, whereas evidence goes to show that the cedar will last at least

three times as long. The adoption of it is an economy because it saves the re-timbering of the main level during the time it is required for haulage. Steel and concrete are used wherever, in the principal openings, the ground is heavy or where several openings converge. At such points it is customary to construct concrete piers with steel caps of 8-inch H-section. Steel was tried in one of the withdrawal-drifts, but it was not successful, because not even steel will hold the weight of settling ground and any repair is more difficult where steel is fixed than where sets of timber have been placed. At one time steel caps were bolted to the posts, but the movement of the ground sheared them off; since then spreaders—plank two inches thick—have been used under the steel cap. Various timber-protectives have been tried, such as (1) creosote, both the full-cell (using 12 lb. creosote per cubic foot of wood) and the open-cell (using only 6 lb.) method; (2) burnitized timber, subjected to heat, vacuum, and then impregnated with zinc chloride at the rate of 6 lb. per cubic foot. This second method is best adapted to timber not exposed to water, for zinc chloride is soluble. 'Date-spikes,' nails made of galvanized iron, with the date impressed upon their heads, are driven into the timber in order to furnish correct information concerning their length of service in the mine.

The timbering of No. 4 shaft has been creosoted. Once done, this is satisfactory, but the job itself is unpleasant, because the creosote makes the wood slippery and the fume is hard on the tear-glands, like the lacrimosal shells used today on the battlefield. In 1910 when the Giroux shaft was being sunk in the Ely district the men struck on account of the unpleasant effects of the creosote, so that this treatment of the timbers was abandoned after ten sets had been put in place.

**VENTILATION** has not been ignored. At the 570-ft. level a blower drives air into the top-slicing stopes, through one set of raises, while another set of raises is connected with an exhaust-fan placed on the surface at the top of a special air-raise, thus ensuring a constant circulation of fresh air. The top-slice is hard to ventilate because there is no opening through the back of it; it is large laterally; the air is warmed by the heat, partly chemical and partly mechanical, generated in the mat of timber overhead. In 1914 a fire started in No. 4 shaft, at about 150 ft. below the collar, owing to short-circuiting of electric cables within a 3-inch iron pipe. The heat of the electric arc fused the pipe and set fire to the shaft-timbers. Now the electric conductors are carried into the mine through a cased churn-drill hole of 8-inch diameter. In these mines at Miami, as in all mines, one is reminded of the fact that the consumption of air by the drills is an insignificant part of the output of a compressor, as likewise is the cost of power used in underground electric haulage when compared with the total cost of haulage, it being slightly over 1%. Comparisons based on the consumption of either air or electricity for such purposes in order to prove the efficiency of a particular type of machine are too often fallacious. The difference of consumption between one machine and an-

other is negligible compared with the use in other directions or the wastage.

**LABOR.** The daily output of the Miami mine is 6300 tons; this is done by 760 men, so that the output per

FIG. 7

man is 8.3 tons. In the shrinkage-stopes the output per trammer is 40 tons and per drill-shift 1905 tons. Once caving begins in the stopes, drilling is needed only to 'bulldoze,' or break the excessively large pieces. In the

FIG. 8

top-slicing stopes the output per miner is 47.2 tons, and per shoveler 16.4 tons. The consumption of powder is 0.31 lb. per ton of ore and of lumber 7 ft. board-measure.

At the surface 13 men are employed in the timber-framing shop, 8 in the blacksmith-shop, and 11 in the machine-shop, making 32 in all. The cost of dynamite, fuse, and caps is 0.7c. for shrinkage and 6.22c. per ton of ore for top-slicing. The cost of timber, lagging, boards, planks, and poles is 4.28c. for shrinkage and 22.54c. per ton for top-slicing. Shrinkage requires 229 drill-shifts per month and top-slicing 1453 drill-shifts in the same period. A drill-shift is worth \$2.496 in air, drill-repairs, sharpening, pipe-line, machine-oil, and purchases of drill-parts, but not including the wages of the machine-man. The total underground labor cost is \$130,000 per month, of which \$102,000 goes to stoping;

FIG. 9

800 men are employed underground and of these 630 are in the stopes. Based on ore delivered to the haulage-level, the output of ore by slicing is 8 tons per man and of shrinkage 21 tons.

The working force for the whole mine consists of 4 foremen on salary, 30 bosses on day's pay, 98 machine-men, 330 shovelers and chute-men, 216 timber-men and helpers, 40 miscellaneous, 65 in connection with electric haulage on the main level, and 30 hoisting, this last including engineers, firemen, oilers, cagers, skip-tenders, and top-landers, the grand total being 809.

(To be Continued)

THE United States is the largest producer and consumer of talc in the world, according to the U. S. Geological Survey. The softness, absorptive capacity, difficult fusibility and solubility, and electric resistance of talc make it one of the useful minerals in the arts and industries. Its principal military use is to prevent sore feet among marching soldiers. Although the War has stimulated production it has not greatly increased the price.

# Method of Filing Drawings

By ALBERT G. WOLF

The several methods of filing drawings in mine-offices may be classified as follows:

1. Horizontally and flat { (a) In drawers.  
(b) On trays.
2. In vertical filing-cases.
3. Rolled { (a) In drawers.  
(b) In open racks.  
(c) In pigeon-hole compartments.  
(d) In tin cylinders.
4. Bound, on arch bill-files or by wooden strips on a rack, like newspapers in a library.
5. On spring rollers.

The first of these methods, that of filing flat in drawers, is in common use; it is considered the best by some engineers and the worst by others. It has the advantages of keeping the drawings flat and clean, and the sheet desired can be easily found. Some of the disadvantages, such as the difficulty of getting a drawing out from under a pile of others, or back again, without damage, or having to remove all drawings above it, can be minimized by making the drawers fairly shallow, and by having two or three sizes of drawers for different sizes of drawings. Weights can be used, if found necessary, to keep the corners of maps from being caught when moving the drawers in and out. The one disadvantage that cannot be overcome is the large floor-space required. If the set of drawers, however, be only table high, the top will serve for desk-room, and a well-finished set of drawers is not an unsightly piece of furniture in the office.

The tray system has the advantage that as the trays are closer together, many more of them than drawers can be put in the same space, hence, fewer drawings will be placed on each tray, and a closer subdivision of titles is possible. The set of trays can be enclosed in a cabinet with hinged doors, making the whole as dust-proof as any book-case. The use of trays, of course, presupposes that the drawings are absolutely flat. Drawings that have been rolled can be placed in large envelopes or containers, like those supplied with vertical filing-cases. Fig. 1 shows in elevation the method of constructing a set of trays. The horizontal dimensions may be anything desired up to four feet without the trays sagging materially. Two or three sets of trays of different sizes for various sized maps may be used, as with drawers.

Vertical filing-cabinets have the great advantage of large capacity for the small floor-space required. They also keep the maps clean, and the large number of compartments makes closer classification possible. The dis-

advantages are such as to make the use of the vertical cabinet undesirable when floor-space for drawers or trays is available. Lifting the large pockets, containing many drawings, in and out of the case is an inconvenience in itself. The small maps slip down, losing themselves between the larger ones, making it difficult to find them. The pockets, if heavily laden, wear out rapidly. If the drawings are all bound together at the top, instead of using the pockets, much trouble is involved in removing one of these drawings from the set. These vertical cases are furnished in only relatively large sizes, so that for small drawings they are a decided disadvantage.

Rolled maps in drawers take up a great deal of room, unless several maps are rolled together, in which case it is difficult to find the sheet wanted. All rolled maps, of course, have the disadvantage that they are harder to handle than maps kept flat. Very large maps, however, can only be filed without folding when rolled. Open racks are of two forms: one, consisting of vertical strips on the walls, with pegs projecting upward at an angle a little less than a right angle (Fig. 2). This method is hardly suited to filing a large number of maps because of the wall-space required, difficulty of finding a map, and unsightliness. A use for this rack is found in closets and vaults, and especially to support such drawings as are filed in tin tubes. The second form of open rack consists of a rectangular skeleton frame, as shown in Fig. 3. The numerous cross-pieces furnish support for smaller drawings. The over-all dimensions may be anything desired. The pigeon-hole compartment method is a variation of the skeleton rack, with the disadvantage that short drawings get pushed back into the compartments and are difficult to get out. Both forms have the objections inherent to methods of filing rolled maps; they do not keep the maps clean, and are not adapted to filing a large number of maps, or drawings, without crowding or rolling many maps in the same roll. The skeleton form has the advantage that maps of any width (length of roll) can be filed without having an unduly large frame.

Filing rolled maps in tin cylinders is adapted to only a small number of maps, but is an excellent method of protecting (from dust, moisture, and other injury) tracings of large maps that are brought up-to-date periodically for the purpose of making prints. As only a few maps are filed in this manner, the cylinders are conveniently placed on the peg-rack shown in Fig. 2.

Method 4, that of binding the drawings together and suspending in some manner, is one more adapted to grouping prints that are constantly referred to in the

office, rather than as a method of filing original drawings or tracings, as its use necessitates the removal of many drawings before the one desired can be extracted, and the drawings are not protected from dust, etc. Two methods of binding are suggested here: the first, using

The last method, that of using spring-rollers, can hardly be considered alone as a method of filing, but is an excellent way to protect a few large general maps, such as a contour or geological map of a State, claim-map of a district, etc., to which constant reference is made.

FIG. 1

FIG. 2

FIG. 3

FIG. 4

the arch bill-file with a backing in proportion to the size of maps filed, and for large maps, two sets of arches on the backing instead of one; the second, by using two strips of wood, say,  $\frac{1}{2}$  by 2 in., held tightly together by bolts and thumb-nuts (Fig. 4B). These groups of maps are then suspended by means of the binding strips on racks (Fig. 4A).

The maps are then as convenient for reference as the ordinary flat wall-maps, and less wall-space is consumed.

At most plants, no one system of filing will suffice unless the number of drawings is very small. Wherever any one of the systems of flat filing is used, it must be supplemented by filing in rolls the larger tracings that must not be folded.

# Zinc-Dust as a Precipitant in Cyanidation

By W. J. SHARWOOD

\*In the cyanide process, gold and silver are dissolved from crushed ore as double alkali-metal cyanides, from which they may be precipitated by such positive metals as sodium (amalgam), aluminum, or zinc, or by electrolysis. Two extreme conditions may be noted. Some works, especially slime-plants practising decantation, use a relatively large volume of solution—possibly 4 or 5 tons per ton of ore—nearly all of which may require precipitation, so that the solutions handled are of much lower value per ton than the ore. On the other hand, in some leaching-plants it is possible to extract with very little solution, and to percolate some of this more than once through the charge before precipitation, so that the solution to be precipitated may be much less than half the weight of ore, and proportionally richer. Solution intended for further use need not have all its precious metal removed, but any that has to be thrown away should be impoverished as far as is economically possible.

In spite of certain advantages possessed by other precipitants, zinc in some form has been almost universally used. In some of the first attempts to utilize cyanides as gold solvents, a 'piece of plate of zinc' was suggested as a precipitant, but extension of surface was early recognized as a desideratum.

Macarthur and the Forrests adopted a 'metallurgical filter' of zinc shavings, turned from disks or rolled sheets. They had previously experimented on other forms of zinc, and Macarthur records having tried zinc-dust, which had been long known as a general reducing agent. It had also been known and used as a precipitant of precious metal from plating and photographic solutions, and comminuted zinc had been patented for recovering copper and other metals from ore-leaches. Other inventors proposed the making of zinc powder by the attrition of balls of zinc, and by similar means, during the passage of a stream of gold-bearing solution.

Sulman claimed the use of zinc-dust, or fume, in a special apparatus, effecting a more or less regular feed of dust and solution by means of intermittent siphons; the mixture or 'emulsion' rising with diminishing velocity through an inverted cone in which it deposited most of its burden, and being clarified by passing a baffle-box and finally a cloth filter. This system was used at Deloro, Ontario.

The first cyanide plants in the United States to use zinc-dust were the Mercur (Utah), treating coarsely crushed oxidized or roasted ore, the Drumlummon (Montana), and Delamar (Idaho) tailing-plants, followed by

the Homestake (South Dakota). All these treated large tonnages and used filter-presses to catch the precipitate; the first three, and the Homestake when first installed, used square presses of the Johnson type, but differing in size and design. Nearly all the larger cyanide installations on the American continent now precipitate with zinc-dust, and the Merrill triangular press has almost entirely superseded other forms for this purpose. Zinc-shaving is still used almost exclusively in South Africa, and in the smaller plants elsewhere. Aluminum-dust is used to a limited extent, chiefly on Canadian silver ores.

**ZINC-DUST.** The early method of applying zinc-dust was to fill a vat with pregnant solution, agitate, add the dust, and pump through the filter-press. The zinc was first introduced by stirring the body of solution mechanically and sprinkling the dust on the surface. A variation was the use of compressed air at the vat-bottom, through a small central cross or coil of perforated pipe. In a few seconds this set the solution in violent motion, and the zinc-dust was then scattered on it with a shovel. This was at best a disagreeable job, and the introduction of oxygen at the precipitating stage was opposed to chemical theory. Elimination of air, however, and cautious sifting of the zinc-dust over the surface before pumping, showed imperfect precipitation—for instance, some tests gave only 75% of the gold precipitated as against 96% with thorough agitation by air.

To obviate the use of dry dust, various attempts were made to add it in the form of an 'emulsion' or suspension in water or in cyanide solution.

Bosqui's zinc-dust feed-system has two relatively small tanks, alternately filled and emptied by means of a tilting launder that actuates a counter and throws a measured charge of zinc into the tank to be filled; the zinc is continuously stirred by jets of solution on a revolving agitator.

Mr. Mills has a set of vacuum filter-frames submerged in a vat through which the mixture of zinc and solution is circulated by a centrifugal pump, while settling is overcome by revolving rakes. At one plant such precipitate as settled on the tank-bottom was allowed to accumulate there, while only the suspended portion went to the filter-press. Two grades of precipitate were thus produced, the settled material being decidedly lower in value and harder in texture.

Elsewhere, when the solution was pumped nearly to the tank-bottom, a man entered the vat in rubber boots and swept settled material toward the pump-intake, a small amount of fresh solution being used to assist the sweeping out. In spite of this sweeping there was a tendency for hard lime-zinc scale to accumulate on the bot-

\*A paper to be presented at the St. Louis meeting of the A. I. M. E. in October.

tom, and to some extent on the tank-staves, so that after six months there might be several thousand dollars' worth of solution thus tied up in a pair of large vats, only recoverable by periodical 'scaling' in which hammers and chisels were used. Pumping a large tank to the press might occupy two to six hours, and one might expect re-solution to take place during this period when all the zinc was added at the start. Repeated tests showed that, although the precipitation by mere agitation was far from perfect, very little re-solution took place during pumping, but the part played by the zinc accumulated in the press was evidently an important one.

The amounts directly precipitated ranged from 20 to 90%, while after passing the press 92 to 98% of both precious metals had been removed, but only 1 to 40% of the copper. Recently the positive removal of oxygen from the entire body of pregnant solution before adding zinc has been carried out on a working-scale. Long-continued tests show that, by subjecting the solution to a vacuum during pumping, a considerable economy is effected, both in the amount of zinc-dust consumed, and in the acid required for the subsequent refining. Patent has been applied for in connection with this modification of the process.

Turbid and cold solutions, extremely low in alkalinity and free cyanide, present the most unfavorable conditions for precipitation. The quantity of zinc-dust required per ton is not proportional to the precious-metal content, depending largely on the amount used in side-reactions.

**CONTINUOUS PRECIPITATION.** In adding zinc-dust to a moving stream, as it is termed in the Merrill patent, a uniform feed is essential to secure maximum efficiency, the volume added per ton being often so small that any diminution becomes temporarily fatal to precipitation. Feeders of various forms have been designed and used. One of the first and most satisfactory consists of a slow-moving horizontal belt on the surface of which is spread a charge of zinc-dust in a layer of uniform width and thickness. The zinc usually falls into a small mixing cone, through which an auxiliary stream of solution passes, carrying the zinc by a small pipe to the pump-intake. A slow drip of lead acetate or nitrate, or of strong cyanide solution, may be added here to facilitate precipitation. Many ingenious elaborations have been devised to secure uniformity in the fall of zinc and the flow of auxiliary solution and chemicals. Formerly the zinc and auxiliary solution in the mixing cone were continuously agitated by a small jet of compressed air. According to data published by Clark† a saving of about one third of the zinc was effected by eliminating this air-agitation of the zinc-feed, and preventing air from being drawn into the mixing cone.

Another good feeder has a cylindrical roller or pulley slowly revolving at the lower end of a hopper, conveying a narrow ribbon of dust, the thickness of which is con-

trolled by an adjustable slot; or an auger-like horizontal screw may remove the zinc from a similar hopper. All such hopper-fed devices require jarring mechanism to prevent the zinc-dust from bridging. A miniature tube-mill has been introduced as a mixer to smooth out irregularities in the zinc-feed.

**FILTER-PRESSING.** Solution intended to be precipitated and thrown away may be run by gravity to a press at a low point; if for further use, it is generally pumped to a press at a considerable elevation, from which it falls to a storage-tank. If the distance between intake and press is considered insufficient to allow of complete reaction, it is increased by leading the pipe in a zigzag line. A zinc-press with gravity feed, the clear effluent elevated by a pump to storage, has the advantage over a pump-fed press in that zinc and precipitate are kept out of the cylinders and valve-chambers; the claim is, however, made that the pump-feed gives better precipitation with a given proportion of zinc.

A close filtering medium is necessary to retain zinc-dust and the extremely fine precipitate obtained from low-grade gold solutions. In early practice the medium was sometimes paper between two cloths, or a single thickness of chain-cloth—a rather expensive fabric. Chain-cloth or cheaper heavy canvas may be covered with a light cheap twill, which is removed and burned at each clean-up to recover adhering precipitate, while the heavy backing is occasionally washed or treated with hydrochloric acid to remove limey accumulations. Another plan is to use two thicknesses of medium-weight cotton-twill, the outer being taken off at each clean-up and either washed or burned. The other then becomes the outside cloth and a new or washed cloth is put under it for the next run. One square foot of net filtering surface for 1.5 tons (say, 50 cu. ft.) solution per day, or 6 tons per hour for 100 sq. ft., may be taken as a conservative ratio: with clear solutions a press may be run at double this rate for long periods. Colloidal suspended matter soon increases the pressure and reduces the pumping rate.

Two-inch distance-frames are suitable for a press used on gold solutions, 3-in. or 4-in. for silver. When a press is opened, most of the cake readily falls into the wheeled tray placed beneath and the remainder is removed by scrapers. It is normally soft but sometimes caked hard as a result of oxidation or the presence of calcium carbonate; this condition can often be controlled by excluding air from the solution.

It was early found advisable, and is still the custom, when starting up a zinc-press after a clean-up, to add to the first charge 50% or more zinc in excess of the weight normally required; this is gradually diminished in successive charges, until the regular amount has been reached. If the zinc-feed is cut too low at any time, no effect may be noted until several charges have been thus treated, then the 'barren' assays rise suddenly and it becomes necessary to add a considerable excess for several charges, until normal working has been restored.

†The Mining Magazine' (April 1910), Vol. IV, p. 289.

Apparently a certain excess of zinc must be maintained in the press, or re-solution takes place there to some extent. This is evident when a press stands idle for several hours; the effluent samples, caught during the first few minutes of pumping, will be abnormally rich—occasionally richer than the pregnant solution entering the press.

**FINESSNESS OF ZINC-DUST.** The virtue of zinc-dust as a precipitant is explicable by its fine state of division or, what amounts to the same thing, its extended surface. Waldstein's patent claimed that the zinc oxide, invariably present, formed a beneficial galvanic couple with the metal, while Sulman's process involved the preliminary removal of oxide by a solvent. In early practice it was noted that dust containing 1 or 2% of lead was more effective than purer samples, and this was confirmed by laboratory tests on synthetic alloys. Cadmium seems to have but little effect. That fine division is the main factor is indicated by the fact that the finest unoxidized metallic zinc, made by grinding sifted filings, and levigating in absolute alcohol, can be made even more effective as a precipitant.

To get some idea of working conditions in using zinc-dust on the large scale, the particles may be assumed to be equal spheres of a diameter which we may take as 0.0001 inch. One pound of this assumed zinc-dust will then contain 7544 million particles and will expose 1650 sq. ft. of surface, which is much greater than the surface of an equal weight of shaving. In precipitating gold, the practical minimum of zinc-dust is probably between 0.1 and 0.2 lb. per fluid ton of 32 cu. ft., or 50 to 100 parts per million of solution. One tenth of a pound, uniformly distributed through a ton of solution, would give some 13,650 particles per cubic inch, spaced at an average distance of about 0.042 inch. If we could substitute particles of half the diameter, the same weights of zinc-dust per ton would give eight times as many particles per cubic inch, at half the distance apart. These considerations make evident the desirability of obtaining zinc-dust in a fine state of division, and the bad effect of stray coarse short or agglomerated masses. In strong solutions, rich in silver, it is probable that the economic limit of fineness would soon be reached; with gold solutions, it seems unlikely.

**EFFICIENCY OF PRECIPITATION.** Zinc-dust is sometimes valued by the percentage of zinc actually in the metallic state, estimated by the reducing effect on ferric sulphate or chromic acid; or the difference between total zinc and zinc as oxide may be taken as metallic. As a guide to its precipitating value this is insufficient, and the fineness, or the speed of reaction, must be considered. As a rule, a good zinc-dust will nearly all pass a sieve of 200 meshes to the inch, and in some zinc-dusts now obtainable very little over 1% is retained by a 300-mesh sieve. In either case, the coarser portion is merely accidental material—crystalline aggregates, a few shots, or foreign matter.

A precipitating efficiency of 100% assumes pure zinc, 1 atom of which should precipitate 2 atoms of silver

or its equivalent in gold or copper from the double cyanide. At this rate 1 unit weight of zinc should precipitate 6.03 units of gold, 3.30 of silver, or 1.93 of copper, but in actual practice the results are much lower. Applied to commercial dust, the laboratory test usually shows an efficiency value of 30 to 60%. Some extremely fine and pure 'artificial' zinc-dusts, prepared by re-distillation of spelter, have shown laboratory efficiencies of 75% or more, and pure electrolytic zinc-powder is claimed to be equally good. Otherwise the efficiency is generally higher when lead is present to the extent of a percentage or two. Distinctly coarse or granular zinc preparations generally show low results.

Judged by the actual precious metal precipitated, the working efficiency on a large scale may be a mere fraction of 1% in the case of low-grade gold solutions. A considerable amount of zinc is always wasted in side-reactions, such as the evolution of hydrogen, reducing dissolved oxygen, or precipitating copper and lead. With rich silver solutions the efficiency may approach 50%, especially if no attempt is made to recover the last traces of silver.

A practical example of mixed precipitation may be taken from the records of the Drumlummon tailing-plant, covering three seasons, or 24 months of treatment of sandy tailing by leaching, the silver being largely in excess of the gold.

Sand treated .....	290,000 tons
Solution precipitated .....	390,000 tons
	Lb. Av.
Precipitate obtained .....	104,000
Zinc-dust used .....	113,600
Metallic zinc in dust .....	102,240
Zinc remaining in precipitate....	40,300 = 39.4%
Zinc dissolved .....	61,940 = 60.6%
Gold in precipitate.....	2,380 = 0.39% efficiency
Silver in precipitate.....	16,000 = 4.75% efficiency
Copper in precipitate.....	7,800 = 3.93% efficiency
Total efficiency (Au, Ag, Cu).....	9.07% efficiency

Percentage efficiency is calculated by dividing the weight in pounds by the electro-chemical equivalent (Zn 32.7, Au 197.2, Ag 107.88, Cu 63.5, and Pb 103.6, under these conditions), dividing the quotient by the number of equivalents of zinc used, and multiplying by 100. The metallic zinc in dust has been taken throughout at the approximate figure of 90%.

Another instance may be taken from the published results† of a months run (May, 1911) of Sand Plant No. 1 of the Homestake Mining Co., in which the silver is about 1% of the gold value. Some lead was added to the solution as nitrate and recovered in the precipitate.

The gold showed 1.18% efficiency, the silver, 0.73%, and the copper 0.19%, in the weak solution, making a total efficiency of 2.1%. The same total efficiency (Au, Ag, Cu) in the low solution was only 0.71%.

That such low efficiencies are tolerated in gold extraction is explained by the fact that, when 'low solution' is going to be thrown away, it is obviously worth while to extract the last two cents worth of gold recoverable, if this can be done at the expense of one cent

†Trans. Inst. Min. & Met., Vol XXII, pp. 142, 149.

for zinc, making a fair allowance for refining cost. With zinc at 14.5c. per pound, 1 oz. Troy costs one cent. If this ounce is used to precipitate 0.001 oz. of gold (2c.) from a ton of waste solution the practice is defensible, although the actual chemical efficiency attained is less than 0.002%.

**DUST v. SHAVING.** The practical efficiencies obtained with zinc-dust have been, generally speaking, about the same as with zinc-shaving, and the accumulation of zinc in the solutions is about the same; greater variations occur between two plants using the different precipitants on similar ores.

The dust process involves a more expensive installation than the zinc-shavings, but has the advantage of greater compactness and cleanliness, and involves less labor in maintenance and cleaning up as well as less risk of theft. The periodical clean-up is absolute, while a hold-over of several thousand dollars' worth of precious metal commonly occurs with zinc-shaving, and makes it impossible to compare the actual with what is often called the 'theoretical' recovery. After a destructive fire, precipitate in a filter-press has been found intact, while zinc-boxes have entailed great difficulty in the attempts to recover their contents. At a gold-plant a press occupying a floor-space of 5 by 14 ft. can easily carry a month's accumulation of \$40,000. The comparative cost of the two systems at any time depends, of course, upon the wage-scale and the relative prices of zinc-dust and spelter.

**COMPOSITION AND TREATMENT OF PRECIPITATE.** Except in the absence of coarse fibres in the former, there is no essential difference in the composition of zinc-dust precipitate and that obtained with shaving. Both contain metallic gold and silver, usually co-precipitated as an alloy, sometimes amalgamated with mercury or alloyed with copper or with zinc itself—some zinc being apparently re-precipitated electrolytically with the precious metal. Any lead in the solution is also thrown down, while any lead and cadmium in the zinc-dust remain with the undissolved zinc, which may form 20 to 70% of the dry weight of precipitate. Calcium carbonate, moisture, and fine-ore particles make up the total, with sometimes calcium sulphate or zinc ferrocyanide and basic cyanide. Lead, mercury, and silver may be present either as metals or sulphides, the latter condition resulting from sulphur compounds in the solution. Blowing air through the press to dry the precipitate causes rapid oxidation of zinc, and consequent heating. Dilute sulphuric acid, followed by thorough washing, removes most of the zinc and lime, and more or less copper, while lead, cadmium, mercury, and silica remain with the precious metals. The mercury may then be removed by drying and heating in a retort with a little lime. Imperfect washing leaves zinc sulphate, and this, like calcium sulphate or sulphides, yields a matte in the subsequent refining. Hitherto no way has been found to utilize the zinc-sulphate solution, impure and generally saturated with calcium sulphate, which is obtained in the acid treatment of precipitate.

Acid treatment, or lead refining and cupellation, or a combination of the two, is necessary before melting low-grade precipitate. Richer gold precipitate, and that from most silver ores, may be fused with a suitable flux, directly or after roasting, yielding fairly fine bullion.

## German Cyanide

James W. Gerard, recently American Ambassador at Berlin, states: "Another commodity upon which a great industry in the United States and Mexico depends is cyanide. The discovery of the cyanide process of treating gold and silver ores permitted the exploitation of many mines which could not be worked under the older methods. At the beginning of the War there was a small manufactory of cyanide owned by Germans at Perth Amboy and Niagara Falls, but most of the cyanide used was imported from Germany. The American-German company and the companies manufacturing in Germany and in England all operated under the same patents, the English and German companies having working agreements as to the distribution of business throughout the world. The German Vice-Chancellor and head of the Department of the Interior, Delbruck, put an export prohibition on cyanide early in the War and most pig-headedly and obstinately claimed that cyanide was manufactured nowhere but in Germany. Therefore, he said, if he allowed cyanide to leave Germany for the United States or Mexico, the English would capture it and would use it to work South African mines, thus adding to the stock of gold and power in war of the British Empire. It was a long time before the German manufacturers and I could convince this gentleman that cyanide sufficient to supply all the British mines was manufactured near Glasgow, Scotland. He then reluctantly gave a permit for the export of 1000 tons of cyanide, and its arrival in the United States permitted many mines there and in Mexico to continue operations and saved many persons from being thrown out of employment. When Delbruck finally gave a permit for the export of 4000 tons more of cyanide the psychological moment had passed and we could not obtain through our State Department a pass from the British."

PRACTICALLY every industry requires the use of sulphur in some form, and the United States, to be industrially independent, must therefore have an adequate supply. The record of the last three years, according to a recent statement issued by the U. S. Geological Survey, shows that this country has enough sulphur to support its present industries even under the requirements imposed by the drain of a large foreign demand. The two main sources of sulphur are the native mineral and the sulphides. Each year at least 300,000 long tons of native sulphur and 1,250,000 long tons of sulphides are used, principally for making sulphuric acid.

## Zinc-Burning

By W. R. INGALLS

\*The manufacture of zinc oxide directly from the ore is one of the most important contributions that America has made to the metallurgy of zinc. Hitherto this has been done chiefly for the production of zinc and zinc-lead pigment under the name of the Wetherill process. The principles involved are capable of broader application and are discussed under the term 'zinc-burning'. In zinc-burning, either in blast or reverberatory smelting, the gangue of the ore is scorified and drawn off as slag while other metallic minerals are reduced to matte or metal. F. L. Bartlett first employed the blast-furnace and used an ore-column 18 inches high. In certain blast-furnace practice in the iron industry zinc-burning has been effected as an incident in the smelting of iron and spiegeleisen. The reverberatory offers advantages over the blast-furnace because there is no shaft to be clogged by accretions. Early attempts abroad to use the reverberatory were not commercially successful. Frederick Laist, at Anaconda, Montana, first used the reverberatory successfully for zinc-burning on a large scale. This was done early in the present year, for the extraction of zinc in the residue of the leaching from electrolytic zinc extraction.

The Wetherill grate-furnace, unlike a blast-furnace, produces a clinker and at the same time volatilizes the zinc and lead in the ore. Its operation is difficult and requires much skill where a pure pigment is desired, but for concentrating zinc no great skill is necessary. The process is so simple that attention is being increasingly directed to it. Its application is indicated for (1) the concentration of low-grade zinc ore, especially calamine, thereby saving freight and treatment charges on worthless gangue, and for (2) the recovery of zinc in the leached residue from electrolytic zinc works. It is possible that it may be found to be most economical in the electrolytic process to roast the ore, burn it on Wetherill grates, and leach the fume.

Whether the Wetherill grate or the reverberatory furnace is used will depend on the nature of the gangue, the precious-metal content of the ore, and the commercial and metallurgical conditions that prevail. Lead is even more easily burned out of an ore, either in Wetherill or reverberatory furnaces, than zinc. The fume from a lead-zinc ore will contain both lead and zinc. Sulphur in such an ore will cause the presence of sulphur in the fume. Silver in some ores will largely go into the fume and in others it will remain in the residue. The conditions determining the behavior of silver are not well understood. No hard and fast rules can be laid down as to choice between the Wetherill grate and the reverberatory. As yet the data on the subject are insufficient.

Reverberatory smelting for zinc-burning follows the

same lines as for the treatment of copper ore. Sufficient carbon must be mixed with the charge to reduce the zinc oxide. Great excess over the theoretical amount is unnecessary, nor is it necessary that the reverberatory fuel be greatly in excess of what is required in copper smelting. The critical factor is the slagging of the zinc, but, by the maintenance of a neutral or reducing atmosphere the zinc content of the slag may be reduced to low figures and the extraction of zinc as fume may compare favorably with that obtained by Wetherill grates. It is important, once the oxide of zinc is reduced, to give it the best chance possible to be volatilized, and to allow oxidation above the bath, not in it. Good work in the reverberatory may make a slag with only 3% zinc and this compares well with the zinc content of the cinder made in the best zinc-burning.

In the use of labor and fuel the large reverberatory of the Anaconda type is superior to the Wetherill. With a smaller reverberatory the difference will be less. For the small plant treating ores containing no precious metals and of an essentially acid or basic type, the Wetherill grate is most advantageous. With ores of a self-fluxing nature or with appreciable precious-metal content the reverberatory has the advantage, since smelting can be accomplished coincidentally with the expulsion of the zinc.

MAGNESITE is reduced to magnesia either in 'dead-burned' or sintered form, or in what is known as 'caustic calcined' form. Dead-burned or sintered magnesite has been so strongly heated that essentially all its carbon dioxide and moisture have been driven off and most of the shrinkage taken up. In this condition it is chemically very inert—that is, it is not subject to attack or disintegration even under extreme heat. The caustic form is not so thoroughly calcined; it still retains 1 or 2% of carbon dioxide and is thus a product more like ordinary caustic lime in its properties, although not quite so active chemically. Caustic magnesite 'slacks' when exposed to the air, re-combining with moisture and carbon dioxide. Combined with calcium chloride it forms a distinctive cement known as sorel or oxychloride cement, which is much favored by builders for floors and other places where tile or special finish is desired. This is probably the most important use to which pure caustic calcined magnesite is put, although it is used also for making liquors in which wood pulp is digested to make paper, as well as for other purposes.—U. S. Geological Survey.

COMPARING the mineral output of Japan in 1916 with that of 1907, the 'Japan Times' states that within 10 years a remarkable increase has resulted. Copper increased by 160%; lead, 269%; and iron, 194%. This has been accompanied by higher prices, so that output-values show increases as follows: Copper, 238%; lead, 561%; and iron, 340%. The aggregate output-value of zinc, antimony, and phosphorus mines shows an increase of 172%. Compared with the output of 1912 the increase is 124%.

\*Abstract of paper to be read at the St. Louis meeting of the A. I. M. E., October 1917.

# Report of Committee on Petroleum

## Some of the Conclusions and Suggestions

**UTILIZATION.** Far beyond the borders of California, her petroleum and its products play a vital part in commerce and industry.

California fuel oil operates the Panama Canal; the greater part of the steam railroads of Washington, Oregon, California, Nevada, Utah, Arizona, and New Mexico; the steamship lines along the Pacific coast from Mexico to Alaska and across the ocean to Hawaii; the artificial gas plants of California, Oregon, Washington, Nevada, Arizona, and Hawaii; the mines and smelters of California, Nevada, and Arizona; the cement plants and sugar refineries of California; and a substantial portion of the manufacturing, industrial and agricultural enterprises of the Pacific Coast States of the Union.

California fuel oil supplies the Pacific coast fuel requirements of the United States Navy and Army and of the various state and municipal governments.

Radiating from California, north, west, and south, California fuel oil, to a considerable extent, operates the railroads and industries of western Canada; the sugar refineries and railroads of Hawaii; and the railroads, steamship companies, mines and smelters of the west coast of Central and South America.

The products of California petroleum, such as kerosene, gasoline, distillates, lubricants, and road oils meet the requirements of Arizona, California, Nevada, Oregon, Washington, Alaska, and Hawaii. California kerosene is shipped in enormous quantities to China, Japan, India, and Australia and to the western coast of Central and South America. California distillates and lubricants are sold in nearly every important State of the United States, as well as in England, Canada, and Australia.

Important as is the part which California petroleum and its products have heretofore played in the industrial life of the nation during times of peace, much more important is the part which the State should play and will play, if possible, in meeting the emergency in the supply of fuel oil, gasoline, and lubricants, created by the War.

**PRODUCTION.** California produces between one-fourth and one-fifth of the world's supply of petroleum. One-third of the entire supply of the United States is produced in California.

The year of California's greatest production was 1914, in which year 103,620,000 bbl. were produced. Production fell in 1915 to 89,570,000 bbl., and increased slightly in 1916 to 91,820,000 barrels.

Notwithstanding the fact that a net average of 52 new wells was added to the producing wells of California during each month from January to May, 1917, inclusive, and the fact that drilling during these months was more active than during any other period in the last three or

four years, the daily production was slightly less in May than in January.

Unless the measures hereinafter recommended for increasing production are adopted, it is improbable that the production in 1917 will exceed the 1916 production by more than 2,000,000 bbl., if at all.

From the data available to us, we are convinced that the public cannot hope for further substantial increases in California's annual petroleum supply by the discovery of important new fields or of large extensions of existing fields.

**CONSUMPTION.** The consumption of California petroleum in 1916 was 104,930,000 bbl., being more than 13,100,000 bbl. greater than the production. The excess was taken from storage.

Consumption in 1916 outran production an average of 1,100,000 bbl. per month and 35,650 bbl. per day.

During the first five months of 1917, consumption outran production 5,415,000 bbl., being 1,083,000 bbl. per month and 35,860 bbl. per day.

Due to normal increase in consumption as well as the additional extraordinary requirements of the War which are already being felt, it is doubtful whether consumption in 1917 can be reduced below the consumption of 1916, notwithstanding the substitution of other fuel or power and the further possibilities of conservation pointed out in this report.

Consumers of California petroleum will shortly face a condition of decreasing production and increasing demand. This condition points inevitably to the necessity of developing other sources of fuel or power.

**STORAGE.** Crude oil stocks in California have fallen from 57,147,000 bbl. on December 31, 1915, to 44,036,000 bbl. on December 31, 1916, a reduction during the year of 13,100,000 bbl., or 23%.

Standard Oil Company reports that during the first five months of 1917 the field and pipe line crude oil stocks of all companies were further depleted as follows:

1917	Storage depletion in barrels
January .....	976,036
February .....	1,031,960
March .....	854,333
April .....	1,197,475
May .....	1,355,318
Total .....	5,415,122

The total remaining storage on June 1, 1917, is reported to have been slightly in excess of 38,000,000 barrels.

A portion of the crude oil in storage cannot be utilized

## Zinc-Burning

By W. R. INGALLS

\*The manufacture of zinc oxide directly from the ore is one of the most important contributions that America has made to the metallurgy of zinc. Hitherto this has been done chiefly for the production of zinc and zinc-lead pigment under the name of the Wetherill process. The principles involved are capable of broader application and are discussed under the term 'zinc-burning'. In zinc-burning, either in blast or reverberatory smelting, the gangue of the ore is scorified and drawn off as slag while other metallic minerals are reduced to matte or metal. F. L. Bartlett first employed the blast-furnace and used an ore-column 18 inches high. In certain blast-furnace practice in the iron industry zinc-burning has been effected as an incident in the smelting of iron and spiegeleisen. The reverberatory offers advantages over the blast-furnace because there is no shaft to be clogged by accretions. Early attempts abroad to use the reverberatory were not commercially successful. # Report of Committee on Petroleum

## Some of the Conclusions and Suggestions

**UTILIZATION.** Far beyond the borders of California, her petroleum and its products play a vital part in commerce and industry.

California fuel oil operates the Panama Canal; the greater part of the steam railroads of Washington, Oregon, California, Nevada, Utah, Arizona, and New Mexico; the steamship lines along the Pacific coast from Mexico to Alaska and across the ocean to Hawaii; the artificial gas plants of California, Oregon, Washington, Nevada, Arizona, and Hawaii; the mines and smelters of California, Nevada, and Arizona; the cement plants and sugar refineries of California; and a substantial portion of the manufacturing, industrial and agricultural enterprises of the Pacific Coast States of the Union.

California fuel oil supplies the Pacific coast fuel requirements of the United States Navy and Army and of the various state and municipal governments.

Radiating from California, north, west, and south, California fuel oil, to a considerable extent, operates the railroads and industries of western Canada; the sugar refineries and railroads of Hawaii; and the railroads, steamship companies, mines and smelters of the west coast of Central and South America.

The products of California petroleum, such as kerosene, gasoline, distillates, lubricants, and road oils meet the requirements of Arizona, California, Nevada, Oregon, Washington, Alaska, and Hawaii. California kerosene is shipped in enormous quantities to China, Japan, India, and Australia and to the western coast of Central and South America. California distillates and lubricants are sold in nearly every important State of the United States, as well as in England, Canada, and Australia.

Important as is the part which California petroleum and its products have heretofore played in the industrial life of the nation during times of peace, much more important is the part which the State should play and will play, if possible, in meeting the emergency in the supply of fuel oil, gasoline, and lubricants, created by the War.

**PRODUCTION.** California produces between one-fourth and one-fifth of the world's supply of petroleum. One-third of the entire supply of the United States is produced in California.

The year of California's greatest production was 1914, in which year 103,620,000 bbl. were produced. Production fell in 1915 to 89,570,000 bbl., and increased slightly in 1916 to 91,820,000 barrels.

Notwithstanding the fact that a net average of 52 new wells was added to the producing wells of California during each month from January to May, 1917, inclusive, and the fact that drilling during these months was more active than during any other period in the last three or

four years, the daily production was slightly less in May than in January.

Unless the measures hereinafter recommended for increasing production are adopted, it is improbable that the production in 1917 will exceed the 1916 production by more than 2,000,000 bbl., if at all.

From the data available to us, we are convinced that the public cannot hope for further substantial increases in California's annual petroleum supply by the discovery of important new fields or of large extensions of existing fields.

**CONSUMPTION.** The consumption of California petroleum in 1916 was 104,930,000 bbl., being more than 13,100,000 bbl. greater than the production. The excess was taken from storage.

Consumption in 1916 outran production an average of 1,100,000 bbl. per month and 35,650 bbl. per day.

During the first five months of 1917, consumption outran production 5,415,000 bbl., being 1,083,000 bbl. per month and 35,860 bbl. per day.

Due to normal increase in consumption as well as the additional extraordinary requirements of the War which are already being felt, it is doubtful whether consumption in 1917 can be reduced below the consumption of 1916, notwithstanding the substitution of other fuel or power and the further possibilities of conservation pointed out in this report.

Consumers of California petroleum will shortly face a condition of decreasing production and increasing demand. This condition points inevitably to the necessity of developing other sources of fuel or power.

**STORAGE.** Crude oil stocks in California have fallen from 57,147,000 bbl. on December 31, 1915, to 44,036,000 bbl. on December 31, 1916, a reduction during the year of 13,100,000 bbl., or 23%.

Standard Oil Company reports that during the first five months of 1917 the field and pipe line crude oil stocks of all companies were further depleted as follows:

1917	Storage depletion in barrels
January .....	976,036
February .....	1,031,960
March .....	854,333
April .....	1,197,475
May .....	1,355,318
Total .....	5,415,122

The total remaining storage on June 1, 1917, is reported to have been slightly in excess of 38,000,000 barrels.

A portion of the crude oil in storage cannot be utilized

because it is located below the outlets of tanks and reservoirs or is being used for the operation of oil pipe lines or for other reasons. Of the total stocks on June 1, 1917, not in excess of 32,000,000 bbl. were available for use. Of this amount, 12,000,000 bbl. were refining oil and would yield approximately 7,000,000 bbl. of residuum. On June 1, 1917, there were available from crude oil stocks approximately 27,000,000 bbl. for fuel.

If the present excess of consumption over production, amounting to an average of 1,083,000 bbl. per month, continues, the entire available storage of California fuel oil will be exhausted by June 1, 1919.

If a margin of safety of 10,000,000 bbl. of fuel oil is maintained, and if the present relationship between production and consumption continues, the margin of safety for fuel oil will be reached by September 20, 1918.

If consumption is materially increased, as seems likely, both because of normally increased requirements, as well as the extraordinary requirements of the War, or if production decreases, as seems likely unless the relief herein recommended is given, both the margin of safety and the complete depletion of all California stocks will be reached considerably prior to the dates indicated.

The principal railroads of California, with the exception of the Southern Pacific Company, have made the necessary arrangements to meet their requirements for at least one year.

At the present rate of production by Kern Trading & Oil Company, the Southern Pacific Company's fuel oil bureau, bearing in mind also the purchase of fuel oil by the Southern Pacific Company, including 1,000,000 bbl. bought from Union Oil Company and not as yet drawn on, and bearing in mind also the Southern Pacific Company's consumption of fuel oil, the Kern Trading & Oil Company's storage of fuel oil will be exhausted by December, 1917, unless the recently augmented drilling operations of Kern Trading & Oil Company increases the Southern Pacific Company's production and unless the Southern Pacific Company effects a substantial saving of fuel oil by converting to coal those portions of its system which are located in proximity to the coal fields of Washington, the Rocky Mountain States, and New Mexico. If the receipts of fuel oil by the Southern Pacific Company decrease or its consumption increases, the depletion of its stocks will occur before December 1, 1917.

If the Kern Trading & Oil Company's storage should be exhausted, it would be necessary for Southern Pacific Company to enter the market to purchase oil from general stocks in storage, which amounted on June 1, 1917, to slightly over 38,000,000 bbl. These stocks are owned principally by Standard Oil Company and Union Oil Company. If these companies should be unwilling to sell to the railroads fuel oil from their storage, we assume that the Federal government would have the right to commandeer the stocks and to compel their delivery for the operation of the railroads as long as the stocks hold out. Such action, if on a large scale, would necessarily deprive other industries of petroleum and its products.

**CONSERVATION.** Field losses of petroleum in the California fields have been almost entirely eliminated and the amount of fuel oil used in field drilling and pumping has been largely reduced by the substitution of natural gas and electric energy. The operators are now generally taking steps to reduce the remaining use of approximately 8500 bbl. of fuel oil daily by the installation of jacks and electric motors. The use of fuel oil in the fields for pumping and drilling cannot be entirely eliminated.

The principal petroleum refineries of California are working on improved processes of refining. The amount of crude oil which is being refined is increasing and a proportionally larger amount of gasoline and lubricants is also being secured. The result has been a large surplus of kerosene which it has been necessary to export to the Orient, Australia, and Central and South America.

Mexican petroleum was substituted early in 1917 for California petroleum amounting to approximately 2,750,000 bbl. annually, heretofore sold by Union Oil Company in Chile. A considerable portion of the remaining 3,000,000 bbl. of California fuel oil sold in 1916 on the west coast of Central and South America, including the Panama Canal, can likewise be saved by the substitution of Mexican petroleum from the fields of Tampico and Tuxpam. By reason principally of transportation difficulties, Mexican petroleum will not be available, during the War, as a further substitute for more than 3% of California petroleum. After the termination of the War and the resumption of normal transportation conditions, we may assume that Mexican petroleum will play an important part in the commerce and industry of a considerable portion of the Pacific coasts of North, Central, and South America.

Coal cannot be substituted for California fuel oil to any substantial extent during the War because of present difficulties in the production and transportation of coal. Approximately 1,000,000 bbl. of California fuel oil will be saved in the ensuing year in the North-West by the substitution of coal for California fuel oil by the Oregon Short Line and other industries. The Los Angeles & Salt Lake Railroad Company and the Western Pacific Railroad Company are converting a portion of their systems in Utah and Nevada from California fuel oil to coal produced in the Rocky Mountain States. The Southern Pacific Company and the Atchison, Topeka & Santa Fe Railway Company can also gradually convert from fuel oil to coal those portions of their systems which are in proximity to the coal fields of the North-West, the Rocky Mountain States, and New Mexico. Apart from what has already been accomplished and the further possibilities herein indicated, there is little possibility of further conversion from California fuel oil to coal during the War, unless the conditions surrounding the production and transportation of coal materially change.

Powdered coal has been successfully used in cement plants, stationary boilers or power plants and metallurgical furnaces. One cement plant in the North-West has recently converted its plant from California fuel oil

to powdered coal, resulting in a saving of 84,000 bbl. of California fuel oil annually. Apart from a possible slight additional saving in the North-West, it is not reasonable to expect that powdered coal will be further substituted for California fuel oil during the War.

Hydro-electric energy has already been substituted to a considerable extent for California fuel oil in industrial and agricultural uses, but the difficulty in securing copper and other material and the disturbance of existing conditions are such that large additional savings of California fuel oil by the substitution of hydro-electric energy cannot be anticipated during the War. A small saving of California fuel oil can be effected, during the War, by the further substitution of electric motors for fuel oil in the California oil fields and by such interconnection between the systems of various electric companies as will eliminate or reduce the necessity of maintaining steam-electric plants. After the termination of the War and the restoration of normal industrial conditions, we may expect that hydro-electric energy will play an increasingly important part as a substitute for fuel oil in all the Pacific Coast States in which such energy is available.

Natural gas has already been substituted to almost the entire extent of its supply, for fuel oil in the California petroleum fields, and for fuel oil and artificial gas for higher industrial and domestic uses. The maximum production of natural gas in the California petroleum fields has been reached and will shortly decline so that it is not to be anticipated that natural gas will, to any substantial extent, further replace other forms of fuel.

We conclude that during the War some further saving of California fuel oil is possible by elimination of losses and substitution of other forms of fuel or power, but that no large saving can be effected without very serious impairment to the efficiency of the transportation systems and industries of the Pacific coast.

The great importance of gasoline and lubricants must be recognized and steps should be taken as soon as reasonably possible to the end that no more unrefined petroleum is burned by any railroad company or other industry. No part of California petroleum should be thus burned except the residuum left after refining.

If a sufficient amount of fuel oil cannot be secured from Mexico after the War, the railroads and other industries of the Pacific coast must gradually make arrangements to use other forms of energy, such as hydro-electric energy or powdered coal.

**THE REMEDY.** The remedy which imperatively presents itself in view of the emergency created by the War is the prompt and substantial increase in the production of California petroleum.

While we do not desire to minimize the results which can be accomplished and should be accomplished by the further diminution of field losses, the higher use of petroleum and its products and the substitution of other forms of fuel or power, during the War as well as there-

after, the cardinal fact remains that the only means which will be effective in a large way to meet the present emergency is a prompt substantial increase in production.

We estimate that this increased production should amount to more than 35,000 barrels per day and that such increased production cannot reasonably be expected before June 1, 1918.

Each difficulty standing in the way of prompt and substantial increased production must be quickly solved, if the increase is to forestall a serious industrial crisis.

**INCREASED PRODUCTION—MATERIAL.** The necessary increased production cannot be secured unless large additional amount of oil-well casing, drill-stem pipe, and other oil-well material are promptly brought into California.

The oil-well supply-houses report that they can fill no orders for complete drilling-outfits in addition to those already taken.

The larger oil companies have on hand or have heretofore placed orders for enough material to complete their 1917 drilling operations as heretofore planned, but have no material for additional drilling beyond such plans. Many small operators report that they would drill if they could secure the necessary material, but that it has been impossible for them to secure such material, even at the high prices now prevailing.

Receiver Payne reports that he is willing to drill, if authorized by the Federal court, but that he does not know where he could secure the necessary material unless the Federal government should take the necessary steps to assist the California producers.

In our opinion, the only way to meet the situation, in view of the existing conditions, is to have the Federal government direct the manufacturers of oil-well supplies to devote sufficient capacity of their plants to supply the requirements of oil producers in California and other sections of the United States and to direct the railroads to transport such supplies promptly.

**INCREASED PRODUCTION—LABOR.** Over 80% of the laborers who are employed in the oil-fields and refineries are skilled men, most of whom it would be difficult to replace. If any considerable number of these men are taken from their present employment it will be impossible to increase the production of petroleum in California and difficult to maintain the present production.

About 3% of these men have already left their employment and have volunteered for service in the various branches of the Army and Navy. About 32% of these employees have registered for the draft.

We suggest the advisability of drawing this situation to the attention of the Federal government.

**INCREASED PRODUCTION—THE LAND.** In order to secure an increase of 35,000 barrels per day in the production of California petroleum, drilling must be done on the land which will yield the largest production in the shortest time by the expenditure of the smallest amount of drilling material and labor.

# Upflow Clarification of Solution

By A. W. ALLEN

When in South Africa in 1913 I devised a conical clarifier shown in Fig. 1 to be used in connection with an experimental counter-current continuous-agitation cyanide plant. The apparatus worked so satisfactorily that the idea was subsequently elaborated as a zinc-box clarifier, as shown in Fig. 2. In both cases the filtering medium was composed of small pebbles, small stone, gravel, and sand, in the order named. An apparatus on

THE most important magnesite development of the year 1916, according to the U. S. Geological Survey, is the opening in eastern Washington of large deposits of a coarsely crystalline magnesite that is like marble or dolomite in texture but is essentially magnesite in composition. This material is now being shipped at the rate of several hundred tons per day, and calcining furnaces are in course of erection to prepare magnesia for use in making refractory material and, it is said, also for use in cement mixtures. Coming at a time when the sources of supplies abroad are cut off, the discovery of these deposits appears to be most fortunate. Apparently authentic reports indicate that the deposits are large and

FIG. 1

FIG. 3

FIG. 2

a working scale with filter-cloth in place of the sand-filter (Fig. 3), supported between coarse wire-screen, was then considered, but the idea was not followed up. I took out a provisional patent for a clarifier of this type at Pretoria in March 1913, but abandoned any further interest in the matter on hearing that the system was in operation in the United States. No details were forthcoming, however, but I gathered that something similar had been used for clarifying boiler-feed water.

It would be of interest to know what work has been done along these lines by metallurgists, particularly cyanide operators, and whether as a result some modification of the idea is applicable as a cheap substitute for the ordinary sand-filter.

In the type of clarifier illustrated herewith the filtering medium is cleansed by shutting off the flow and discharging through the sludge-exit. This causes a reversed flow that frees the filter of much of the accumulated solid.

The disadvantages of the conical clarifier lie in the fact that an accumulation of solid on the sides of the cone is inevitable. The disadvantage of upflow clarification through sand is the small capacity of the filter-bed area.

that they will afford a supply of uniform character by relatively cheap methods of mining. It is perhaps too soon to say just how well the material is suited for refractory or other uses, but the present indications are that it may be adapted to some of these uses.

THE National Board of Fire Underwriters advise that open lights or flame of any character should never be permitted for use in the presence of light combustible or volatile inflammable materials, or where inflammable dust is liable to be present; incandescent electric lights in such localities should be of the keyless socket pattern and enclosed in wire guards, with operating switch situated in an apartment separated from the inflammables. If possible, keep oils outside of the main buildings in a separate oil-house. Never keep the main supply of light inflammable oils, such as gasoline or kerosene, inside of the main buildings except in nominal quantities. Illuminate the oil-house safely and so brightly that there will never be a temptation for an employee to light a match in order to see while drawing oil. Catch oil drip in metal pans; never use sawdust or other combustible material to absorb it. Excellent oil-cabinets are made which drip back into the main tank.

# REVIEW OF MINING

## PLATTEVILLE, WISCONSIN

ORE-PRICES.—PRODUCTION.—MINING.

Mining development and equipment are being seriously retarded at all points because of the lack of labor. For five consecutive weeks the price of zinc ore remained on a base of \$70 per ton for standard 60% blende, and ranged down to \$65 for medium and second grades. The limitations on the inferior grades were partly removed so that ore of 52% zinc content was given consideration on the basis of the published quotations. The first part of the month low-grade producers, except where protected by contract, found difficulty in the marketing of their product. Later a better disposition on the part of refiners secured an outlet for low-grade zinc-ore producers but the greater quantity of low-grade product was delivered to the Mineral Point Zinc Co. The high-grade product was in good demand all the month. The buying of the Grasselli Chemical Co. was a feature of the business during August. A few producers mining lean deposits suspended operations in the Montfort and Linden districts.

Lead-ore producers who had been receiving from \$110 to \$130 per ton found it difficult to reconcile the gradual decline in the price of lead ore with the prices ruling in the pig-lead markets and preferred to hold. The first two weeks of August witnessed a few sales but the bulk of the ore, estimated at 1500 tons, was held in reserve. The price of lead-ore fell until it reached \$100 per ton. A fair portion of the reserve was worked off before the offerings dropped under \$100 per ton. The ore was held back as the price approached \$90, and shipments ceased. The Federal Lead Co., represented by N. H. Snow, secured the bulk of the ore offered for sale. A few cars produced by the New Jersey Zinc Co. was shipped to the company's smelter at Palmerton, N. J. The estimates made earlier in the month on reserve lead ore were considered too high, but lead ore came in quantity from districts that were overlooked and careful estimation at the close of the month showed that at least 1000 tons was in reserve. The bulk of the lead ore is obtained as a by-product in the wet concentration of zinc ore, and a greater output of zinc ore is invariably associated with an increased output of lead ore.

The recovery of pyrite was confined to that obtained at reduction plants where electrostatic separation is used. The price for the average Wisconsin pyrite may be put at \$5 per ton. Shippers have found cars available for loading rather restricted during the month. Where loading facilities were immediately available deliveries were steady but smaller than heretofore.

No encouragement was given producers of carbonate-zinc ore in the northern part of the field. The price offered Wisconsin miners would be on the basis of \$25 per ton, 40% zinc. Most of the Wisconsin carbonate-zinc ore, termed locally 'dry-bone,' contains 30% zinc and brings the miner about \$15 per ton. Occasionally higher-grade ore is found and the scale is adjusted up or down on the basis of \$1 per unit. Thousands of tons of this class of ore are available for mining and are used by the principal buyer, the New Jersey Zinc Co., for the manufacture of zinc oxide. The New Jersey Zinc Co. has recently completed arrangements that will give the company tonnage from the mines where this ore is obtainable.

The mine production, shipped during August, follows:

District	Zinc, lb.	Lead, lb.	Pyrite, lb.
Benton .....	25,268,000	768,000	.....
Mifflin .....	8,862,000	152,000	.....
Linden .....	3,008,000	84,000	600,000
Galena .....	2,888,000	90,000	.....
Platteville .....	1,776,000	.....	.....
Hazel Green .....	1,696,000	60,000	.....
Highland .....	1,470,000	126,000	.....
Shullsburg .....	1,254,000	394,000	56,000
Dodgeville .....	984,000	70,000	.....
Potosi .....	726,000	.....	.....
Mineral Point .....	434,000	.....	.....
Cuba City .....	.....	.....	3,642,000
Total .....	48,366,000	1,744,000	4,298,000

WISCONSIN ZINC REGION

Shipments of high-grade dressed zinc ore from ore-dressing plants were made to smelters as follows:

	Pounds
Mineral Point Zinc Co.....	6,064,000
Benton Roasters and Wisconsin Zinc Roasters.....	5,196,000
National Separators .....	4,584,000
Linden Refining Co.....	496,000
Total .....	16,340,000

The sales and distribution of zinc ore during the month of August are as follows: To Mineral Point Zinc Co., 6515 tons; Grasselli Chemical Co., 4796 tons; Wisconsin Zinc Co., 4495 tons; Vinegar Hill Zinc Co. to National Separators, 4657 tons; American Zinc Co., Hillsboro, Ill., 3256 tons; Linden Zinc Co., 1537 tons; Matthiessen & Hegeler Zinc Co., La Salle, Ill., 755 tons; Illinois Zinc Co., Peru, Ill., 702 tons; American Metals Co., 667 tons; Benton Roasters, 374 tons; Lanyon Zinc Co., 205

tons; Edgar Zinc Co., 151 tons; American Zinc & Lead Smelting Co., 117 tons; total 28,227 tons.

In the Highland district a rich strike by the Mineral Point Zinc Co. was surveyed on the range for the Saxe-Lampe Mining Co. and prospect work with a drill showed that the range carried into the Saxe-Lampe ground, giving new life to the latter. Underground development was hastened to connect both finds. For the Mineral Point Zinc Co. much new ground was opened up on the Red Jacket mine at Centerville and an increased output is now assured.

No important developments were undertaken in the Montfort district. At Linden, the Saxe-Pollard interests are engaged in developing two new mines, one on the Treloar and one on the Kickapoo lease. Two shafts, one-half mile apart, are being driven to ore-level. After cross-cuts have been driven the management will consider the advisability of supplying a complete surface-plant midway between the two mines to afford milling-facilities. New ground was developed on the Optimo No. 3 mine. Another producer in the district, the Lucky Five Mining Co., is holding several hundred tons of zinc ore, both hand-cobbed and concentrate. The North Survey Mining Co. is developing new deposits. The Mineral Point Zinc Co. operated continuously, producing concentrate, and shipping large quantities of high-grade zinc-oxide. In addition one car of 66% sulphuric acid per day was shipped. Utt-Thorne Mining Co. brought several leases up to production.

In the Mifflin district the New Jersey Zinc Co. and the Vinegar Hill Co. are making a steady production. The New Phoenix mine promises to be a regular shipper. Other producers are the Grunow, Peacock, Royal, Lucky Six, Biddick, Big Tom, and Squirrel mines. Prospecting in new ground is active.

The Platteville district made little showing in August. The Block House Mining Co. made the principal production. The New Rose Mining Co. was organized under L. N. Piquett to operate the Old Mexico mine. A power and milling plant, \$15,000 in value, is reaching completion on this mine.

Two magnetic zinc-ore dressing plants are in operation in the Cuba district. The C. S. H. Mining Co. is completing a concentrator. In the Shullsburg district large low-grade deposits have developed in the Winskill mine. The McDermott Mining Co. is producing lead ore.

Shipments of crude ore from the Benton district were at the rate of 65 to 70 cars per month during the first half of August, but were somewhat lower in the second half. Shipments of high-grade ore were small in the first and large in the second half-month. Price declines hastened the shipments. The Domestic Mining Co. opened a new producer and will install a new mill. The Frontier Mining Co. completed a power, mining, and milling-plant on the Hird mine.

The new Wilkinson Mining Co., on the George Wilkinson farm, is driving for a deposit that was discovered by drilling. The Grand View Mining Co., composed of Indianapolis mining men, established a surface-rig here one year ago and was successful in discovering a deposit of carbonate-zinc ore. The poor market offered compelled the company to suspend operations and the plant has been closed. Several cars of high-grade carbonate-zinc ore concentrate were sold to the American Zinc & Lead Smelting Co. The largest production for the month came from the Wisconsin Zinc Co., the Frontier Mining Co., and the Vinegar Hill Zinc Co. The production of the Meloy mine, a recent Vinegar Hill development, was delivered to the Grasselli Chemical Co. The New Jersey, the Fox, the Penna-Benton, and the New Hoskins mines failed to maintain the production-record usually attained by them.

The Hazel Green district showed further decline. The Cleveland Mining Co. made an indifferent showing. The Vinegar Hill Zinc Co. is completing a new 200-ton milling plant at the Jefferson mine. In the Potosi district the Wilson Mining Co. maintained a normal shipment of one car of high-

grade wet concentrate per week. The Tiffany Zinc Co. withheld ore from shipment until the latter part of the month when it sent several cars to the Mineral Point Zinc Co. It carried a moderate reserve at the close of the month. The Mudd Range Mining Co. re-built the Dinsdale mill and completed its underground development.

## BUTTE, MONTANA

### NEW COMPANY ORGANIZATION.—LABOR SITUATION.

The Big Foot Mining Co. has just been organized in Butte. The company is incorporated for 600,000 shares with a par value of \$5. The object of the company is to develop seven claims in the Big Foot district in Jefferson county, 12 miles from Boulder. The property has not been operated for 20 years, and at that time was operated for the silver in the ore. The ore contained silver, lead, and zinc, and therefore at that time had to overcome a large penalty, which made operation unprofitable. There are several shallow shafts, ranging in depth from 50 to 200 ft., in the strike of the main vein. All of these shafts will have to be de-watered, and where this has been done, fair assays have been obtained.

Labor Situation.—On September 6 a strike vote was taken by two metal trade unions, the machinists and the blacksmiths. Both failed to get the needed majority to declare a strike. The machinists, who, according to international rules, must have a majority of three-fourths to strike, voted 133 for and 85 against. The blacksmiths, who needed a two-thirds majority to strike, voted 54 for and 54 against a strike. The result of the voting seems to indicate that the independent companies will continue operating. All of the electricians who walked out from the mines some time ago have returned to work. Independent companies in Butte are working now, with the exception of those who ship their ore to the Anaconda company's smelters at Anaconda and Great Falls. An early settlement of the labor situation is expected at the smelters. The concentrator owned and operated by M. W. Atwater, at Basin, was forced to shut-down, due to the labor trouble in Anaconda and Great Falls. Work will be resumed as soon as the smelter commences operations.

## COBALT, ONTARIO

### AUGUST SHIPMENTS.—MINING CORPORATIONS.—NIPISSING MINES.

The total ore shipments from the Cobalt district for the month of August amounted to 49 cars. There is a slight shortage of labor, but in general operations are satisfactory. During the first six months of the current year the price of silver averaged 75.44c. per oz. With the price of silver over 95c. per oz. and with an average of 85c. during August, it is evident that the average for 1917 may be above 80c. per oz. Such being the case, the value of this year's production, probably 20,000,000 oz., will reach \$16,000,000.

Mining Corporation and Nipissing Mines are striving for first place among the shipping mines of the district. During the first half of 1917, 2,000,000 oz. of silver bullion was shipped by the Mining Corporation. The Nipissing production is about the same. The two companies are sending out almost one-half the total production of the district. The affairs of the Temiskaming are now much in the public eye, due to the controversy between Max Morganstern, a heavy shareholder of the company, and the present mine-management. A special report has just been made by B. E. Neilly, manager of the Penn Canadian mine, in which it is shown that there is from 400,000 to 450,000 oz. silver in the available ore. The report compares with that recently issued by the management, and which was apparently the starting-point in the difficulty. Morganstern has threatened to oust the present board of directors, claiming to have control of sufficient stock to do so. It appears to be

probable that another report will be made by a representative of Morganstern. The Neilly report just issued, dealing, as it does, with only 'positive ore,' leaves room for conjecture as to whether additional estimates can be made on 'probable' or 'indicated' ore.

## PORCUPINE, ONTARIO

HOLLINGER.—SCHUMACHER.—MCINTYRE.

Mining operations in the district are more satisfactory than for several months past. The Hollinger production is understood to be greatly improved and the output for the current year, despite the adverse conditions in the labor market in the early summer, will be almost on a par with that of the preceding year. The milling facilities at the gold mines of northern Ontario, taking into account the grade of ore at each of the producing mines, are sufficient for the production of \$18,000,000

the management of this mine has not only been able to bring the mill up to capacity, but has also been able to add materially to the ore-reserves and to break a very large tonnage of milling ore in excess of that possible to handle with the present milling facilities. It is now believed probable that a decision will shortly be made for the adding of further equipment which will bring the milling-capacity up to 1000 tons per day. The average grade of the McIntyre ore is \$12.50 per ton, and with an output of 600 tons per day the gross bullion-input will be \$7500 per day.

At the Porcupine Crown, since the suspension of dividend disbursements, the policy of the management has been to carry on milling operations at a rate sufficient only to pay the expenses of development work. Development is being carried on, and with a return to normal condition in labor supply and the cost of material, a period of production is at hand.

The installation of a mining-plant at the Anchorite is progressing, and this property will soon be classed among those active in the development stage in this district.

With ore-reserves at the West Dome Con. officially estimated at over \$2,000,000, and with reports of arrangements about to be made for the installation of a new mill, this property would appear to be about to occupy a good position among the smaller mines of Porcupine.

## LEADVILLE, COLORADO

MANGANESE ORE.—RE-SMELTING SLAG.

At the Bohn shaft on East Second street near the Penrose of the Down Town Mines Co., a discovery of manganese ore has been made by a company of lessees headed by Peter Horrigan. The orebody, which was encountered on the 440-ft. level, has been developed by driving and raising. The present dimensions are 12 ft. high, 44 ft. long, and 15 ft. wide. The top and end of the shoot have not yet been reached, and it is estimated that the deposit will prove to be from 200 to 300 ft. long and more than 100 ft. high. Compared with other deposits of

manganese ore that have been opened in the district, the Bohn strike exceeds them in the size of the orebody and the purity of the ore. Assays show the ore to average 40% of manganese. None of the assays are below 35%. The material contains 8% silica and 14% iron.

Driving and raising will be continued until the walls have been reached. The fact that the orebody lies along the eastern side of the Cloud City fault is considered to indicate favorable conditions for the occurrence of a large deposit.

Operations at the Bohn were started in January, when Horrigan and associates secured a lease from the Down Town Mines Co. The property had been idle for 25 years, and offered a difficult problem to the lessees as the shaft was caved from a point 85 ft. below the collar to the bottom-depth of 500 ft. The lower level was reached late in July, requiring seven months to reclaim the shaft. Development was started at 440 ft. A drift was carried to a point 300 ft. north. A 30-ft. raise intersected the bottom of the orebody at this point.

Preparations are being made on the surface to handle an output of 100 tons per day.

An important project for the recovery of metal from old dumps has been launched and is being worked out at the old Harrison reduction works. A company known as the Harrison Recovery Co. has been organized by Fred J. Johnson, James Fyfe, and Fred F. Furnas. It is the purpose to repair the

per annum. For the first half of 1917 the gold output amounted to \$4,586,941. Working-forces are steadily improving in numbers, and there is an improvement in efficiency. There is now no talk of striking, and with the close of the harvesting season in the West labor will be obtained more easily.

The directors of the Schumacher mine have announced their intention of sinking the main shaft to a depth of 1000 ft. The position of the mine would appear to warrant deep mining as it lies adjacent to the Hollinger, as also does the McIntyre. The tongue of porphyry, along the contact of which the Hollinger is finding highly productive orebodies, extends in an easterly direction, partly on the McIntyre and partly on the Schumacher. The McIntyre long drift on the 1000-ft. level is on the north contact of the porphyry belt. The Schumacher proposes to go to a similar depth and prospect the south contact. Not long ago a diamond-drill, operating in the McIntyre, tapped the downward continuation of the north contact at a depth of over a quarter of a mile and the orebody was of uniform width and contained high-grade ore. It is the opinion of mining men of the district that operations will be successful along this contact to a considerable depth.

The mill of the McIntyre-Porcupine is now running and production is understood to be between \$6000 and \$7000 per day. Despite the adverse conditions during the past twelve months,

blast-furnaces at the Harrison works and re-smelt the slag-dumps which assay from 6 to 300 oz. silver per ton. Both lead and copper are present in small amounts. One of the furnaces has been repaired and is ready for operation. An incline-track, equipped with a 2-ton skip, has been constructed from the old dump to the top of the furnace. After completing preparations, 200 tons per day will be smelted by the furnace. Other furnaces will be put into operation as rapidly as they can be overhauled.

Data compiled from tests on the slag-dump show that from each 500 tons of slag 50 tons of matte, containing 3000 oz. of silver, will be recovered. A market for the product has already been secured at the plant of the Ohio & Colorado S. & R. Co. at Salida.

The Denver & Rio Grande Railway Co. is rapidly completing the standard gauging of the line to the mines in Big and South Evans gulches and Breece hill. The work has reached to within two miles of the Ibex and is expected to be completed during the next two weeks. A large tonnage of ore will be handled over this line when finished. Lessees on the Silent Friend mine in South Evans gulch have opened a large body of lead-zinc sulphide ore and have started shipping at the rate of 50 tons per day. A small shoot of zinc-carbonate ore has also been uncovered on the upper levels. The Matchless mine on Fryer hill is to be operated again. Edward Huter, formerly superintendent at the Square Deal mine at Frisco, representing Denver capitalists, has secured a lease on the mine and has started the work of re-timbering the shaft. It is planned to sink through the parting-quartzite into the ore-zone existing between the porphyry and the white limestone.

### HOUGHTON, MICHIGAN

#### CALUMET & HECLA AND MINERALS SEPARATION.—EXPENDITURES FOR ELECTRICAL INSTALLATIONS.

The decision of the U. S. Supreme Court on the validity of the claims of the Minerals Separation company will without doubt induce other companies to use flotation in lessening tailing-loss. While conditions at other properties do not offer the same opportunities of success as at the White Pine and the Calumet & Hecla, they are at least encouraging. At the Calumet & Hecla the flotation process was introduced months ago under an arrangement with Minerals Separation which permitted operation on a royalty basis contingent upon the outcome of the law-suits. At the termination of the controversy Calumet & Hecla concluded their contract and as a result flotation will be applied on a larger scale in the mills at Lake Linden. A recovery of 70% has been made in the treatment of slime that resulted from the amygdaloid tailing. The leaching process will be continued but used on material wherein the copper particles are coarser than 200 mesh. At the White Pine, one of the subsidiary properties of the Calumet & Hecla, flotation is successfully applied.

At the Wolverine the vein continues in the foot-wall in No. 4 shaft, due to the dip of the formation at the bottom, the 43rd level. This is the mining-limit in the shaft. The copper content at the bottom is better than it has been for four levels and the laterals are expected to open a grade of rock up to the old-time Wolverine average. Last year the 39th and 40th levels extended to the boundaries, but the three levels below have yet to reach their full length. The 40th level has not been exhausted. Wolverine continues to obtain 40% of its copper from the vein in the foot-wall in the old stopes.

Rock from No. 1 and 2 shafts of the Ahmeek is better than 14 lb. per ton, and the average from the North Ahmeek is better than 20 pounds.

In addition to maintaining a fair shipment of high-grade rock, the South Lake is finding mass-copper. While it is not large, it is larger than the 'barrel copper' and goes directly to the smelter.

The enlistment of miners is more than compensated for by the influx from Butte. These are mostly Cornish miners, many of them trained in the tin mines. The working-force employed here is over 22,000.

An estimate places the amount of money expended and represented in contracts by Lake Superior mines for electrical equipment, being installed or about to be installed, at \$1,000,000. Much of this is for underground-tramming. Calumet & Hecla is now installing a 10,000-kw. turbine at the mill at Lake Linden and is scrapping two steam-engines to make room for it.

The Tamarack, now owned by the Calumet & Hecla, has copper in its tailing. In 1913 the company started a reclamation plant to handle the conglomerate sand. The building will now be finished and the machinery installed. It will be patterned after the Calumet & Hecla's re-grinding plants.

Laterals at 220 ft. in the White Pine Extension open up 1800 ft. of mining-ground, all in copper-bearing rock. At the 440 good rock extends over 400 ft. in both directions from the shaft.

### CRIPPLE CREEK, COLORADO

#### PRODUCTION.—DEVELOPMENT.—MILLING.

The August production from the properties of the Gold Dollar Con. Mining Co., on the eastern slope of Beacon hill, totalled 12 cars, or about 325 tons of ore, ranging in value from \$15 to \$18 per ton. Al Osberg is mining ore from a 14-ft. vein at present being developed on the 600-ft. level of the Mable M. shaft.

The Camp Bird M., L. & P. Co., John Nichols superintendent, operating the mines of the Rose Nicol Gold Mining Co., on Battle mountain and Bull hill under a six-year lease, has made an important discovery. The lateral extending into the Rose Nicol from the 1000-ft. level No. 2 shaft of the Portland Gold Mining Co. has entered an ore-shoot within the Rose Nicol claim. The ore is being stored underground until an ore-house can be constructed. The Rose Nicol shaft is down 720 ft., and is being sunk as rapidly as possible to connect with the Portland lateral.

Hahnwald, Olsen, and associates, operating the Gold Sovereign M. & T. Co.'s mine on Bull hill, are doing lateral work on the new 1600-ft. level. The lessees are mining and shipping two cars of ore each week from the shoot under development on the 1100-ft. level. The ore is of average milling-grade.

The Queen Bess mine, on Tenderfoot hill, owned and operated by August Hahnwald, Olsen, and associates, produced 14 cars or about 500 tons of ore in August of a value in gold between 1½ and 2 oz. per ton.

The local milling-plants of the Portland are now treating approximately 2000 tons of low-grade mine and dump-ore per day. The Victor mill is treating 600 tons, and the remodelled Stratton's Independence mill 1400 tons per day. The average grade of this ore will not exceed \$2.25 per ton.

The Roosevelt tunnel of the Cripple Creek Deep-Drainage & Tunnel Co. was advanced 155 ft. in August. The flow is constant at 5450 gal. per minute.

### LORDBURG, NEW MEXICO

#### CONCENTRATION PLANTS.

Concentration plants in which flotation will be used are to be immediately erected by the 85 Mining Co. and the Lawrence Mining Co. The capacity of the mill at the 85 mine, according to plan, will be 300 tons per day. The capacity of the mill for the Lawrence has not been determined. Final tests will decide the mill capacity of the latter mine. Both mills will be available for custom ores. The plant at the 85 mine will be fitted with separate ore-bins, and will also have a custom-sampler.

## ALASKA

(Special Correspondence.)—Alaska uses 600,000 bbl. of fuel-oil per annum and, in the absence of coal and oil development, must import from California. Falcon Joslin, recently returned from Washington, stated that there is little hope for the modification of the leasing regulations governing the coal and oil-lands in Alaska. Oil-lands were withdrawn from entry seven years ago and development was stopped. Efforts to secure the cancellation of the withdrawal-order were unsuccessful. The coal-leasing act has proved inoperative. The threatened oil-shortage in California and the high shipping rates combined have made the fuel situation acute.

Livingston Wernecke, geologist for the Alaska Treadwell, has been examining property on Chichagoff island. W. J. Rogers, manager of the Mt. Andrews copper mine at Hedley, has been examining mines. The Mt. Andrews is shipping 1000 to 1200 tons per month of high-grade copper ore to the Tacoma smelter.

Treadwell, September 2.

(Special Correspondence.)—A discovery of importance near the head of Talkeetna river has been made by W. M. Foster and B. Whittridge. Samples from the find assay from \$2 to \$40 per ton. F. Spengler and B. T. Spaulding, engineers, are on their way to the discovery.

The Cache creek dredge has had a successful season and will operate until the middle of October. H. Parker is prospecting for platinum in the Mulchatna. A reported discovery of gold ore at Snug Harbor was discredited.

Willow Creek mines have made a light production for the season. There is much new development.

The Hercules Mining Co. is developing a molybdenum deposit on Reid creek. Sulphide and oxide-ore of molybdenum occur in quartz and diorite.

Anchorage, August 1.

## ARIZONA

### COCHISE COUNTY

(Special Correspondence.)—The Denn mine has shipped a car of ore. It is expected that shipments will continue regularly. One hundred and twenty-five men are employed.

Tombstone, September 8.

### GILA COUNTY

(Special Correspondence.)—The Copper Hill Co. has just received an oil-burning engine and other machinery for the extensive development work planned. Since April this company has shipped seven cars of high-grade copper and molybdenum ore.

Globe, September 6.

### GREENLEE COUNTY

(Special Correspondence.)—The strike in the Clifton district continues and has apparently reached a deadlock. There is a general exodus of both American and Mexican miners. In order to break the deadlock, Mayor Coty of Clifton, at the suggestion of the citizens, called a mass meeting of citizens and miners. After a general discussion of conditions, a proposition was agreed upon for submission to the company-managers. The labor organizations ratified this plan and agreed to abide

by the decision of the board. A deputation has now presented the proposition to the mine-managers. Their decision has not yet been made.

Clifton, September 4.

### MARICOPA COUNTY

(Special Correspondence.)—The Arizona Gypsum Co. has been organized by Phoenix people. The company plans the construction of a plant at Phoenix for the manufacture of gypsum products. The property owned by the company comprises 4160 acres near Wickenburg.

Phoenix, September 4.

### MOHAVE COUNTY

(Special Correspondence.)—The Elkhart Extension Mining Co., financed by A. A. Barton and H. M. Russell, of Los Angeles, has taken over the Argyle property and preparations are being made for development. An important strike of silver ore has been made at the New Mohawk in the east drift from the bottom of No. 2 shaft. Five feet of silver ore is exposed. The New Tennessee vein maintains its size and value, there being three feet of ore in the face of the north drift of the 240-ft. level.

Kingman, September 4.

### PIMA COUNTY

(Special Correspondence.)—According to Roos and Tovote, engineers, the Twin Buttes Arizona Mining Co. has opened up a promising prospect. This property consists of three claims, 26 miles south of Tucson. The ore won in development assays in copper 11.5%, \$1.25 in gold, and 8½ oz. per ton in silver. Two cars of ore have been shipped from the Pandora mine in the Mineral Hill district. The Pandora is under lease to D. C. Sullivan. Shaft No. 2 of the San Xavier mine in the Twin Buttes has been shut-down and work commenced at shaft No. 6 on the west side of the property. The Hecla Arizona Mining Co. of the Twin Buttes has shut-down temporarily.

Tucson, September 3.

### YAVAPAI COUNTY

(Special Correspondence.)—The Verde Combination broke shaft-sinking records for the Verde district in August by sinking 163 ft. In the shaft, now at 700 ft., a station will be cut and cross-cutting started to the schist-porphry contact, 200 ft. north. It is expected that mining operations will commence at the Jerome Copper Co. in two weeks. Manager George Kingdon announced that the United Verde Extension shipped 4,500,000 lb. of copper in August. The work on the United Verde Extension haulage-adit is proceeding steadily but the work on the shaft is temporarily at a standstill.

Prescott, September 4.

### YUMA COUNTY

(Special Correspondence.)—The Arizona Manganese Mining Co. is making arrangements to ship ore. A contract has been let to a Los Angeles firm to construct a river-boat and a barge of 30 tons capacity. They will be used to transport ore from the mine to Parker. The mine is 22 miles north of Parker and near the river.

Yuma, September 4.

## CALIFORNIA

### DEL NORTE COUNTY

(Special Correspondence.)—The cinnabar mine on Diamond creek is in operation and quicksilver shipments will soon be made. The Diamond Creek copper mine has been recently examined for Eastern parties.

Crescent City, September 4.

### KERN COUNTY

(Special Correspondence.)—The Yellow Aster Co. is installing a new crushing and screening plant, and completing improvements to the mill. Equipment is arriving and mine operations are being conducted along broader lines. Several small gold mines are producing steadily, and tungsten mining is active at several places. The Black Hawk Tungsten Co. is

sinking a shaft on the Leonard claim, near the Churchill deposit. Small veins have been encountered but sinking will be continued to depth.

Randsburg, September 15.

### SHASTA COUNTY

(Special Correspondence.)—The flotation-plant of the Afterthought Copper Co. has been in operation for several days and is treating a heavy tonnage from the upper levels of the mine. Ore is delivered by the Ingot & Afterthought railroad. The old dump has been purchased by G. C. Taylor, who is sending sorted ore to the Mammoth smelter at Kennett.

The Leonard cross-cut from the main adit of the Shasta-Belmont has cut a vein of copper ore for a width of 13 ft. A second cross-cut will be driven 70 ft. ahead of the Leonard lateral to intersect the vein, and the adit continued to intersect the main deposit.

Indications are good for the resumption of work at most of the mines in the copper region within a few days. The Mountain Copper Co. has over 100 men on the payroll and the Mammoth company expects to operate the Mammoth mine in a few days.

Redding, September 16.

At a mass meeting of miners the striking miners repudiated the agreement made by their committee earlier in the day. The miners are holding out for an increase of \$1 per day in wages. It is expected that a settlement will be made in the immediate future.

### SIERRA COUNTY

(Special Correspondence.)—At the Plumbago mine 76 men are on the payroll and the 15-stamp mill is crushing ore of good grade. Sufficient quartz is exposed to ensure a long run and it is stated that operations will be conducted during the winter.

At the Twenty-One a large bunk-house and other buildings are under construction. Mine developments are proceeding with a crew of 35 men. The mine lies near the Tightner group. Small pockets of rich ore are being found occasionally in the Tightner mine and ore conditions are good. Under A. Hall, superintendent, 60 men are employed and the 10-stamp mill is in operation.

Rich ore has been encountered in the shoot under development in the North Fork mine, at Forest, and arrangements have been made to develop to additional depth. It is reported that a mill will be installed in the spring. George F. Stone is manager.

There is prospective activity in the Howland Flat, Scales, St. Louis, and contiguous districts, and several hydraulic-mining companies are preparing for operations. The impounding-dam on Slate creek will enable many mines to operate for the first time in a generation. Los Angeles capital has been active in this field during the past year.

Alleghany, September 17.

### SISKIYOU COUNTY

(Special Correspondence.)—Arthur Coggins, of Sacramento, is mining chrome on Little Castle creek near Dunsmuir. He is planning a concentrating-plant to reduce the low-grade ore. The plant will be erected at once. Last year the output was shipped to Niagara Falls. The present output is being shipped to the Carnegie Steel Co. and the Electro-Metallurgical company.

C. T. Loftus, of Dunsmuir, and Arthur Coggins, of Sacramento, are shipping from their Boulder Creek molybdenite property, near Lamoine, to the Henry E. Wood Ore Testing Co. at Denver.

Hornbrook, September 6.

Denial is made of the shut-down of the High Grade mine. It is stated that development is in progress and that a 250-ft. adit has been completed during the summer. The owners are D. M. Wall, of Butte, Montana, and D. D. Good, of Ashland, Oregon.

## COLORADO

### BOULDER COUNTY

(Special Correspondence.)—The Nil Desperandum, situated in the Sunshine district, will be re-equipped with electric pumps, shaft-houses, and hoist. The property has been a producer in the past. Operations will be resumed. The Royal Gem Mining Co. of Caribou is preparing to re-open its property. New Orleans capitalists are back of the enterprise. C. E. Wenzel will be superintendent. Woodring & Dupont of the Huron mine are preparing for the winter's work by erecting necessary buildings.

Eldora, September 5.

(Special Correspondence.)—The Longfellow and adjacent mines have been consolidated and a general plan for deeper development is being inaugurated. The Bush, Alice, and other mines are developing and mining ore. G. F. Stringer, president of the Mohave Boulder Tungsten M. Co., is supervising the re-construction of the milling-plant.

Eldora, September 10.

## MONTANA

Work was resumed on September 17 by the Anaconda Copper M. Co. in both mines and mills. At the smelting plants more men applied for work than could be accommodated.

August operations of the Barnes-King indicate 2239 tons, bullion production \$22,800, from the North Moccasin mine and 4586 tons, estimated bullion production \$103,000, from the Gloster and Shannon mines. The balance due, \$44,940, upon the Shannon mine is to be paid at once. The total payment including the balance just mentioned will be \$228,000.

The Anaconda G. M. Co. announces that operations will be resumed on September 17. The union accepts the new scale offered by the company in July.

## NEVADA

## ESMERALDA COUNTY

(Special Correspondence.)—The Goldfield Consolidated Co. is still experiencing trouble in marketing its flotation-concentrate, due to the unwillingness of the custom-smelters to receive a refractory gold product. As a consequence the production and earnings of the company have declined. It is reported here that the directors are considering the erection of a refining-plant for the treatment of the concentrate. Copper-gold ore is again being produced from the 1250-ft. level of the Grizzly Bear mine, where a large body of medium-grade ore has been developed. Much of the richer ore is being drawn from the 600 workings of the Laguna and the 450 level of the Mohawk.

The Jumbo Extension is preparing for the sinking of a deep winze from the 1017-ft. level to prospect the shale and alaskite below.

The Atlanta company has installed on the 1750-ft. level a large compressor, pumps, electric hoist, and other equipment, and will immediately sink a winze to the 2000-ft. level for the purpose of prospecting. Regular shipments of selected ore are being made to custom-smelters, and the company is said to be earning fair profits. The new raise from the 160-ft. level of the Great Bend, about 35 ft. east of the main stope, has advanced 60 ft. in high-grade ore, the working-face disclosing a width of 4½ ft., assaying \$150 per ton. Cross-cutting and driving is in progress on the 300-ft. level, and raises from the level have disclosed good ore. Small shipments are being made, and the management expects to increase the output.

Goldfield, September 18.

## HUMBOLDT COUNTY

The Nevada Packard has granted its employees a 10% bonus of their present wages. The bonus applies to the technical staff as well as the laborers and will be in force as long as silver is quoted at 93c. or more per ounce. The present minimum wage is \$4.95.

## NYE COUNTY

(Special Correspondence.)—The development of the White Caps Mining Co. totaled 161 ft. for the week. The West claim is being prospected. The mill is operating steadily and the anticipated tonnage is being handled.

In the Manhattan Consolidated the shaft has been deepened 108 ft. below the third level. After constructing a sump, the development of the 400-ft. level will be started. No water has been encountered in the shaft.

The Union Amalgamated has completed the development of its orebodies upon the 600-ft. level. The total development for the week was 62 ft. Option to purchase the controlling interest in the company has been exercised and the first payment made upon the stock. It is understood that Whitman Symmes will take charge as consulting engineer.

The working shaft of the Extension and Zanzibar has penetrated the White Caps limestone. After additional depth it is

presumed that lateral development will be extended to the White Caps fault. The hoist and compressor-houses have been completed.

The Amalgamated Extension has made arrangements to resume operations. The shaft will be continued well below the water-level before additional lateral work is attempted. The equipment of the company consists of a hoisting and compressor plant.

Manhattan, September 13.

(Special Correspondence.)—The Tonopah Mining Co. during the week produced 1900 tons of ore. Operations at the Sandgrass shaft have been suspended to re-timber the shaft.

EASTERN NEVADA MINING DISTRICTS

The exploration department was discontinued September 1. During the past five years the Tonopah Mining Co. has acquired an interest in the Tonopah Placers Co., at Breckenridge, Colorado, the Canadian Mines Co., in Manitoba, Canada, the Eden Mining Co., in Nicaragua, the Tonopah Nicaragua Co., the Mandy Mining Co., in Canada, and the Tunkey Transportation & Power Co., in addition to the Desert Power & Milling Co., at Millers, Nevada, and the Tonopah & Goldfield railroad.

The Tonopah Extension's auxiliary power-station, consisting of a steam turbine and a 400-kw. generator, is ready for operation and is to be used in the Victor territory. Development, consisting of 193 ft., was made in the Victor and No. 2 shafts. The tonnage for the week was 2380.

The Tonopah-Belmont produced 2184 tons for the week.

The Jim Butler Tonopah Mining Co. produced 750 tons. Driving on the West End vein from the 816 winze shows a face of low-grade ore.

The bi-weekly shipment of bullion from the West End mill consisted of 31 bars, valued at \$55,930. The tonnage was 909,

from the Ohio and West End shafts, and 48 tons from the Halifax. The 522 raise in the Ohio made connection with the level. In development work, drifts 525, 526, and 520, and raises 523 and 524 showed good widths of milling ore. Conditions in the 717 drift on the east and west side are unchanged.

The Rescue-Eula produced 125 tons, and the Cash Boy 50 tons, making the week's production at Tonopah 8356 tons with a gross value of \$146,230.

Tonopah, September 11.

By a vote of 402 to 317 the mine and mill employees of Tonopah accepted the proposition of the mine operators to grant an advance of 50c. per shift for all who work 20 shifts in one month. A part of the workers voted not to work for a less advance than 75c. per shift regardless of the time employed.

## NEW MEXICO

### SOCORRO COUNTY

(Special Correspondence.)—A new strike was made on the 300-ft. level of the Johnson mine during the past week. This property mills a good grade of ore but the recent find has opened three feet of ore exceeding the average in value.

The Oaks Co. is constructing new ore-bins at the Maud S. mine to provide for an increased production. The bins are arranged for serving either burro or auto-truck.

The recent discovery of high-grade ore in the lower level of the Socorro mine continues to show a good width and value. It is on the 1100-ft. level and, as it is the deepest ore so far opened in the district, it is causing satisfaction.

The Pacific mine production for the past month was increased over the normal.

Mogollon, September 11.

## OREGON

### JACKSON COUNTY

(Special Correspondence.)—The Blue Ledge copper mine is again an object of inquiry. Its sale is forecasted to the English syndicate that owns the Lady Smith smelter at Vancouver, B. C. The copper ore from this mine with that from the Alaskan mines makes an economic flux. Sixteen motor-trucks are employed in hauling ore from the mine to the railroad at Jacksonville.

Andrew Jeldness of Medford, who has been developing the Bloomfield copper mine in the Blue Ledge district, has uncovered a body of rich ore and will start shipping. C. J. Fry of Medford is developing several promising copper veins in the Blue Ledge district.

Operators are active in the Gold Hill district investigating manganese deposits. Recent tests from the Gold Hill iron mine have proved that this ore will produce a low-carbon manganese-iron alloy. Several mines in the Meadows district, north of Gold Hill, will be developed to prove the extent of their manganese deposits.

Medford, September 12.

(Special Correspondence.)—The Blizzard gold mine, two miles north of Gold Hill, was sold yesterday to J. W. Wakefield of Medford, Oregon, and his associates, who are Eastern people. The new owners have been investigating the district and selected this mine. They will re-open the old workings and expect to erect a 5-stamp mill. The vein, in a porphyry and slate-contact, contains free-milling ore, three feet wide. Ore averaging \$40 per ton was reduced in local mills when the mine was in active operation.

Another strike of specimen ore has been made on the old Elashia Ray mine, three miles north of Gold Hill. It is operated by J. W. Davies and associates of Sacramento.

Gold Hill, September 12.

### JOSEPHINE COUNTY

(Special Correspondence.)—Five auto-trucks are being used

to haul ore from the California Chrome Co.'s mine to Waters creek. The haul is 21 miles and 50 tons is shipped per day. The destination of the ore is Niagara Falls, N. Y. At the mine 21 men are employed.

Chrome-deposits are being developed by R. C. Fehely and R. W. Kitterman on Gray Back mountain.

Grants Pass, September 4.

(Special Correspondence.)—C. Long and F. Nelson are developing a copper deposit in the Preston Peaks district.

Chrome ore is to be concentrated at the Dorothea Chrome mine in Coyote creek. Crushers, stamp-batteries, classifiers, and standard tables comprise the mill equipment. The ore contains 30% chrome, associated with serpentine, and it is expected that a 65% concentrate will be made.

Grants Pass, September 4.

(Special Correspondence.)—The Logan placer-mine situated on the Grants Pass-Crescent City highway, two miles northwest of Waldo, has been sold to George M. Esterly and associates of Seattle, Washington. The purchase price is \$140,000. The mine is one of the oldest in the State. Its early history is contemporaneous with the gold-rush to Jacksonville. An option on the property was taken by the new owners ten months ago, and it was operated by them during the past season, the output being \$50,000 in gold and platinum. The property will be operated on a much larger scale. The water-supply permits mining for eight months of the year. The placer-gold is fine, and is accompanied by platinum, together with osmium and iridium.

Grants Pass, September 4.

(Special Correspondence.)—The Waldo copper mine, two miles from Waldo, has been sold to the American Exploration Co. of Grants Pass. The purchase price was \$135,000. The property has been in operation 12 years, but only during the last two years has it been worked with modern machinery. A mill of 50-ton capacity is used to concentrate the ore. Recent production totals \$300,000 worth of copper. The ore is a massive chalcopyrite associated with pyrrhotite and pyrite.

Grants Pass, September 7.

## WASHINGTON

The Northwest Magnesite Co., operating at Chewelah, shipped 11,800 tons of crude magnesite in August. The calcined product aggregated more than 500 tons. The September production is expected to be 15,000 tons of crude mineral and 1500 to 2000 tons of the calcined product.

Arthur L. Lyddane, of Washington, D. C., and C. Edwin Oyster, of Berkeley, California, representatives of the Federal Trade Commission, are in the Coeur d'Alene investigating the cost of producing lead. They are visiting the principal lead-producing districts of the United States. Mine-owners have contended that 8 cents per pound is not enough for this metal while cost of production is so high. This is the price the Government is now paying.

The third dividend of the Loon Lake Copper Co., operating 45 miles north of Spokane, amounting to \$14,513, was paid September 11.

Grant county has a new industry being developed at Quincy by the American Mill & Produce Co. A short time ago this concern bought the lease on a half-section of State land containing infusorial earth, and shipments of the earth are being made to different parts of the United States.

### FERRY COUNTY

For the week ended September 15 the mines of Republic camp have shipped 1250 tons of ore to the smelters, as follows: Quilp lessees, 600 tons; Lone Pine mine, by the Northport Smelting & Refining Co., 500 tons; Knob Hill mine, 150 tons.

The Northport S. & R. Co. has added to its working force at

the Lone Pine mine for the purpose of increasing ore shipments to 150 tons per day.

A discovery of silver-lead ore near Swan lake, 20 miles west of Republic, has been reported and a number of locations have been made.

At the Drummer mine, two miles south of Curlew, the National Silver-Lead Co. has installed a compressor plant for the purpose of extending the main adit, now in 700 ft. and carrying out plans for other development through the fall and winter.

In the Keller district, at the Golden Crown mine a large quantity of ore is on the dump ready for shipment and the ore-body is being developed. The ore is rich and shipments will soon be made after the return of J. C. Davis, manager, from Pittsfield, Illinois. The mine is owned by an Illinois company.

Republic, September 14.

## CANADA

### BRITISH COLUMBIA

(Special Correspondence.)—The heavy demand for copper for war purposes has greatly stimulated the copper mining and smelting industry of British Columbia. Recent returns give the production by the smelters for 1916 at 65,379,364 lb. of fine copper, valued at the average New York price for the metal at \$17,764,494. This is an increase in quantity of 8,460,959 lb. and in value of \$7,948,994 over the output of 1915. The production for the current year will show a still greater increase, owing to the large expansions which are being undertaken by the producing companies. The Granby Consolidated, which during the year ended June 30, spent approximately \$1,000,000 for improvements, has plans in hand which will necessitate even a larger outlay. It has acquired a high-grade coal property, one seam of which shows 20,000,000 tons of coking coal, and is constructing a by-product coke plant which will supply its coke requirements at a low cost. The Canada Copper Co. is opening up a large mine near Princeton, B. C., in which the ore is estimated at 10,000,000 tons. The power to operate this mine will be supplied by the West Kootenay Power & Light Co., a subsidiary of the Consolidated Mining & Smelting Co. of Canada, and the ore will be, for some time at least, smelted and refined at the plants of the company at Trail.

Toronto, September 11.

(Special Correspondence.)—The Granby Consolidated has declared the usual quarterly dividend of 2½%.

It is reported that Eastern interests have acquired 1,400,000 of the 1,600,000 outstanding shares of the Utica mines. The mine is in the western part of the Ainsworth district, West Kootenay.

At the smelting plant of the Canada Copper Corp., at Greenwood, 60 men are employed. A car of blister copper was recently shipped to Trail.

Vancouver, September 7.

The Ladysmith smelter after being closed down for five years has been re-opened. Announcement has been made that the treatment-charge will be \$5 per ton. All of the copper will be paid for with the exception of 0.4%. The price paid for copper will be three cents per pound less than New York quotations, 90 days after the receipt of the ore; 95% of the gold content to be paid at \$20 per oz. (under 0.1 oz. not to be paid for); 95% of the silver content to be paid for at New York quotations; 90 days after the receipt of the ore (under 0.5 oz. not to be paid for).

## MEXICO

The Mexican government threatens to confiscate the properties of the American S. & R. Co. in the State of Chihuahua unless work is started at once. The properties have been idle for two years. It is said that a syndicate of wealthy Mexicans has offered to take over the smelting company.

# PERSONAL

*Note: The Editor invites members of the profession to send particulars of their work and appointments. This information is interesting to our readers.*

H. P. GORDON is in Idaho.

MORTON WEBBER is at Salt Lake City.

H. F. A. RIEBLING is at Gold Basin near Chloride, Arizona.

J. B. TYRRELL is examining mining property in Newfoundland.

WARD ROYCE is Captain of Engineers at Fort Leavenworth, Kansas.

FRED. SEARLS, JR., is in service with the Engineer Corps in France.

HARRY H. HANNAH has moved from Los Angeles to Lida, Nevada.

COURTENAY DE KALB is at Bisbee, after a visit to the El Paso smelter.

L. WEBSTER WICKES has moved from Los Angeles to Landore, Idaho.

M. C. DRAKE is at the Officers Training Camp at Fort Sheridan, Illinois.

ROY KING has returned to California, after spending four years in Colorado.

ELLSWORTH H. SHRIVER is Lieutenant in the 23rd Engineers at Camp Nevada, Maryland.

LAWRENCE COMAN is in the New National Army as a private at Ft. Leavenworth, Kansas.

H. H. BURHANS is First Lieutenant with the 316th Engineers at Camp Lewis, Washington.

STUART RAWLINGS is now assistant manager for the Cerro de Pasco Mining Co., in Peru.

FALCON JOSLIN has returned to Fairbanks, Alaska, after a visit to New York and Washington.

MORTIMER NORTH is Lieutenant of Engineers and is raising a company of miners to go to France.

T. C. ROBERTS, engineer to the United Verde mine, at Jerome, is in New York on his way to South America.

JOHN BALLOT, chairman of Minerals Separation Ltd., has returned to New York from Houghton, Michigan.

NORMAN D. LINDSLEY is First Lieutenant in the Engineer Officers Reserve Corps at Ft. Leavenworth, Kansas.

THOMAS M. SMITHER is First Lieutenant in the Engineer Officers Reserve Corps at Fort Leavenworth, Kansas.

FAYETTE A. JONES, formerly president of the New Mexico School of Mines, has returned from Alaska to Albuquerque.

HORACE V. WINCHELL passed through San Francisco on his return from Japan, where he examined the Ashio copper mine.

JOHN G. KIRCHEN, general manager for the Tonopah Extension Mining Co., has moved his headquarters to Reno, Nevada.

E. E. FREE has been given a commission as Captain in the Ordnance Department and has been detailed to inspect munitions.

G. R. DE BEQUE is Lieutenant in the Engineer Corps of the American Expeditionary Force and is now on his way to France.

HUGH MCNAIR, son of F. W. MCNAIR, president of the Michigan College of Mines, has been decorated in France for special bravery in the Ambulance Corps.

Harry S. Richards, First Lieutenant of Infantry, son of James Richards, superintendent of the Isle Royale mine, Houghton, is on his way to France for special duty.

J. E. SPURR has resigned as advising engineer to the Tonopah Mining Co., on the decision of the company to drop its exploration department, which has accomplished its object.

## Mineral Output of Nevada

The mine production of gold, silver, copper, lead, and recoverable zinc in Nevada in 1916 is given by the U. S. Geological Survey in the accompanying table. Nevada has made

steady progress in mineral production since the discovery of Tonopah. Nine counties in the State have an annual production of more than \$1,000,000 in value. The four most important are White Pine, Nye, Clark, and Esmeralda. Almost two-thirds of the ore-tonnage is derived from copper and the remainder from gold, silver, lead, and zinc mining.

MINERAL PRODUCTION OF NEVADA IN 1916  
(Advance figures by V. C. Heikes, U. S. Geological Survey)

County	Number of producers	Ore.	Gold. <sup>a</sup>	Silver <sup>a</sup>	Copper	Lead	Recoverable zinc content.	Total value.

<sup>b</sup> Average value of metals: Gold, \$20.6718 per ounce; silver, \$0.658 per ounce; copper, \$0.246 per pound; lead, \$0.069 per pound; zinc, \$0.134 per pound.

## Recent Decisions

### MINERS' LIENS—ALASKAN LAW CONSTRUED

Under the Act of the Alaskan legislature of April 30, 1913, a mine owner who leases his claim and fails to post non-responsibility notices or record the lease is liable to have his mine taken under foreclosure of the liens of miners and material-men employed by the lessee.

Spalding v. Martin (Alaska), 241 Federal, 372. April 9, 1917.

### OIL LEASE—FAILURE TO DRILL OFFSET WELLS

Where the lessor in an oil and gas lease sues the assignee of the lessee for damages resulting from his failure to drill wells and save the lessor's ground from being drained of oil through wells drilled in adjacent territory, he must prove the assignment and transfer of the lease, operations under the lease by the lessee, negligence in failing to offset wells driven on adjoining territory, and the actual damage in loss in royalties to the lessor resulting therefrom.

Steel v. American Oil Development Co. (West Virginia), 92 South-eastern, 410. April 17, 1917.

### OIL LEASE—EVIDENCE OF EXTENSION

When a mineral lease by its terms expires within a definite period unless oil or gas is discovered, in which event it is to

be extended so long as either can be produced in paying quantities, the fact that after the expiration of the period named the lessor executed a deed purporting to be subject to the lease, and the lease itself was assigned, constitutes no evidence, in an action for rent, of an extension of the life of the lease. Nor is the fact that such has not been released of record evidence of its still being in force; nor does its execution create a presumption of possession by the lessee.

Ashgrove Lime & Portland Cement Co. v. Chanute Brick & Tile Co. (Kansas), 164 Pacific, 1087. May 12, 1917.

### ACT OF 1866—SURFACE PATENTED LIMITS APEX

A patentee under the Act of 1866 is entitled only to so much of the vein or lode as apexes within the surface for which he has elected to apply for patent, even though if he had kept his location upon which the patent was based good through performance of annual labor he might have claimed under the location a greater length of vein with sufficient surface ground to work it. Although the Act of 1866 is indefinite as to the grant of surface ground and apex, the election of a locator under that Act of the amount of surface he will take in his patent delimits also the amount of apex he gets under that patent, and the patent is void as to any part of the apex attempted to be included which lies outside the limits of the selected surface.

Whildin v. Maryland Gold Quartz Mining Co. (California), 164 Pacific, 908. May 17, 1917.

# THE METAL MARKET

## METAL PRICES

San Francisco, September 18

Aluminum-dust (100-lb. lots), per lb.	\$1.00
Aluminum-dust (ton lots), per lb.	\$0.95
Antimony, cents per pound.	16.50
Antimony (wholesale), cents per lb.	14.75
Electrolytic copper, cents per pound.	28.50
Pig lead, cents per pound.	9.50
Platinum, soft and hard metal, respectively, per ounce.	\$105—111
Quicksilver, per flask of 75 lb.	\$115
Spelter, cents per pound.	10
Tin, cents per pound.	80
Zinc-dust, cents per pound.	20

## ORE PRICES

San Francisco, September 18

Antimony, 45% metal, per unit.	\$1.10
Chrom. 40% and over, free SiO <sub>2</sub> limit 8%, f.o.b. California	
per unit, according to grade.	\$0.60—0.75
Magnetite, crude, per ton.	\$8.00—10.00
Tungsten, 60% WO <sub>3</sub> , per unit.	\$23.00—28.00
Molybdenite, per unit for MoS <sub>2</sub> contained.	\$40.00—45.00
Manganese, Carnegie schedule less freight to Chicago. Less than 40% special quotation.	

Manganese prices and specifications, as per the quotations of the Carnegie Steel Co. schedule of prices per ton of 2240 lb. for domestic manganese ore delivered, freight prepaid, at Pittsburgh, Pa., or Chicago, Ill. For ore containing

	Per unit
Above 49% metallic manganese.	\$1.00
46 to 49% metallic manganese.	0.98
43 to 46% metallic manganese.	0.95
40 to 43% metallic manganese.	0.90

Prices are based on ore containing not more than 8% silica nor more than 0.2% phosphorus, and are subject to deductions as follows: (1) for each 1% in excess of 8% silica, a deduction of 15c. per ton, fractions in proportion; (2) for each 0.02% in excess of 0.2% phosphorus, a deduction of 2c. per unit of manganese per ton, fractions in proportion; (3) ore containing less than 40% manganese, or more than 12% silica, or 0.225% phosphorus, subject to acceptance or refusal at buyer's option; settlements based on analysis of sample dried at 212° F., the percentage of moisture in the sample as taken to be deducted from the weight. Prices are subject to change without notice unless specially agreed upon.

## EASTERN METAL MARKET

(By wire from New York)

September 18.—Copper is quiet and nominal, remaining at 26.25c. all week. Lead is dull and weaker, ranging from 9.87 to 8.87c. Zinc is steady and quiet at 8.25 to 8.37c. Platinum remains unchanged at \$105 for soft metal and \$111 for hard.

## SILVER

Oct.	17.90 28.50
Nov.	18.88 31.95
Dec.	20.07 32.89

The following dividends have been declared: Nevada Consolidated, \$1 per share; Ray Consolidated, \$1; Chino Copper Co., \$2.50; Butte & Superior, \$1.25; and Utah Copper Co., \$3.50 per share.

Anaconda's production last month of 11,175,000 lb. was the smallest in four years. The properties had been operating at 33 1/3% capacity through July and greater part of August. Washoe smelter closed August 25, following a walk-out of the men. Great Falls refinery followed, and the mines shut-down, so that activity of the company in Montana has practically ceased.

Exports of copper for the fiscal year ended in June amounted to 1,021,501,398 lb., as against 711,342,146 in 1916. Exports of zinc were 504,294,665 lb., as against only 4,560,000 lb. in the year ended just before the War began.

It is announced that the sale of copper to the Allies in August amounted to 77 million pounds at 25c. per pound.

## ANTIMONY

The ore seems to be a little lower at from \$1.70 to \$2 per unit for the best material.

## MOLYBDENUM

Concentrate continues unchanged at \$2.10 to \$2.20 per lb. of contained MoS<sub>2</sub>. Not much material is being offered here.

## MANGANESE

As high as \$1.25 to \$1.30 per unit, seaboard, has recently been paid for high-grade (40-50% Mn) ore from India. This is a record price to date.

# Eastern Metal Market

New York, September 12.

A better feeling generally pervades the metal markets. There has been more inquiry in some cases than in weeks, particularly for copper and zinc. The prospect of an early settlement of the copper controversy is having a stimulating influence on the market. In the absence of large buying many quotations are still nominal.

Copper is firmer but nominal.

Tin is steadier and higher.

Lead is in poor demand and lower.

Zinc is more active but unchanged.

Antimony continues lifeless.

Aluminum is quiet and no stronger.

Government purchases make up the greater part of the current business the last week in the steel market. Other consumers seem to believe that the market will continue to decline and are in no hurry to buy. Any readjustment of iron and steel prices is very slow and the situation in which the Government finds itself is more complicated if anything. It is significant that representatives of some of the Entente Allies are again negotiating actively on their own behalf and independently, at least temporarily, of the War Industries Board. Sales of re-sale pig-iron are more frequent, due possibly to unconfirmed rumors that Government prices on pig-iron are to be lower.

## COPPER

It is at last possible to report a better tone to the copper market after three or more months of dullness and stagnation. The principal cause for this is the official announcement of the purchase by the authorities at Washington of 76,654,000 lb. of copper for the Allies at a price understood to be 25c. per lb. This means an expenditure of nearly \$2,000,000. There remains yet to be decided the price and the requirements of our own Government. Negotiations looking to a decision of this point are now active at Washington and a decision is expected today. It is hoped by some, that the same price will be decided upon, but it will not be surprising if 20 or 22.50c. per lb. is fixed. It is certain, however, that a decision of this long drawn out matter will be of incalculable benefit to copper and the non-ferrous metals in general. There has already appeared in the trade a more active inquiry in the last few days, a direct result of the allied purchase. Domestic consumers are on the look-out and ready to cover their accumulated needs just as soon as a price level seems assured. Actual sales have so far been few, or almost negligible, despite rumors of large domestic buying. Quotations have certainly stiffened but they are still quite nominal. Yesterday both Lake and electrolytic were quoted at 26.25c., New York, for early delivery with last quarter firm at 25.50 to 26c. Without doubt better days are ahead for the copper market and an active market is felt by many to be not far distant. The London market continues unchanged at £137 for spot electrolytic and £133 for futures.

## TIN

The market last week, after our letter was written, continued nominal and stagnant. There were more sellers than buyers. On Friday a little better tone developed with inquiries appearing for lots of 20 to 25 tons, but no sales were reported. This week thus far the market has shown more life. On Monday, while quiet, there developed a better tone, aided to some extent by fair sales of small volume. Yesterday, Tuesday, demand was still better, moderate sales being recorded aggregating 125 to 150 tons. The prospects are that this better

feeling will continue and the trade will not be surprised if the tin market picks up after a long dullness. Arrivals to September 11 inclusive have been 700 tons with 5400 tons reported afloat. The London market has declined 10s. per ton in the past week and now stands at £243 for spot Straits.

## LEAD

The American Smelting & Refining Co. has again contributed the feature to a more or less lifeless market. It repeated on Wednesday last what it did the week before—lowered its quotations \$10 per ton or ½c. per lb. to 10c., New York. Two such recessions in two weeks are not of a nature to stabilize a market. There appears to be a decided lack of confidence which pervades the entire situation. There is an indication that consumption of manufactured goods is falling off. Sellers lack initiative and fear to press the market, realizing that such pressure will only accelerate the decline. The entire tone is lower and new inquiry is absent. This was the status at the close of last week. Since then the markets, particularly the outside ones, have declined and free offers have been made at 9.50c., St. Louis. This is reported to have resulted in a fair business. There are hints of fresh inquiries from Canada. With 8c. per lb. still in the minds of purchasers as the Government price, continued hesitation is to be expected, supported as it is by the conditions here related.

## ZINC

Sentiment is decidedly better and it is believed that the market has recently touched bottom in the stagnant weeks of the immediate past. A turn for the better is believed to be at hand or at least to have started. This is based on the manifest increase in inquiry in the last week. Dealers report that in the week ended Saturday there was more inquiry and more business done than in many weeks and that so far this week, two days, inquiry largely exceeded anything in several months. It must be acknowledged, however, that the sales referred to have not been of large enough volume to greatly affect quotations which yesterday were 8c., St. Louis, or 8.25c., New York, for early delivery. For future delivery, or last quarter, about ½ to ¾c. above these prices is asked, but commitments beyond October are not eagerly entered into. The apparent cleaning up of at least part of the copper situation, referred to in this letter, is also a stimulating market influence in zinc. The fact also should not be lost sight of that production has been cut down from 30 to 40% in the entire country owing to some producers being obliged to operate at a loss under present price and labor conditions. 'Under the rule' on the New York Metal Exchange there was sold last week 200 tons of prime Western at 7.50c. in bond and 300 tons at 7.80c. in warehouse, New York, for immediate delivery.

## ANTIMONY

There seems to be but little demand for antimony and Chinese and Japanese grades are quoted at 14.50 to 14.75c. per lb., New York, duty paid.

## ALUMINUM

The market is dull with No. 1 virgin metal, 98 to 99% pure, quoted at 46 to 48c. per lb., New York.

## TUNGSTEN

Prices continue to range from \$23 to \$25 per unit for tungsten ores with \$26 asked for some high-grade ores. A fair amount of business is reported. Ferro-tungsten is a little stiffer with a minimum of \$2.50 and up to \$2.80 asked. Demand continues good from all sources.

# INDUSTRIAL PROGRESS

## RICHARDS JIGS ON TUNGSTEN ORE

The performance of Richards jigs at the Wolf Tongue Mining Co., Nederland, Colorado, has been described by C. A. De Welt, mill superintendent at that property. It is significant to note that the material treated on the jigs ranges all the way from +10 to -200 mesh and that 50% of the material is -200 mesh. Those familiar with the milling of tungsten ore will realize the difficulties encountered in the treatment of the -200-mesh product. The present practice at the Wolf Tongue, in addition to being a record in jig operation, has apparently

arrangement a large proportion of the concentrate is obtained here and the loss of concentration is reduced by 10%.

The first jig purchased was of the old type, which made but one concentrate, the hutch product. By careful investigation, suggestions were made whereby an improved type, making three different products, was developed. The hutch product ran over 60% WO<sub>3</sub>, and the side and end-draws over 50% WO<sub>3</sub>. A two-unit set has been installed, so arranged as to run the feed over the first, dewater, and then over the second. A good grade of concentrate is obtained from the second jig. Three concentrate products are obtained from the first jig and two from the second.

Since ores of +10 mesh to the product of the ball-mill, 50% of which will pass 200 mesh, are treated on the Richards jigs, the wide range of material treated is apparent. The cost of operation and repairs is negligible, and the jigs require less water per ton of ore than any other jig. The action is entirely automatic, and the results of the installation have surpassed the company's estimates by a good margin. It is De Welt's belief that jigs can be so installed as to do away with from 25 to 50% table work. The Richards jigs were supplied by the Denver Engineering Works Co., Denver, Colorado.

The illustration shows a double-unit Richards pulsator jig, 12 by 12-in. screen compartment. Two jigs are in series with a dewatering box between. Each unit is equipped with a separate pulsator valve, oscillating pan for coarse-concentrate discharge, air-chamber, water-gate valve, side and hutch gates for the discharge of the concentrate.

THE ILLUSTRATION SHOWS A DOUBLE-UNIT RICHARDS PULSATOR JIG.

DOUBLE-UNIT RICHARDS PULSATOR JIG

solved this hitherto perplexing problem, and has resulted in a decidedly increased efficiency in the entire milling operation. The Richards jigs have subsequently been installed at a number of other tungsten mills. Before putting in Richards jigs, experiments were conducted with them over a period of four months and several refinements were made in their construction. When installed, De Welt reports, "we were repaid for all expense in less than thirty days."

On ores of about the same grade, classification before jigging is unnecessary; but where all grades of ore are mixed, as at the Wolf Tongue, better results are obtained by classification. The proper arrangement is to put +100 mesh over one jig and -100 mesh over another. In milling tungsten ores, classification is most important and with this division of the product, the results have been splendid. The arrangement is to run the product from the battery and ball-mill over Richards jigs before it goes over the tables, by which

## TAPPING A LAKE FOR WATER-POWER

\*In the summer of 1915 the Alaska Gastineau Mining Co. drove a tunnel 1400 ft. long to tap the waters of Annex Creek lake and thus obtain water-power for its 4000-hp. power-plant on the sea beach, two miles distant, at a point 17 miles from Juneau. This work embodies some unusual and interesting features, due to the fact that the lake-end of the tunnel was 150 ft. below the water-level.

The tunnel proper was approximately 1400 ft. long, but included a raise for safety purposes and other station work amounting to approximately 1700 ft. of driving. The tunnel was driven 8 by 8 ft. with an arched top, making it 9 ft. high. The ground encountered was hard coarse-grained granite that gave considerable difficulty in breaking. Some 22 to 23 holes per round were required, and the tunnel included nine 9-ft. cut holes, the remainder being 6 ft. deep.

Four Sullivan 'DR-6' water-hammer drills were purchased for the tunnel work, two being held in reserve and two mounted on a cross-bar. These drills put in rounds with 1½-in. round hollow steel in an average of 4½ to 5 hours' work. This was considered fast drilling for the ground encountered. The average footage per month was 400. Good blacksmith work kept the steel breakage very low. In addition to the 'DR-6' drills, one Sullivan 'DA-21' stoper was used for trimming up roof and other odd jobs, and a Sullivan 'DP-33' rotator-hammer drill was also used in the open to cut a trench for the water-pipe from the mouth of the tunnel to the power-

\*An article by B. B. Brewster in 'Mine and Quarry.'

plant on the beach. Considerable difficulty was encountered in shoveling, owing to the character of the shattered granite, which formed a material resembling concrete in texture.

When the tunnel had reached a distance of 1350 ft. from the portal, some doubt arose as to the character of the ground ahead, and a Sullivan 'Beauty' diamond-drill was installed. With this, at points three feet on either side of the station, three holes were drilled with the 'Beauty' drill, at nearly right angles to the course of the tunnel. These were driven so as to come out as nearly as possible at the bottom, at the top and a little above the proposed tunnel line so as to give exact information as to the ground condition at the point of entering the lake. The holes bored encountered mud and ooze, showing that some other point would have to be selected for the final break-through. The distance to the water was here about 50 feet.

A diamond-drill hole almost in line with the axis of the original tunnel was then bored 36 ft. to the lake. This hole showed solid granite at the edge of the lake. An offset to the left was then taken and the tunnel continued and another station was cut, and six holes driven with the diamond-drill to the water. These holes showed that the water was about 36 ft. from the station and solid granite was encountered all the way. All the diamond-drill holes were plugged with pipe and controlled by valves so as to prevent water and ooze from entering the tunnel. The driving was then continued until the tunnel breast was six feet from the lake wall.

The task of removing this last six feet of pillar rock with a pressure behind it due to a depth of 150 ft. of water, was accomplished successfully and safely in the following manner:

A pocket was cut on each side of the tunnel for the full height. From each of these pockets two holes were driven with the regular Sullivan 'DR-6' drills, one of the holes being near the top and one near the bottom in each pocket. These holes were driven through into the lake and thus gave the approximate distance from the tunnel face to the water of the lake at each corner of the tunnel. In order to control the flow of water from these holes when the drills should break through into the lake, an extra large starting-steel was used and a nipple was driven into the hole made by this steel and cemented into place; then a valve was fitted in this nipple. All the other drills used were of the ordinary size and were passed from the machine through the valve and to the rock beyond, and the remainder of the hole drilled in this manner. When the steel broke through into the lake, a mark was made on it where it entered the valve, the steel withdrawn from the hole, the valve closed, and the water shut out. Then by measuring the distance between the mark made on the drill at the valve and the drill-bit, the distance to the water was obtained.

This method was used on each of the four pilot holes and thus a good idea of the profile of the rock on the side next to the lake was secured. Eighty-four holes were then drilled in the face with the regular machine drills. These holes were drilled to what was estimated to be 12 in. from the water. By this time the tunnel face was making a great deal of water, which was to be expected when it is taken into consideration that 84 holes had been drilled to within 12 in. of the water, which at this point had a vertical height of 150 ft., thus exerting no small pressure. The holes were spaced about 8 in. apart. Nine of them were very wet and were not loaded. The other 75 were loaded with 750 lb. of 40% Dupont gelatine. The dynamite was tamped into the holes to within 12 in. of the collar and then the remainder of the hole was tamped solidly with fire-clay.

Dupont No. 6 electric blasting-caps were used to detonate the dynamite. All caps, wires, and connections were waterproofed. Each cap was tested with a galvanometer before being taken into the tunnel and the circuit was again tested after the connections had been made. The wires strung from the roof and used for the lighting system during the driving of the tunnel were repaired, tested, and used for lead wires.

The tunnel made a turn about 50 ft. back from the heading and a bulkhead of fine material from the face was built up here, entirely blocking the tunnel. A similar bulkhead was constructed about 300 ft. nearer to the portal.

After all connections were made and tested, the bulkheads built, etc., the outlet valves at the portal were closed and water turned into the tunnel from the outside. The tunnel was allowed to fill until the meter showed that sufficient water had entered to fill the tunnel to the bulkhead nearest the portal. A pressure-gauge was then connected with the water in the tunnel and the shot was fired on February 4, 1916. At the moment of explosion the pressure-gauge only registered an added pressure of 10 lb., but the concussion was strong enough to shake the snow off the trees several hundred feet away. The head-gates were then opened and the water allowed to run through the waste-gate until the tunnel had cleared itself, when the water was turned into the pipe-line and proceeded to generate electric power at the beach a couple of miles away.

So far as known this is the first time that a project of this kind has been attempted with the tunnel lining completed and the head-gates in place at the time of firing the final blast to tap the body of water forming the supply.

The work was under the personal direction of H. L. Wollenberg, chief engineer for the Alaska Gastineau Mining Co. and his assistant, J. A. Wilcox, assisted by Byron Olson and Martin Donnelley.

## ROCKING FIFTH WHEEL IN SEMI-TRAILERS

A statement recently prepared by Lieut.-Col. Chauncey B. Baker, of the Quartermaster Corps, U. S. Army, and distributed to the railroads of the country by the Committee on National Defense of the American Railway Association, says that to move one field army of 80,000 men requires a total of 6229 cars, including passenger, baggage, box, stock, and flat cars, made up in 366 trains, with as many locomotives. When it becomes a matter of moving an army of 500,000 or 1,000,000 men, the equipment required is almost overwhelming in its magnitude. The foregoing figures are for the army alone, that is, the men, animals, vehicles, and guns; when it comes to moving the ammunition and food supplies for the army, the requirement for railroad equipment becomes enormous. Naturally, Government business must have the right of way, and commercial traffic will be held up. For some time business men have been growling about the congestion of freight. When the armies begin to move, or before they begin to move, some effectual means for relieving the situation must be found if business is to continue anywhere near normal. It will not be enough for commercial houses to anticipate their needs and to buy supplies as far in advance as possible; it will not be enough to avoid wasting car-space by loading all cars to maximum capacity; some new means of transportation, especially for short hauls, must be found. The logical method of relieving this situation is to empty the tractor semi-trailer system of hauling. Any motor-truck equipped with a Martin rocking fifth wheel can haul on a semi-trailer two or three times its rated carrying capacity, without overtaxing the mechanism of the truck. The time saved in transportation, and the enormously increased efficiency of the truck, more than make up for the slightly higher cost. Furthermore, the orders saved through the ability to make prompt and sure delivery soon pay for the initial cost of the new equipment required. The adoption of this method of transportation will help the Government, will help relieve freight-congestion, and expedite long-distance shipments, and will make business easier.

A. T. Krogn and F. A. Buckingham have joined the Lubricating Oil Department of the STANDARD OIL Co. and will give their attention to flotation oils.

## Building Bigger Business by Better Methods

*G-E Equipment is reliable and economical*

**W**HEN you cut down manufacturing costs—up go your profits. When you increase your production—when you increase the quality of your products—when you decrease spoilage—up go your profits.

When you make it easier for an employee to produce more, you make it easier for him to *earn* more; and you find it easier to get the *better kind* of help and much easier to *keep* them. And up go your profits.

When you cut down your power costs, when you cut down maintenance of plant—when you reduce

overhead supervision—when you lessen breakage of machinery—when you reduce stoppage of machinery—these mean *more profits*.

These advantages and a greatly increased capacity for service to your customers come to plants equipped with G-E Motor Drive.

We will gladly send a member of our Engineering Organization who will study the requirements and conditions of your plant, and tell you how, where and why G-E Motor Drive will give you manufacturing advantages.

Sales Offices in all large cities

# EDITORIAL

A World's Series of base-ball games sounds pathetically ridiculous in these times. It will sound like an insult a few months hence.

SOLDIERS are proverbially sparing of words. Great soldiers are laconic. When General Pershing placed his wreath at the foot of Lafayette's tomb, he said simply: *Lafayette, nous voilà!* Thus the historic debt is to be paid. "Here we are, Lafayette!"

FIXING of prices for steel and iron, involving a reduction ranging from 43 to 70% for various products, is an epochal event; it is fraught with tremendous consequences both now and for the future of industry in this country. Incidentally it should prove a great boon to the manufacturers of machinery.

RUBLES are down to 12 cents as compared with a normal parity of 50 cents. The Mexican dollar is worth more dead than alive. The mark is not quoted. Exports of gold are under embargo. Silver is nearing \$1.10 per ounce. The new Liberty bonds will be offered next month. Are you saving your money to invest in the second issue of the Liberty Loan?

MOLYBDENUM has proved a great help to the 75-mm. gun of the French army. This wonderful field-gun is lined with steel containing 9 to 10% molybdenum. It is reported that 2500 shots can be fired before re-lining becomes necessary. Molybdenum steel is also used most successfully in the trench-helmet, which is light and shrapnel-resisting, although useless against the rifle-bullet.

THE statistics of gold production in China for 1915 have been given officially. They are belated, but none the less welcome. The production was 200,000 ounces, of which 120,000 is credited to Manchuria, 60,000 ounces to Outer Mongolia, and the remainder to the provinces of Chihli, Hunan, Shantung, Kansu, Turkestan, Szechuan, Tunnan, Kiangsi, and Honan. It is interesting to compare this total of 200,000 ounces with the estimates published by various statisticians: the 'Mineral Industry' says 177,744 ounces; the 'Mining Magazine' says £755,000, or 182,500 ounces; while the 'Engineering & Mining Journal' credits China "and

others" with \$3,675,000, say, 183,750 ounces. These guesses were not at all bad.

IMMIGRATION records for the fiscal year ending June 30 show that 295,403 aliens entered this country and 66,277 departed, the net gain being 229,126 as against a net gain of 915,142 in 1914. It is interesting to note that the foreign countries making an increased contribution to our population last year as compared with 1914 were France, Spain, Portugal, and Mexico. In 1914 there came 251,612 immigrants from southern Italy; last year only 35,154. Similarly 138,051 Hebrews and 122,657 Poles came in 1914, as against 17,342 and 3109 respectively last year. The German immigration declined from 79,871 to 9682 during these two years.

TUNGSTEN is fairly steady in price. It is believed in well-informed quarters that a quotation of about \$20 will be maintained even when the War ends, owing to the demand for railroad work in Europe, the tungsten-steel being used for punching rails before attaching the fish-plates and, of course, in all sorts of high-speed tools. The dumps of 1 to 2% tungstic acid that were exploited when the boom began are now depleted, as are also other surficial deposits of tungsten ores. The cost of production has increased so that no quick return to a pre-war price is at all likely. At present the production in this country is about 5000 tons and the importation 4000 tons, the imports being nearly equal to the exports of ferro-tungsten and tungsten powder, so that the production just takes care of the domestic consumption.

COMMISSIONS from Russia are plentiful. Such work is agreeable at this time. We hope that their efforts will be successful in stimulating American interest in Russian trade and industry, but it will all go for naught until order is restored and property rendered secure. The I. W. W. element is too prominent just now to warrant anybody engaging in new business in Russia. Alexander F. Kerensky is a sincere patriot, we do not doubt, but he is too much of a visionary and a talker to re-integrate the uneducated millions left suddenly without a recognized leader. A democracy is not made in a day. China and Mexico afford unfortunate examples of the

disorder following the destruction of despotism and bureaucracy. If Mr. Kerensky is supported by the best of the military element he may succeed, but before order is established some of the forms of democracy must be dropped temporarily.

WE are asked to state that a fund is being raised to assist British and Canadians in California enlisting for service at the front. The allowance made by the British government is insufficient and it is desired to help the wives and mothers of soldiers by making a grant of \$10 to \$30 per month. Twelve hundred such men have volunteered for service from California and are now with the British army in France. It is hoped that some of our British and Canadian mining friends, unable to engage in active service, will contribute to this useful fund. Subscriptions should be sent to Mr. John Bishop, at 433 California street, San Francisco.

A LITTLE bird in Montana brought us the following story. It was a bird of the most voracious—not voracious—type. A new kind of concentrating table had been tested in the mill, and this table had yielded a tailing so poor in copper that everybody was delighted, especially the inventor, Mr. Emil Deister. Just then Mr. John Ballot, chairman of Minerals Separation, enters on the left, as they say in the play-book. He is surprised to learn that water-concentration can do as well as froth-flotation, on this particular ore at least. Whereupon he says to Mr. Deister: "Why are you so foolish as to sell your machine outright? Why don't you put it out on a royalty?" "No, thank you," says Mr. Deister, "I am quite content to make a decent profit and retain the goodwill of my customers, rather than harvest a crop of lawsuits." And when the little bird said that he cocked his eye in a knowing way.

ANNOUNCEMENT is made that the exploration department of the Tonopah Mining Company is to be discontinued and the energies of the management are to be concentrated on the development of the mining properties acquired through the exploration department during recent years. It is stated that Mr. J. E. Spurr, the distinguished economic geologist, has resigned as advisory engineer, having accomplished the purpose for which his services were retained. He has done well for the Tonopah company. In five years the total expenses of his department were \$261,108, and during that time "the net value of the results" was \$7,858,601. Apparently this means that successful business to that amount was transacted by acquiring properties or purchasing stock in operating companies.

IN the article describing mining methods in the Inspiration mine it is stated that technical men, that is, graduates from mining schools, are employed to supervise the tapping of chutes. This is a sign of the times. As hand-labor is decreased, giving way to automatic devices, the proportion of unskilled labor diminishes and the value of scientific supervision appreciates. These

methods of mining, in which nature is called upon to assist so largely as to reduce human effort to the mere removal of the ore shattered by gravity, place a premium upon intelligence and thus afford increasing opportunities for the services of technical men. Brain becomes more essential than muscle.

ON another page we comment on Judge Bourquin's decision in the Butte & Superior suit. We are glad to see that our contemporary in New York finds reason for concluding that the Court has not "viewed the case in the light of common sense." Hitherto our contemporary has shown no proper appreciation of the exacting nature of the demands made by Minerals Separation; now it uses "hoggishness" to describe the demands of the patent-exploiting company. It is well that the New York paper should have awakened, even tardily, to a realization of the real position of affairs, so menacing to the welfare of the mining industry. Here we may record the fact that the District Court at Butte, on September 17, ordered the Butte & Superior company to give bond for \$10,000 to cover the cost of appeal. A stay of injunction was granted for 30 days and thereafter until final determination on appeal, provided the defendant filed a bond for \$2,500,000 and either paid into court all the profit made each month on all material milled and treated by the process or filed a satisfactory bond each month to secure such amount. The case should be heard on appeal in San Francisco before the close of this year.

COPPER has been priced by the Government at 23½ cents f.o.b. New York, this price being subject to revision four months hence. The War Industries Board, in whose hands the matter lies, has stipulated that the producers shall not reduce the wages now being paid, they shall sell their copper to the Allies and to the public at the price now fixed by the Government, and they shall follow the directions of the Board for the distribution of the metal, with a view to preventing it from falling into the hands of mere speculators, and finally that the producers shall pledge themselves to maintain production "at the maximum so long as the War lasts." The Board acknowledges the "admirable spirit" shown by the producers in giving information and in meeting the wishes of the Government. At the same time the point is made that the high price of 36 cents attained by copper would have been exceeded by this time if the Government had not taken the matter in hand. We believe this to be true and we believe that the regulation of the price at a reasonable figure is to the best interests of the copper-mining industry. A warning is sounded that any mining company failing "to conform to the agreement and price" may be disciplined by having its mine and plant taken over by representatives of the Government and having them operated on the National account. No figures of cost have been disclosed. It is probable that the information recently gathered on the subject will be kept by the Government officials to guide them in the fixing of prices from time to time. The publication of

any attempted average would only excite undesirable controversy. The announcement of the price at 23½ cents has given satisfaction on Wall Street and it will, we believe, meet with general approval, as being just and expedient.

IN our issue of July 7 we published some notes concerning submarines and their capabilities. We are glad to know that the American Committee of Engineers in London re-published them in pamphlet form for the use of those interested in devising ways of circumventing the assassins of the sea. In this issue we reproduce a further bulletin prepared by the Naval Consulting Board. We commend the information to our readers. If any of them have good ideas on the subject they should address themselves to the Secretary of the Board, Mr. Thomas Robins, at 13 Park Row, New York. Since we last wrote on the subject nothing else that is important has been made known, at least nothing authentic. The most promising was the unofficial statement that listening devices have been developed to the point where the presence of a submarine at a distance can be detected sufficiently accurately to assist the chase by destroyers and other useful craft. On September 18 a wild story came from Washington announcing that Mr. Thomas A. Edison had invented a means of deflecting the course of a torpedo so as to render it innocuous, but this was denied promptly both at Mr. Edison's laboratory and by the Naval Department; yet, although the yarn was punctured promptly, it was used by one of our local organs of misinformation as the subject of an editorial expatiating upon the wonderful discovery. Country papers will reproduce the misleading comment of this careless scribe and another myth will be added to the many created by the reckless purveyors of news.

## Sampling Large Low-Grade Orebodies

For the sake of reference we stick to the above heading, under which an interesting technical discussion was started and has been continued with a good deal of spirit. In this issue we publish another contribution from Mr. Morton Webber, who, in reply to friendly comment, lays emphasis on the employment of the mill, not to sample ore in the mine, but to ascertain the factor of error in ordinary mill-sampling. The object of sampling is to ascertain the yield to be obtained when the mine is exploited on a large scale. This ordinary sampling often fails to do, as every engineer, from the youngest to the oldest, is likely to learn to his cost at some time or other, be he ever so careful and skillful. The reason for the failure is due to an unknown and variable factor of error. Likewise the mill-test by itself has failed to be an unerring guide. At best the ordinary mill-test served as a sequel to the hand-sampling and only confirmed the estimate applicable to a particular and small part of the mine. Now comes Mr. Webber with the excellent suggestion to use the mill-test as a means of determining the

sampling-error, which when known can be used at once to correct the results obtained by moiling. We commend his idea and hope that members of the profession will give it serious consideration—also criticism. Commonly the mill-test is used either as a sampling method or as a metallurgical investigation. For the moment we disregard both these functions and concentrate our attention on a new use of the mill. When it is used for the purpose of checking the sampling of various blocks of ore it does not matter whether the recovery, or the extraction as the case may be, is complete or not, all that is needed is to ascertain accurately the valuable content of the tonnage treated. To obtain this it is not necessary to ensure high metallurgic efficiency but to ascertain closely the loss in the tailing, so that it may be added to the recovery, for the purpose of knowing precisely the assay-value of the mill-feed. This permits a choice of milling method and points to one in which the sampling of the tailing is likely to be least inaccurate. Therefore for a gold mine it is better to use a small cyanide mill than a stamp-battery. Here it may be suggested that actual milling is not necessary, merely a rock-breaker and rolls for the purpose of large-scale sampling, in other words, a small sampling-mill, not a metallurgical plant. The motto of the mine-valuer should be 'It is better to be sure than sorry.' We know by experience that too much care can hardly be devoted to the crucial operation of sampling. Mining has suffered in reputation, as a profitable business, more by errors of appraisal than by the interplay of depravity and gullibility contributory to scandalous performance in promotion. The disappointments at Juneau have been due, not to chicanery, but to an ineffectual attempt to ascertain the real gold contents of large masses of low-grade ore. Let us learn by that experience. As we have said more than once, the worst of all waste is the waste of experience. To prevent it we ought to pay close heed to honest blunders. Frank discussion helps to elicit the essential truth, on which all successful technical operations are based. We invite members of the profession to contribute further to this intensely practical discussion of a highly important subject. We are glad to print a letter from Mr. E. E. Chase, in which he draws attention to one fruitful source of error, namely, the insufficient reduction of samples before they are subjected to assay.

## The Butte Decision

In this issue we publish the complete text of the decision handed down by the District Court of Montana in the case of Minerals Separation against the Butte & Superior Mining Company. We delayed publication of this decision owing to errors appearing in the text as first printed; and it will be noted that even now the citations are incomplete. There seems little excuse for such imperfections, which, however, are more important to the lawyer than to the layman. To the latter the decision will seem to be poorly expressed, the language

of it turgid, the exposition of the physics of the process unconvincing, and the reasoning hardly worthy of the reputation of the Court, for Judge Bourquin is reputed in Montana to be not only an upright but an unusually clever man, despite the lack of a conventional education. The Court states that the ambiguity and obscurity characterizing the flotation process are due "to the inability then and now to know and explain all its laws and principles." This statement has not become less true since Judge Bourquin has added to the legal literature of the subject. The word 'all,' of course, is redundant. Scientific men will be unable to explain 'all' the laws and principles of any metallurgic process until the Greek kalends. If the patent explains clearly the *modus operandi*, as is insisted by the Court, why was the process not applied successfully in this country until seven years after the grant of patent? The "skilled operator" had to perform a great deal of experimental work, usually without the aid of the Minerals Separation people, before he could put the process to practical use in the mill; and where the Minerals Separation people did assist, the desired result has not always been hastened; sometimes it has been retarded. Note how they stated, as late as 1912, that certain ores of copper, particularly those containing chalcocite, were not amenable to flotation.

Judge Bourquin's decision turns, as was expected, on the definition of the so-called 'critical proportion,' the phrase expressing a supposed limitation to the quantity of oil efficacious in froth-flotation. By accepting this supposed limitation the Supreme Court was, we believe, misled into an erroneous inference. Judge Bourquin places his own interpretation on the dictum of the highest court; he argues that "small deviations from the predetermined amount," namely, the critical proportion of oil, are injurious to the operation of the process, and in saying so he sets aside the evidence of work done successfully with proportions of oil that make the use of 'critical' ridiculous. Yet he acknowledges that "the process can be fairly successfully operated with 1% or more of oil," insisting, however, that "the excess of oil is useless, wasteful, and harmful," and merely a means of escape from infringement. Is it wrong to try to escape from the liability for infringement and to use more than the proportion of oil said to be essential to the working of a patented process, when by using more oil one can prove that the patent has been granted on a claim that is untrue in fact? The Supreme Court sustained the patent because it is based on the use of a proportion of oil that is "critical and minute," and yet if it is proved by large mills treating thousands of tons daily that the proportion need be neither 'critical' nor 'minute,' it does not matter, says Judge Bourquin, even though the Supreme Court rejected the claims in the patent that failed to specify the proportion of oil more closely than by the phrase "a small quantity." Here we come to the most unsatisfactory part of the decision—one exhibiting a curious lack of logic. Judge Bourquin quotes the Supreme Court's decision, limiting

the patent to the use of "a fraction of 1%" of oil, and invalidating the claims in which this exact proportion is not specified; yet immediately after quoting this dictum he says: "It seems clear neither patent nor decision undertakes to say the process depends upon less than 1% of oil or is inoperative with 1% or more of oil." Elsewhere he remarks: "There is suspicion that with experiments, as with figures, can be done anything for or against, without impropriety in the operator." This jibe at the technical witnesses is out of place. Obviously there is impropriety, of the grossest kind and of a kind to be severely reprobated by a judge, in using experiments or figures with intent to deceive. But experiments and figures are not the worst implements of deception; to words is given an even greater scope for making confusion, as the Court is well aware. Referring again to the express limitation of the process to "a fraction of 1%" of oil by the Supreme Court, Judge Bourquin says: "With the later knowledge of this suit, it is doubted that such would be the decision now." We shall see in due time whether the District Court of Montana is correct in this interpretation. As regards the use of a particular kind of violent agitation, to which the Supreme Court confined patent 835,120, Judge Bourquin has a variant notion. He refuses to distinguish between "applied agitation," that is, "by beating air into the mass" with blade-impellers, and "self-agitation," such as is "set up by the air particles themselves in merely rising through the mass" of pulp. It is not necessary to comment on this phase of the process to anybody that has compared the working of a Minerals Separation machine with that of a Callow cell.

The decision is sweepingly in favor of Minerals Separation and in accord with the same judge's decision in the Hyde case—a decision reversed by the Appellate Court in San Francisco. Judge Bourquin asserts that "the great mass of new evidence herein is but cumulative of the Hyde suit." We have read the record in both suits and have found much that seemed different to an important degree. This latest decision of the courts is calculated further to undermine public confidence in the judicial interpretation of the patent law. Not only has it become manifest that it is against the community interest to grant the monopoly of a process to patentees themselves ignorant of the underlying principles of their supposed invention, and therefore undeserving of a blanket right to collect royalties from those that introduce vital improvements, but it is clear that contests over the validity of patents and the infringement of them should be tried by judges having special qualifications, such as a scientific training, including a thorough familiarity with the fundamental principles of chemistry, physics, and mechanics. If all such cases could be settled on questions of law, the need for scientific acumen would not arise, but it is obvious that in these flotation suits the judges are asked to swim in waters wherein heretofore some of them have not waded, in waters by which they have been scarcely wetted.

## Sampling Large Low-Grade Orebodies

The Editor:

Sir—If the sampling discussion has not closed I would like to suggest from my own experience that the spotty gold mine that “cannot be sampled,” or on which two engineers cannot agree as to value, owes its supposed character to the different methods of assayers in reducing the sample to a pulp. Let us assume that the hard-working conscientious engineer has followed the plan I always adopt, namely, maximum length of channel-cut, 5 feet; weight of sample, 50 lb. per 5 ft.; if wet or sticky, then thoroughly dried on canvas in the sun; then all crushed to pass a  $\frac{1}{4}$ -inch screen-opening. I carry a specially made sieve for this purpose, separating the fine so as not to exhaust energy on stuff already fine enough. Next, the ore is thoroughly mixed and cut down to a 2-lb. sample, most of which will be so fine as to pass a 20-mesh screen. Now—and here is the whole burden of my song—what does your assayer do with this two pounds over which you have spent an hour of human energy? Have you ever looked at his reject? I have, and my blood has curdled on occasions to find the reject looked no different from the original two pounds. I have even suspected at times that he simply spooned out half of an assay-ton. But the right kind of an assayer puts that whole two pounds through a 50 or an 80-mesh screen and I have proved absolutely that in no other way can a spotty gold ore be properly mixed or the two halves of a sample be made to check. There should be standardization among assayers or the whole careful sampling work of an engineer may be spoiled at the finish.

I am one that believes that almost any mine can be hand-sampled and results obtained on which an engineer will then know what to do or what to advise, provided the samples taken are large enough and near enough together and the assayer looks after his end of the business. But I did think I was up against it when I attempted to hand-sample the Ebner mine, in Alaska, a 40-ft. lode in which the highest gold-contents were distributed along parallel diagonal streaks. I tackled it, however, obtaining a \$2.18 average. A large mill-test from the same locality gave \$2.22. Was it careful work or merely a coincidence? I cannot say.

For the mines that really cannot be sampled, a good stock of common sense may be substituted. For instance, I was called upon to pass an opinion, after two weeks examination, on one of the big lead mines of south-eastern Missouri. Flat beds 40 ft. thick. A year's time

might have furnished some valuable data by sampling, but it would have also required the ‘human fly’ to do the work. I got around it by selecting a typical section, cleaning the face and taking samples of the different layers and at the same time fixing mentally in my mind the amount of ‘shine’ each layer afforded. Then, after the samples were assayed, I visited the place again and further rubbed into my mental vision the relation of ‘shine’ to assay-value, and found that I could carry this fairly well through the entire miles of workings. The Lake mine in Michigan was a harder one. All mass copper and no mill-runs available. The question to be solved was this: Was the general run of the mine a 2% or a 5% ore as claimed? No one can sample ‘mass’ copper, and I was baulked for a moment, but solved it pretty well by figuring that a 2% native-copper content meant a chunk nearly the size of a man's head for every ton broken. Then, by hanging around the stopes and drift-faces for a week, I found I could estimate the tonnage broken and the approximate visible copper, all of which was in large pieces.

Denver, September 5.

## Mill-Tests v. Hand-Sampling

The Editor:

Sir—I have read the appreciative criticism by E. P. Spalding of my article of July 28 on this subject. He requests that I furnish a detailed description of my suggested method of dividing a large orebody into mill-test zones with the object of ascertaining the zone-sampling error, the obtained error to be used as a corrective factor for hand-sampling. In answer to Mr. Spalding's principal question, “How can the mill-test be made representative,” I desire to say that in the examination of large ore deposits I do not consider a mill-test to be representative individually, but only as a link in a chain of mill-tests supplemented by corrected hand-sampling.

The origin of the discussion to which I was asked to contribute was the discrepancy on the ore of the Alaska Gastineau between the results of mill-tests and the outcome of subsequent full-sized operations. I have no knowledge of this particular case beyond what I have read; therefore I would not be justified in making suggestions as to how this property might have been sampled. I will, however, describe a method designed by me for the examination of a large low-grade gold deposit in Central America. This property was optioned by a

client who owned an operating gold property equipped with a mill. Part of this mill was devoted to sampling the property under option. The deposit was divided into zones with the object of making a mill-test of the ore of each zone. The mill-test was not intended to sample the ore of the zone as a whole; its use was solely to determine the sampling-error of the ore at the point subjected to mill-test. It was then intended to estimate the tonnage, grade, and continuity of the ore by hand-sampling to be corrected by the sampling-error factor for each zone as disclosed by a zone mill-test. The property proved undesirable when subjected to this method of examination and the option lapsed. This case may not fully illustrate the result of a 'combination method' with the subsequent large-scale stoping of full-sized operations. I believe, however, that had we been guided by either hand-sampling or mill-tests alone, very much more money would have been spent on the venture than was actually involved. In fact, the loss was very small considering the size of the project. The mill-test disclosed a sampling-error averaging about 40c. on an expected mill-head of \$3.50. This was roughly 40% of the expected operating profit.

In dealing with the principles involved in this example, I contend that a mill-test from a particular part of a large ore deposit will represent only the particular spot from which the ore has been removed. In the case of a low-grade simple-treatment gold ore, it is logical to assume that the sampling-errors obtained at numerous points of the area under examination will shade into each other more or less gradually. A reliable estimate can be made of the local sampling-error by obtaining the average of successive samplings of the stope-faces as the ore is removed for a mill-test and comparing this result with the recovery plus the tailing-loss. If, therefore, such mill-tests were made from various openings at pre-determined intervals over the supposed ore-reserves, it is logical to assume that the factor applied to the hand-sampling of the intervening spaces would constitute a reliable corrective and would reflect what should be expected when the intervening spaces (the ore-reserves) were mined. To facilitate explanation, I submit two diagrams in further response to Mr. Spalding and also to some other engineers who have requested a detailed scheme. Fig. 1 represents an area *A, B, C, D*, supposed to be an orebody of unknown grade under process of appraisal by the ordinary mill-test method, whereby a relatively large portion of ore obtained from a relatively small number of places is mined and treated. I submit that if the diamond-shaped areas in black are sufficient to determine the sampling-errors at these particular points of the mine, then continuing to mine and mill the shaded portions will not furnish further data on what should be expected in the area *E, F, H, G*.

Fig. 2 represents what I describe as a 'combination method,' whereby I use the mill-test solely as a *sampling-error indicator*, and I fall back on hand-sampling thus corrected to estimate tonnage, continuity, and grade. The area, *A, B, C, D*, is divided into eight mill-test zones

as shown, and the black diamond-shaped portions represent mill-tests of moderate size, whereby only sufficient ore is treated to disclose the sampling-error for each particular place. For example, in zone *A, E, K, O* an imaginary sampling-error of 10% is assumed to have been disclosed by the mill-test. The crosses indicate hand-sampling corrected by the zone-sampling error. I have gone into further details in zones *I, P, C, L*, and a similar refinement would be applied to the other zones. In the zone *I, J, M, L* there will be observed a dotted imaginary square, *R, S, U, T* and *H, W, Z, X* in zone *J, P, C, M*. The object of this is as follows: As the hand-sampling leaves the place where the mill-test was made in the zone *I, J, M, L* and approaches the mill-test for zone *J, P, C, M*, it is logical to assume that hand-sampling will reflect the influence of the other zone. Therefore, the sampling within the areas *R, S, U, T* will be corrected by a sampling-error of 10%, as shown in the diagram, but on passing the line *SU* it should then be corrected by a factor of 14%, this being the average of the two zones. As sampling passes the imaginary dotted line *HX*, a sampling-error of 18% should then be introduced. Further refinement in shading from one zone to the other could be interposed. I question, however, its utility under large-scale conditions.

To anticipate the criticism that an increase in the number of mill-tests entails increased trouble in cleaning-up and that there might be difficulty in forming accurate estimates because of the gold retained by the plates, it should be clearly understood that this method of sampling a large low-grade ore deposit is not intended as a metallurgical experiment; but purely as a 'combination method' of mine-sampling. In other words, the extraction obtained by the mill-test is unimportant. If amalgamation is used and the plates properly scraped after the clean-up, they should carry a uniform or suspended quantity of precious metal. This complication should therefore not be insurmountable. What is fundamental is the comparison between the successive sampling of the stope-faces with recovery plus tailing-loss. If 60% is recovered by the mill and 20% is known by careful assay to be retained in the tailing-pile, the unaccounted difference of 20% represents the sampling-error; which is the information wanted. When sufficient ore has been treated to obtain this factor, little will be gained by continuing to mine and mill more ore from this particular spot. I consider, however, that a small cyanide mill is better adapted to this method of combination sampling, in which the object is to determine the head, recovery, and tailing-loss without reference to metallurgical efficiency. As it is vital to sample the tailing accurately, as part of the calculation to obtain the sampling-error, the simplicity in sampling sand in leaching-vats will illustrate why I favor a small cyanide plant as a sampling-error indicator.

In order to make my suggested 'combination method' clear to some of the younger members of the profession, I take the liberty of summarizing as follows: In the majority of cases, in dealing with the sampling of large

FIG. 1

low-grade ore deposits, the estimation of ore-reserves must be based on hand-sampling. This can be corrected by a series of mill-tests employed for the sole purpose as a sampling-error indicator. Once this error is obtained for a given place, the mill-test should terminate. A fresh mill-test should be made elsewhere to obtain the sampling-error for another zone. In other words, the sampling-error, which is employed as a factor to correct hand-sampling for additional areas, should be based on mill-tests conducted within these areas. The size of each individual zone will depend on the nature of the ore. In this way it may be possible to divide any ore deposit into zones to be governed by the engineering expediency of the particular case. The principles of this 'combination method' will apply to best advantage in mines of fairly uniform mineral characteristics. The greater the

variation, the shorter must be the distance between one mill-test point and its neighbor, and the reverse. By 'mineral characteristics' I do not mean necessarily the assay of the ore in gold, but the proportion to gold content of friable base sulphides which so often constitute a carrying vehicle for the precious metal.

With regard to Mr. Spalding's further observations: the 'foot-weight' method should not be confused with the method of mine-sampling described above. In the Central American case the method is designed for the sampling of a large low-grade ore deposit, where it is of basal importance to attain the greatest accuracy. In the instance quoted an error of 40c. equalled 40% of the expected operating profit. The mill-test, as explained, in the estimation of a large low-grade deposit, is intended solely as a 'sampling-error indicator.' In my sampling

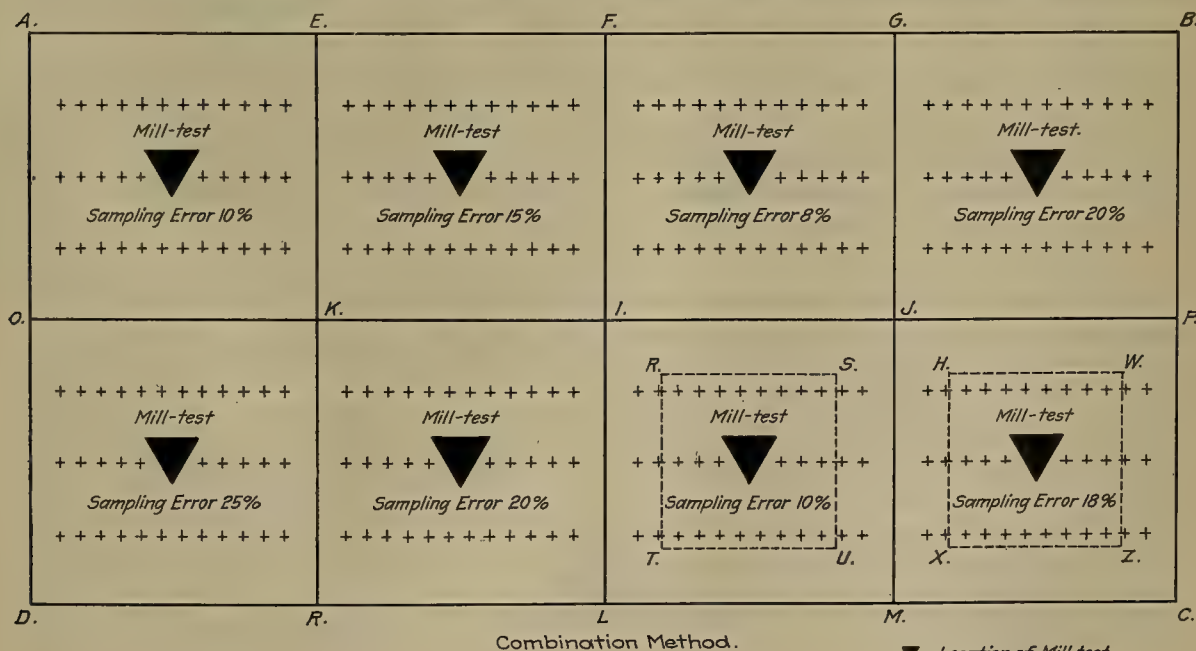

FIG. 2

▼ - Location of Mill-test.  
 + + + + Hand Sampling.

of the Red mine, to which Mr. Spalding refers, the use of a 'pre-determined foot-weight' of the stopes was designed for an entirely different purpose. In this case the mill-test was used not only as a device for ascertaining the sampling-error, but as a mine-sampler, and also as a metallurgical experiment. In order that the mill-test may perform these three functions, the test must be based on a representative, or 'composite,' shipment of the mine as a whole. Therefore, each stope should furnish its proportional weight, depending on its width and length. How this was accomplished in the case of the Red mine has been described in detail. It will be evident that such a method could not be applied to a large low-grade ore deposit owing to the doubt that would exist as to the intervening spaces. To apply the foot-weight system to such a deposit at a sufficiently short interval to avoid dangerous gaps would entail prohibitive expense.

MORTON WEBBER.

New York, September 11.

## Water and Mines in Paradise

The Editor:

Sir—On page 251 of your issue of August 18, there is a reference to the work of the Paradise Irrigation District and a statement that a clash has arisen between the farming and mining interests. It is also said that mining land absolutely useless for farming is included in the district and the owners have the privilege of paying tax without being allowed to have the water. The following is a correct statement of the matter.

It is true that the Irrigation District water will not be sold for mining purposes. The water is needed for bona-fide orchard development, and the people of the district are taxing themselves to obtain water for that purpose only. The mine-owners, who have made informal application to purchase water, have never had the use of this water in the past and are not in any way being deprived of any flow which they have heretofore used. The district, by constructing a large reservoir, will impound storm-water without interference with the legally established and existing rights to the perennial flow. It seems difficult to understand wherein the mining interests are being injured thereby.

Concerning the tax on mining land, there are two answers: First, the owners of all land have an opportunity to appear before the Board of Equalization each year and have the tax-rate adjusted in case their land is actually not susceptible to benefit from the irrigation system. None of the owners of the land referred to has so appeared at any time in the past, but all have paid the tax levied without protest. Certainly a technical journal is not the place to make such a protest when no protest has been made before the board charged by law with the duty of hearing such protest. Second, the land in question includes 20 acres which is susceptible to profitable orchard development, as stated before an officer of the district by the owner thereof. The tax levied

against this land is necessarily averaged over all land in the tract, although the valuation given on strictly mineral land is but \$1 per acre and the annual tax 2 to 4 cents thereon. •

To make the matter short, it is not true that the district is levying an unwarranted tax upon mining land, it is not true that the owners pay tax without being allowed to have the water, and it is not true that the mines are being deprived of water to which they have a right for mining use.

IVAN E. GOODNER.

Chief Engineer,

Paradise Irrigation District.

Paradise, Cal., August 27.

[The statement to which exception is taken was not made editorially but by our local correspondent at Paradise.—EDITOR.]

GEORGE A. BURRELL and Alfred W. Ganger of the U. S. Bureau of Mines state that the limits of complete inflammability of mixtures of combustible gases and air are:

	%
Gasoline vapor .....	1.5 to 6
Ethane .....	2.5 to 5
Methane .....	5.5 to 14.5
Natural gas .....	5 to 12
Acetylene .....	3 to 73
Artificial illuminating gas.....	7 to 21
Hydrogen .....	10 to 66
Carbon monoxide .....	15 to 73
Blast-furnace gas .....	36 to 65

In general the limits are slightly lower when ignition occurs from the bottom upward than when it occurs from the top downward.

THE National Board of Fire Underwriters publish the following rules for fire protection: (1) Learn the factory safety rules and observe them. (2) If you discover a fire, give the alarm promptly. Do you know how to do this? Ask to be shown. (3) Don't smoke where it is not permitted. (4) Never drop a lighted match, cigar, or cigarette; be sure that it has no spark left before throwing it away. (5) Report suspicious strangers seen about the plant. (6) If you notice any unusual smoke, the overheating of any machine, or any other accident, notify the foreman at once. (7) Carry your precautions into your own home; keep your house and yard free from rubbish, and help others to do the same. Where would your job be if this plant should burn?

THE relative importance of the principal metal-mining States can be estimated, in a general way only, by the weight in pounds of high explosives used in 1916:

Michigan .....	29,691,122	Nevada .....	7,378,443
Missouri .....	24,875,757	Washington .....	6,546,844
California .....	13,942,000	Alaska .....	5,761,280
Arizona .....	13,002,555	Utah .....	5,133,090
Minnesota .....	10,220,182	New Mexico.....	3,061,951
Montana .....	9,162,385	Oregon .....	2,578,689
Colorado .....	8,826,030	South Dakota.....	2,272,840

FIG. 17

## Miami: The Mining of the Ore—III

By T. A. RICKARD

Before selecting a method of mining for extraction of the 100,000,000 tons of low-grade ore estimated to be available in the Inspiration mine, it was decided to make a series of experiments.† For this purpose a box with glass sides was constructed, and in it was placed crushed ore capped by red waste, so as to be able to observe the effect of drawing ore through miniature chutes. From these experiments it was deduced that: (1) Chute-centres for drawing caved ore should be placed as near together as the ground will allow; (2) ore should be caved in columns of maximum height; (3) when cap-rock appears at the chutes, no more should be drawn unless the bottom slice is being mined. The method of caving finally selected was a modification of that introduced at the Ohio Copper Company's mine in Utah by Felix McDonald, who also supervised the introduction of the method in the Inspiration mine. As Mr. Lehman says, "the method consists, essentially, of under-cutting the ore (taking out a horizontal slice), allowing the ore above to cave and crush, and drawing off the crushed ore through small inclined raises, driven under the caved ore, into main inclined raises that lead down to the haulage-drift chutes." The various stages of the operation are illustrated in the accompanying diagrams, Fig. 14, 15, 16, and 17, taken from Mr. Lehman's excellent description.

After the shafts have been sunk, the haulage-levels are extended under the ore at intervals of 100 ft. Then inclined raises, at an angle of about 50°, are started at intervals of 25 ft., and chutes are built as soon as these are up to 10 to 15 ft. The raises are continued to the first sub-level, where sub-drifts, parallel to the haulage-level, are driven, intersecting the series of raises. These are then extended to the next sub-level, where again

another set of drifts is started to connect with the series of raises. See Fig. 14. These operations are continued until the first under-cut has to be made. This will be as far below the top of the ore as it is intended to start the caving. When all is ready, the sub-level drifts on the first under-cutting level are 50 ft. apart, as also on the

A CHALCOCITE ENRICHMENT IN SCHIST

sub-level immediately below, whereas on the lower sub-levels the drifts are 100 ft. apart. Each drift is connected with raises at intervals of 25 ft. Cross-drifts, at intervals of 150 ft., serve to complete the system of drifts on each sub-level.

The next step, before stoping begins, is to drive more sub-drifts on the under-cutting level, so as to have the drifts 25 ft. apart centre to centre. See Fig. 15. These last drifts meet branch-raises at 12½ or 25 ft. intervals as may seem necessary; they are called 'finger' raises and serve to tap the ground completely.

The under-cutting of the ore is started from a cross-

†'Ore-Drawing Tests, Etc'. By George R. Lehman. Trans. A. I. M. E., September, 1916.

drift on the boundary of the section to be mined. In retreating, as shown in Fig. 16, deep holes (8 to 10 ft.) are drilled into the pillars between. The broken ore is drawn through the finger-raises, in which ordinary board chutes are built 4 or 5 ft. below the sub-level, so that the blasting of the under-cutting holes will not destroy them. The ore may begin to cave as soon as it is under-cut, but in hard ground the caving may be postponed until the under-cutting has receded.

Then commences the withdrawal of the ore. Lumps too large for the chutes are blasted. The chute-tappers work in pairs. One climbs through the grizzly sub-raise, opens the chute-gate, and draws the ore, while the other pries the ore through the grizzly on the sub-raise below. From here the ore falls into the main raises and thence into the haulage-chutes, where it is loaded into 5-ton cars. Mr. Lehman, from whom I have borrowed the foregoing details, gives the cost of mining as 60 cents per ton, including a charge of 20c. for amortization of development expenditure.

The mining practice of the Inspiration is essentially a method of caving; it presents a near approach to underground excavation without the aid of either timber or powder. Only two feet, board measure, of timber, and only a quarter of a pound of explosive, is used per ton of ore. On the Joe Bush claim the ore reached to within 50 ft. of the surface, so that steam-shoveling was considered as a method of excavating, but the objection to it was the narrowness of the orebody and the fact that it was bounded on the north side by a steep hill. Thus, in order to uncover the ore it would have been necessary to remove too much of the hill that flanked the orebody. At the start an arbitrary depth of 35 ft.—the equivalent of a sub-level—was taken as the limit of caving; this interval was increased to 70 ft.; now, where opportunity offers, it is 200 ft., with confidence that it will prove practicable. Indeed, experience to date is such as to warrant the expectation of caving to a depth of 500 ft., in an orebody that had such a vertical thickness. In one section of the stopes 5% more copper than was estimated and 29% more tonnage were obtained, owing to dilution of the ore by admixture of the locally enriched cap, although 93% of the copper and 104% of the tonnage represent the current rate of recovery. The cutting-out stope previous to caving is 8 to 10 ft. high. It represents a horizontal slice 10 ft. thick across the full width of the orebody. In the northern end of the orebody—in the Socker claim—an area 175 ft. square was under-cut in the schist before subsidence began. The schist stands better than the granite.‡ Where a stope is wholly in granite a stope 50 ft. square will slough by the time the excavation is completed. In schist a roof three times as large may hold. The granite crushes more easily than the schist, largely on account of less secondary silicification, for where silicification is thorough the ground is

brittle. Granitic country, being granular, contains more moisture than schist and this is a factor in aiding movement. The blasting of large pieces—'bulldozing'—is a relatively unimportant feature of mining in the Inspiration. Obviously the greater the depth of subsidence the more the opportunity for a natural breaking of the ore.

Each chute is sampled by itself before the ore from the eight chutes of a system mingles at the main raise. The orebody has been sampled by churn-drilling. All main raises and drifts are groove-sampled every 5 ft., so that a fairly accurate knowledge of the copper tenor of the material below the first undercutting-level is obtained before such ground is mined. In general, churn-drill samples are the only guide as to the copper content of the material lying above that level.

Machine-men do their own shoveling on the undercutting-levels, where the drift connects with a raise every 12½ ft. When sub-driving between two raises 25 ft. apart, as on the grizzly-level, the miner shovels only enough to make room for his drilling-machine, and a shoveler finishes the job. Indeed, the success of the Inspiration practice depends largely upon the branching system of raises, which obviates the necessity for shoveling. The chute-tappers average 132 tons per man, the shovelers, or 'muckers' as they are needlessly called, 138 tons per man. Except in the haulage-drifts, shoveling is intermittent, and the men designated for that work also clear tracks and carry supplies up the raises. In this kind of mining common labor becomes an insignificant part of the whole operation. Nature is induced to do more than her share. For instance, in the Inspiration mine, producing 17,000 to 21,000 tons of ore daily, only 129 machine-men shifts, and 29 machinememen-helper shifts, per day are required.

'Piping', or the descent of waste in a channel formed through the broken ore, is governed largely by the manner in which the chutes are drawn. If one chute is drawn too long it is bound to lead to the tapping of waste prematurely, that is, before the available supply of broken ore has been withdrawn. When two chutes are drawn, each will tap an inverted cone, of 70°, in the broken ore; this is followed by cap-rock right up to the surface and this waste will fill the lower part of each cone, replacing the ore that has been withdrawn. The cap will descend until it reaches an angle of rest. The distance between the chutes must be small enough to afford as short a base as possible for an upright cone or A-shaped mass of broken ore, which tends to remain between the V-shaped openings made above the chutes, and thus fails to be withdrawn. Each chute of the finger-raise system is drawn individually and so furnishes evidence of the progress of ore-withdrawal and of the lowering of the cap on the ore. The making of minor pipes is inversely proportioned to the attention given to the proper tapping of chutes. A small pipe if ignored will soon become magnified. The man that taps the chute is prone to draw from the one that runs most freely because he is held responsible for a given tonnage. He is not easily supervised because he climbs into the

‡For much of this information, I am indebted to C. E. Arnold (California '06), chief mine engineer to the Inspiration Consolidated Copper Company.

raise and can withdraw a lot of waste before he can be scolded. If caught in the act he has plenty of excuses.

boss for negligence. Raise-engineers frequently graduate to shift-bosses. The idea is being considered of organizing a 'finishing' crew for each section, to take charge of the last stage of the ore-withdrawal; then there would be less excuse for drawing waste. Fine waste will run under a big chunk of ore that has become 'keyed' or wedged. It becomes necessary to blast the big piece and start it moving. The idea is to promote uniform subsidence immediately the chute is tapped and to prevent big pieces from obstructing the regular descent of the broken ore. On the other hand, it is no part of the method to induce a uniform vertical subsidence over a wide area or to cause the surface to descend uniformly (although this was the idea when the mine was first opened), because the subsidence in steps tends to

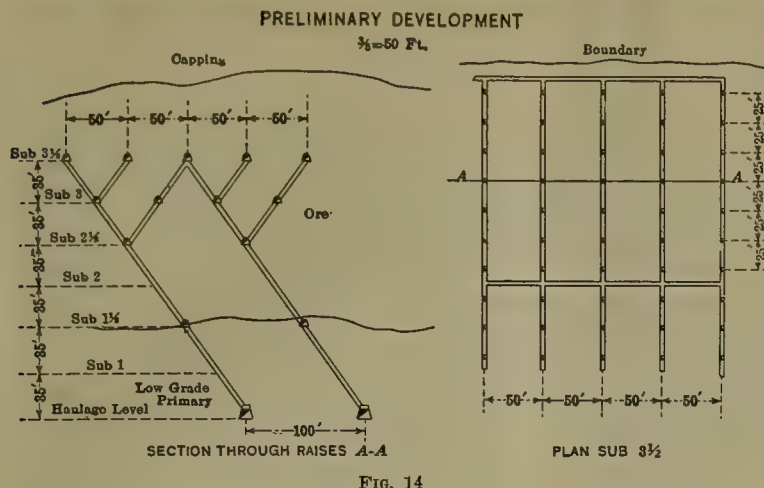

FIG. 14

Apparently the best way to prevent this is to increase the number of bosses—what are called 'boss chute-tappers', and to employ technical men for the purpose. As a rule these chute-tapper bosses appear to be of the same race ('nationality' is the term in general use) as the crew under them. The raise-engineers, who are technical men, are also employed in this work, being assigned charge of given sections of the mine, but their primary duty is to see that the finger-raises are properly placed, and in so doing they are exceedingly helpful to the shift-bosses. However, they are supposed to instruct the boss-tappers when to stop drawing certain chutes as soon as

FIG. 15

they (the engineers) see that waste is coming, but they have no power to discipline these bosses. The regular shift-boss is the first man able to dismiss a chute-tapper

an abnormal cost for repairs, maintenance, and supervision.

The lowest cost of mining consistent with safety is the

FIG. 16

break any 'piping', as is clearly shown in the Captain ground, where the horizontal movement is a most useful factor in preventing such piping. Moreover, if an attempt were made to lower the surface over a large area, the widespread pressure would necessitate the maintenance of an excessive number of openings and compel a wide distribution of workmen, entailing extra supervision. Theoretically, to ensure the highest extraction of ore, it might seem best to draw from a complete series of chutes close together under a large area of ground, drawing a given tonnage from each chute, and repeat the operation so long as the entire area was subsiding bodily, but such a method would involve

aim of operations in both mines. The top-slicing of the main orebody in the Miami is logical on account of the relatively high grade of the ore, which it pays to extract cleanly. The shrinkage system in the Captain claim and the caving in the Joe Bush provoke comparison because they are applied to different parts of the same orebody. It remains to be seen which will prove the better. As yet neither has been carried to a definite conclusion. Churn-drill sampling indicated that the Inspiration orebody as a whole contained 1.72% copper. The mill-feed last year averaged 1.55%. The Miami's Captain ore was estimated at 2.05% and the mill shows 1.9%. The Miami 'slicing' ore, estimated at 2.40%, loses practically nothing in grade by mining by top-slicing and brings the combined total output of the mine up to an average grade of 2.15% copper in the mill. This has been the average grade for the past three years. On the other hand, the Inspiration yields 18,000 tons with 1130 men and the Miami 6000 tons with 810 men. At what point is it economical to sacrifice grade to tonnage? That question cannot be answered without a minute inquiry not only into local conditions, but into the financial policy of each company, for the rate at which a mine is exhausted should be regulated by the value of money, that is, whether it is more profitable to take it out rapidly and re-invest the dividends or to take it out slowly as the dividends are required. The rate of exploitation should also be regulated in accordance with the anticipated market for copper.

Most of the refractory magnesite that has been in general use has peculiar and distinctive properties that are not found in the magnesite deposits of the common type. The value of this refractory material depends not only on its resistance to the corrosive action of heat and metallic slags, but also on the permanence of the forms in which it is put into the furnace. This permanence is due to a natural bonding which tends to make the loose crushed material cling together under furnace heat and thus makes brick forms molded from it more durable. Bricks and granular furnace bottoms made of magnesite that lacks this bond break, and the magnesite floats off on the fluid molten metal and is lost in the slag. Thus, though magnesite that contains a small percentage of iron may be somewhat less resistant to extreme heat than a purer form, the slight fusibility given to the material by the iron tends to hold it in place. For this reason, in part, a type of magnesite so far found only in Austria and Hungary has been the principal source of the refractory magnesia used in this country. The purer magnesite from Greece, California, and elsewhere is used in making plaster or cement or material for other relatively minor uses.—U. S. Geological Survey.

AMERICAN railroads have achieved the feat of adding to their freight service, in the short space of two years, an amount equal to the total traffic of Great Britain, France, Russia, Germany, and Austria combined.

## Platinum

James M. Hill, of the U. S. Geological Survey, states that people are apt to think carelessly of platinum as a good setting for precious stones; the metal is, in fact, indispensable to many of our industries. Dishes and utensils of platinum are absolutely necessary in chemical laboratories, and on their laboratories all great industries depend for guidance. Alloys have been developed for some parts of the ignition systems of internal-combustion engines, but no substitute for platinum has been found for certain delicate parts of these systems. Platinum or allied rare metals have wide application in many instruments of precision used in the physical testing of all kinds of materials. Probably the most important use of platinum at present is in the contact process of making concentrated sulphuric acid, an essential commodity to many industries aside from its use in the manufacture of munitions.

The United States alone apparently uses about 165,000 fine ounces of platinum a year. The known supply of platinum is small; possibly 5,000,000 oz. has been produced in the world to date. Estimates based on the official figures of production from Russia since 1843 (which are taken as 25% low), and on the assumption that Russia has supplied 95% of the world's output, indicate that the total quantity of crude placer platinum produced in the world since 1843 has been less than 4,632,000 troy ounces, or about 159 short tons.

Probably 500,000 oz. of this total output of platinum is in use as a catalyzing agent. The quantity manufactured in the form of chemical and physical equipment cannot be readily ascertained, but may be roughly estimated at 1,000,000 oz. Electrical devices may have required 500,000 oz., but perhaps 250,000 oz. would cover that use. The jewelry industry has probably consumed 1,000,000 oz., and the dental industry also about an equal quantity.

Realizing the urgent necessity of increasing the domestic production of the metals of the platinum group, the U. S. Geological Survey has enlarged its field of investigation of the domestic platiniferous deposits. At the request of the Secretary of Commerce the Geological Survey will also take a census of all unmanufactured and scrap platinum in the United States that can be considered as an immediately available supply. It is confidently hoped that this census will show that the United States has a sufficient reserve of platinum to meet all the immediate needs of industry. The use of platinum in heavy articles of jewelry will be curtailed, if the resolutions adopted by the Jewelers' Vigilance Committee are accepted by the manufacturing jewelers, as is to be expected in the present circumstances. This action will release a considerable supply of metal for the more urgent needs of chemists, as advocated recently at the St. Louis meeting of the American Chemical Society.

THE LIBERTAD MINE

VIEW TOWARD GUALLATIRI, CHICO

SANDSTONE AND LLAMAS

PLAZA IN COROCORO

## Corocoro Copper Mines

By FRANCIS CHURCH LINCOLN

Corocoro is the important copper district of Bolivia, and, next to Lake Superior, is the largest producer of native copper in the world. Although these deposits have been known and worked since the time of the Incas, the early operations were on a small scale. It was not until 1873, when the Compañía Corocoro de Bolivia, a Chilean corporation, consolidated a number of the smaller properties, and began large production. In 1909, a second and larger combination was made when the Corocoro United Mines Co. took over most of the small mines. According to Lester W. Strauss,\* the district produced 100,000 tons of copper from 1873 to 1912, by which time it was shipping at the rate of 5000 tons of copper per year. In 1913 the Arica-La Paz railroad was completed and in the following year a branch line was extended to Corocoro, with the result that oxide and sulphide ores previously untouched were shipped in large quantities. The production for 1915 exceeded 10,000 tons of copper.

The city of Corocoro is the capital of the province of Pacajes in the department of La Paz and has a population of 15,000, consisting mostly of Indians. It lies on the Bolivian plateau at an elevation of 13,210 ft. above sea-level, 70 miles east of the Chilean border, and about mid-way between the main and the western ranges of the Andes. The Bolivian government has constructed a four-mile branch railway connecting Corocoro with the station of Tarejra on the Arica-La Paz railroad, the latter being a metre-gauge line from the part of Arica in Chile to La Paz. Prior to the completion of rail con-

\*"The Mining Magazine", Vol. VII, p. 207.

nection in 1914, copper concentrate from Corocoro was packed or carted to Nazacara on the Desaguadero river, loaded upon steamers for transport to Guagui on lake Titicaca, trans-shipped to steamers for Puno, Peru, and there transferred to trains of the Southern Railway of Peru, which completed the journey to the Peruvian port of Mollendo.

Corocoro is situated in a group of low hills composed of shales, sandstones, and conglomerates ranging in age from Triassic to late Tertiary. These sediments have a general ferruginous color, and are also gypsiferous. A number of the beds of late Tertiary sandstone, lying at short intervals apart, are white in color, instead of the prevailing red, and these contain copper. White copper-bearing beds in reddish sediments are by no means confined to the Corocoro deposit, but occur elsewhere in Bolivia and in Peru. Indeed, these deposits form a belt having a length of 240 miles. Thus, to the south-east of Corocoro, deposits are said to occur at Chacarillas and at Turco, while to the north-west I have examined beds near Guaqui, in Bolivia, near the Peruvian boundary in the vicinity of Desaguadero, and at Tacasa, Peru.

Structurally, the Corocoro district consists of a faulted anticline, striking northerly, and with the copper-bearing beds dipping away from the fault in both directions. The dip varies with locality and with depth, being as low as 35° at the Carmen mine and as high as 80° near the fault at Corocoro. The ore-bearing sandstones, which dip to the west, are locally termed 'vetas' (veins), whereas those dipping eastward are known as 'ramos', that is, branches. The strike of the fault is nearly parallel with that of the 'vetas' and the dip is slightly steeper, but the sedimentary series containing the branches has been rotated in such a manner that on going northward along the fault successively lower members of the 'ramos' series outcrop to the east. For example, near the town of Corocoro, the 'vetas' come to the surface and the 'ramos' are only found in depth, but a mile and a half north of the plaza the 'ramos' begin to outcrop. Apparently the veins and the branches are the severed portions of the same group of copper-bearing sandstones, but they present mineralogical differences that will be noted later.

The Corocoro district has a length of about 11 miles, extending northerly from the Guallatiri claim on the south, through the town of Corocoro and the Libertad and Carmen mines, to the Grau property on the north. The maximum width of the district is about half a mile. The beds of sandstone have been explored and found to contain ore to a depth of over 1600 ft. These copper-bearing sandstones are closely spaced, being separated by beds of shale. They vary in thickness from one inch to 25 ft., averaging 4 ft. The fault-plane itself formerly contained a large orebody, which may possibly have been drag from the 'vetas' and 'ramos', but this is now worked out. The intensity of the mineralization varies in different ore-bearing beds and in different parts of the same bed, and in no instance does the entire bed consist of ore. The copper-bearing beds are generally white

in color, and when they contain red patches they are always free from copper. The white sandstone is much more friable than the red, as a result of having been leached of its original cementing material and of having had this replaced in part only by ore. The mineralization is confined to the filling of the interstices between the grains of sand.

The principal ore-mineral is copper. In the case of the branches this has been oxidized near the surface to malachite, azurite, and chrysocolla, such oxidation extending on an average to a depth of 100 ft. While the 'vetas' also contain native copper in depth, chalcocite occurs near the surface on a zone averaging 300 ft. in vertical extent, while above this the oxidized ore—consisting mainly of the basic copper sulphate, brochantite—has an average depth of 50 ft. Therefore, the 'vetas' present a reversal of the usual occurrence in which native copper turns to sulphide in depth, because there the sulphide turns to native copper, making a most interesting problem for the economic geologist. In a polished section containing both native copper and chalcocite that I examined, these minerals occurred as a cementing material between the grains of sand, and were intergrown in such a manner as to indicate contemporaneous deposition. Other ore-minerals of minor importance are cuprite, domyckite, native silver, and galena. The principal gangue-mineral, besides the quartz of the sandstone, is gypsum; and small amounts of hematite, barite, and celestine also are found. A mineralogical analysis of the ore from the Carmen mine gave the following result: brochantite 12%, chalcocite 3.5, quartz 73, gypsum 7.5, and hematite 4%.

Except for the altitude, the conditions affecting mining at Corocoro are favorable. The climate is cool throughout the year, and the district is healthful. The summer rains begin near the end of December and continue until April. They are by no means continuous, although they sometimes last for several days. The remainder of the year is dry. Indian labor is employed, the wages paid being, in bolivianos, miners 1.80 to 2.20; helpers, 0.80 to 1.20; surface men, 1.40 to 1.80; women, 0.70 to 1.20; machinists, 3.50 to 4; blacksmiths, 3 to 4.50; carpenters, 3 to 4.50; mechanics, 5 to 10. The value of a boliviano is normally 39 cents, but it has recently been as low as 33c., so that the cost of labor is low. Contracts for drifts are let at from 10 to 30 bolivianos per running metre, and shafts are sunk at the rate of 15 to 30 bolivianos per metre. Little timbering is done, as lumber is costly, but dry-wall supports, laid with gypsiferous shale, cost only 6 to 7 bolivianos per metre. Power was formerly produced by burning 'taquia,' the Indian name for llama dung, under steam-boilers. This costs about 3c. per horse-power hour, but Diesel engines burning Peruvian oil are now being introduced, reducing the cost to about one cent per horse-power hour.

The Corocoro United Mines Co. and the Compañía Minera de Corocoro control the district, although there are a few small independent mines, of which the Libertad

is a good example. The Remedios mine of the Compañía Minera has a vertical depth of 500 metres, while the Vizcachani shaft of the Corocoro United is 375 metres deep. The head-frame and rock-house at the latter shaft are shown in an accompanying photograph. The output of this mine is 300 tons per day. The hoisting-engine is a 200-hp. Robey. The efficiency at this altitude is only 45%, and in spite of this the uneconomical 'taquia' is still employed in conjunction with Australian coal. The ore is mined by overhand stoping, black powder and Du Pont dynamite being used as explosives. The sulphide ores are sacked and shipped. Owing to lack of cars, immense quantities of the sacked ore accumulates at times.

The native copper ore is concentrated to an 85% copper concentrate locally known as 'barrilla'. There are five concentrating mills in the district: the Libertad, the San Francisco, the Guaychuni, the Guallatiri Grande, and the Guallatiri Chico. All of the mills suffer from

scarcity of water. The San Francisco is a 200-ton mill treating the ores of the Compañía Minera, while the Guaychuni, Guallatiri Chico, and Guallatiri Grande are 200-ton, 180-ton, and 60-ton plants respectively, engaged in treating ores of the Corocoro United, and all four mills use the same water in turn. Notwithstanding this difficulty the Corocoro United is considering the erection of another mill farther down-stream to treat the low-grade sulphide ore by flotation. The Libertad mill and the view from the Guaychuni mill looking toward the two Guallatiri plants are shown in the photographs. Crushing is done by Chilean mills, and concentration is effected by jigs and tables, the coarse middlings being re-ground in Chilean mills. The cost of producing and marketing the Corocoro 'barrilla' ranges from 6½ to 7½c. per pound of copper.

THE use of high explosives for mining purposes as compared with other purposes is presented in the table for two groups of mining States.

	Alaska, Idaho, Oregon, and Washington, lb., 1916	Arizona, Cali- fornia, and Nevada, lb., 1916
Mining other than coal.....	8,563,685	25,527,705

All other purposes .....	7,418,382	5,407,046

## Chromite

The importance of chromite as a war supply in the manufacture of armor-plate, armor-piercing projectiles, stellite for high-speed tools, and automobile and other special steels can scarcely be over-estimated, according to the U. S. Geological Survey. The chief sources of supply during the last few years have been Rhodesia, New Caledonia, Turkey, and Greece, and the imports in 1916 were 114,655 long tons.

The greatly increased trade, especially in steel, and the consequently larger demand for chromite have stimulated the search for it in the United States, as shown by the increase in production, the amount sold in 1915 being only 255 tons against more than 47,000 tons in 1916. In Maryland and Wyoming there has been only a small production, but in the Pacific Coast States, especially California, the advance in the output has been remarkable. In Oregon the production was more than 3000 tons; in California it was nearly 44,000 tons.

It is evident that for some time to come California will furnish the chief domestic supply. With a lively demand and good prices deposits farther from lines of transportation will be worked.

An interesting feature of future chrome production lies in the fact that T. W. Gruetter has recently established at Kerby, Oregon, a custom plant for concentrating black sand to win its gold and platinum. The black sand of the Klamath mountains usually contains a considerable amount of chromite, and it is believed that by adding magnetic separators to Gruetter's plant to remove the other minerals from the tailing, sufficient chromite may be obtained from the black sand in areas of chromiferous serpentine to make the operation financially successful. The process will evidently yield a high grade of chrome ore, which may be suitable for special uses.

There is considerable chromite in Cuba, but scarcely anything is known of its occurrence in Mexico or Central and South America.

Prospecting for chromite may disclose other supplies, and the most profitable deposits will be those in areas of serpentine that are adjacent to cheap rail or water transportation or connected with it by good roads. Cheap concentration may in places improve the grade of the ore available for profitable mining.

In a technical paper of the U. S. Bureau of Mines, Dr. J. A. Watkins states that one of the earliest symptoms complained of by those daily exposed to small quantities of carbon monoxide is persistent and distressing headache, accompanied at times, when the headache is severe, by nausea and vomiting. A peculiar feature of this symptom is that headache often does not begin until some time after exposure, that is, after the employee has left work, but in most instances it affects the individual the whole time he is at work, becoming more severe as the day wears on. Attacks of giddiness are common.

## The Butte & Superior Case

### Opinion of Judge Bourquin, U. S. District Court of Montana, in Minerals Separation v. Butte & Superior Mining Company

This is trial on the merits of the suit reported in 237 Fed., 401. It involves the patent and claims of the Hyde suit, wherein the Supreme Court held the patent valid, but some claims invalid. The issues are as in the Hyde suit, viz.: Novelty, invention, infringement, and in addition defenses of unreasonable delay and defects in disclaimer of the invalid claims, and estoppel by reason of statements by plaintiffs' counsel to the Supreme Court in arguing the Hyde suit. The evidence herein is that submitted during 25 days and also the record in the Hyde suit. So far as heretofore known the nature and history of the discovery and invention (a process of ore-concentration by air-flotation) are fairly set out in reports of the Hyde suit, of the Miami suit, and of foreign suits cited in a foot-note. This suit is an important contribution and yet it discloses that though the use of the process is very wide, extensive, and growing, its simplicity, economy, and success still surprise and gratify the metallurgical world and its laws or principles of operation still interest and puzzle the scientists. "In the beginning it was very little knowledge and mostly guesswork, and since then there has been every year a little more knowledge and still a great deal of guesswork," testifies one of defendant's experts, Prof. Bancroft of Cornell, a physical chemist of note, acquainted with the process since 1906 and lecturer upon it since 1912. Though speaking for himself alone, the learned doctor's estimate might well be applied to all, practical layman and expert scientist alike.

At the same time, though heretofore somewhat ambiguous and obscure, present knowledge warrants the conclusion that the gist of this remarkable and valuable process and the actual discovery and invention are that whereas theretofore in ore-concentration air had been used in desultory and fugitive bubbles as a makeshift incident of and supplement to oil and skin flotation, air can be made to do all the work by creating in water-ore pulp modified by a suitable oily contaminant an infinitude of bubbles. It is the first of its kind, and the patent sufficiently discloses it and methods to those skilled in the art.

Ambiguity and obscurity were as much due to the extreme simplicity of the process as to the inability then and now to know and explain all its laws or principles. The tendency was to attach prime importance to reduction in amount of oil used when in fact this is but a necessary incident (for which there are substitutes if not equivalents) to the creation of the infinitude of bubbles that do the work. Despite this tendency and to overlook

the simple and obvious, the patent fairly clearly sets out the various ways and means to create this infinitude of bubbles and that they do the work.

The tests to determine which kind and amount of "oily substance yields the proportion of froth or scum desired," that flotation is "mainly from the inclusion of air bubbles," the froth, the agitation, all are so many guides in the patent, pointing the skilled operator to and including the infinitude of bubbles and the degree of agitation and amount of soap or oil to produce such bubbles, as surely as the word "crystallization" points to appropriate temperature in *Commercial Co. v. Co.*, 135 U. S., 189, and the words "uttered sound" by the "human voice," to articulate speech in the telephone cases, 126 U. S., 531.

Of the new evidence herein are learned dissertations upon the philosophy of the process—upon the philosophy of bubbles, the heart of it, by Professors Bancroft of Cornell and Taggart and Beach of Yale, and Doctors Sadtler of Philadelphia and Grosvenor of New York. From these it is gathered that the mere introduction of particles of air into a liquid does not create bubbles, but that they are created by subsequent agitation, either applied or self-agitation. Air particles introduced into pure water are incapable of creating bubbles. The reasons are the surface-tension of the water and the lack of viscosity to create a sufficient film about the air particles, compel the escape of the air particles into the atmosphere and no bubble is formed. Some soaps and oils possess the quality to lessen this surface-tension of water and to give or increase this necessary viscosity. Their addition in appropriate quantity to water enable air particles introduced therein to create bubbles. Rather, the meeting and co-action of water, oil, and air create a film composed of all three and which surrounds the air particles. This film is more viscous than the mass of the water, and rising to the surface, the tension of which (and of the films) has been reduced by the oil, maintains itself as an air bubble. This quality of oil is of first importance in the process. Another of lesser importance and which all oils possess is the "preferential affinity for metalliferous matter over gangue." Of lesser importance, because it is now known (and patented) that given another contaminant than oil but which possesses the like bubble-making quality though not the said "preferential affinity," the process is equally successfully worked. Air also possesses this "preferential affinity," and in view of the foregoing it well may be that the capture as well as the flotation of

the metallic particles is more due to the great volume of air than to the infinitesimal oil. That in this process air without oil cannot capture and retain the metallic particles, seems due to its inability to create bubbles without oil. And why this capture in any case, is still of the unsolved phenomena of the process. On the other hand, water has a preferential affinity for gangue over metalliferous matter. That is, it wets the former more readily than it does the latter. And this contributes to the process in that oil and air displace water from the surface of metalliferous matter more easily and quickly than from gangue, and so more readily capture and float the former than the latter. At the same time, despite these preferential affinities, in successful operation of the process the bubbles generally float more gangue than metal, more in quantity but not in proportion, and why is also unsolved.

There are "critical proportions" of any oil used in this process, perhaps not a sharp divide, but rather a broad one. For the amount of oil to produce sufficient and efficient bubbles must depend on many other factors, viz: the working-cell space, amount of water, degree of agitation, kind and amount of ore, and perhaps on occasion amount of metallic content, kind of oil, etc. For example, if a ton of ore be agitated in a lake of water, doubtless a lake of oil will be necessary to create sufficient bubbles to capture the metal in the ore. But with bona fide operations in a good workmanlike manner—with the proportion of space, water, agitation, etc., such operations and manner dictate, the range in amount of oil will be narrow and well within 1% on the ore. These "critical proportions" are like those known to and solved by every child with its pipe and bowl of suds. Too little soap, the bubbles are few, small, fragile, and break quickly. Too much soap, they flow from the pipe in a torrent, are heavy, and refuse to float. The right amount of soap, the "critical proportions," his bubbles are large, detach readily, and float high, far, and for long. So is it with the bubbles in this process. With excess oil but not enough to defeat bubbles altogether, though of fair aspect to the eye the bubbles will not do the work. In the excess oil in the films the metallic particles do not cling but swim or slide to the bubble's lower surface, "neck off"—detach, and sink. The untechnical workman recognizes there are "critical proportions" of oil, and small deviation from the predetermined amount in the feed, whether more or less, manifests itself to him in the appearance of the froth and poorer results; and he knows and remedies the error in oil.

Metallic content of ore seems of little importance—sometimes seems to require oil inversely. For example, a local operator with the process upon ore from the same vein as defendant's, uses 0.7 lb. of oil per ton of ore of 11.23% zinc content, making 50.59% concentrates with 94% recoveries, and in the same plant uses 2.83 lb. of the like oil per ton of tails of 0.97% copper content, making 9.085% concentrates and 0.266% tails. It is apparent it is the air and not at all the oil that floats the mineral, noting that in the first of this example 211 lb.

of zinc are floated by air bubbles in the creation of which only 0.7 lb. of oil is used. How the air particles are introduced into the pulp is immaterial. For introduced, they are still particles and not bubbles. Agitation subsequent to introduction is vital and alone can convert air particles into water-oil-air bubbles. It is this subsequent agitation that within the claims of the patent agitates "the mixture until the oil-coated mineral matter forms into a froth" or "to form a froth." And it is all one, whether this be applied agitation or self-agitation—the agitation set up by the air particles themselves in merely rising through the mass and thereby coming in contact with both water and oil, all co-acting to form bubbles which capture the metal. The mineral particles, either oiled before or by contact with bubbles, attach to and enter the viscous film of the bubbles. The particles also increase the viscosity of the bubble films, armor them and increase their stability, perhaps as stays that decreasing the area of unsupported surfaces, increase the latter's ability to resist rupture.

The great mass of new evidence herein is but cumulative of the Hyde suit. The only new publication is the 'California Journal of Technology' detailing a suggestive but rather misleading and abandoned experiment, sufficiently referred to and disposed of in the Miami suit.

There is much evidence that progress in the process and methods of operating it, now discloses that with some ores and some oils or mixtures of oils, the process can be fairly successfully operated with 1% and more of oil. This is really admitted by plaintiff and is taken as proven. But it is also proven practically without conflict that in all the operations with this process not to exceed 0.2% of oil is used, save by defendant and others in like situation and only since the decision in the Hyde suit and solely to avoid infringement; that some oils are effective and more are ineffective to operate the process; and that the excess oil used is useless, wasted, and harmful.

But the defendant contends that this evidence demonstrates the process lacks novelty and invention, and that because of it the record is substantially different from the Hyde suit, the decision there should not control here, and the patent is and ought to be held invalid. This is without support in the patent and Hyde decision.

In describing the invention the patent refers to Catermole and says that the patentees "have found that if the proportion of oily substance be considerably reduced—say to a fraction of 1% on the ore," after vigorous agitation the metallic particles rise to the surface in a froth; that the proportion thereof varies considerably with different ores and different oils, and so it is necessary to test "to determine which oily substance yields the proportion of froth or scum desired." An example of a particular ore and oil is of oil "say from 0.02% to 0.5% on the weight of ore," wherein on cessation of agitation "a large proportion of the mineral present rises to the surface in the form of a froth or scum which has derived its power of flotation mainly from the in-

clusion of air bubbles introduced into the mass by the agitation, such bubbles or air-films adhering only to the mineral particles which are coated" with the oil which has "a preferential affinity for metalliferous matter over gangue." It adds that the minimum of that oil "may be under 0.1% of the ore, but this proportion has been found suitable and economical."

The claims are (1) for "oily liquid \* \* \* to a fraction of 1% on the ore," (2) for oleic acid "to 0.02—0.5% on the ore," and (3) for "a small quantity of oil." These last were held invalid. In upholding the patent the Supreme Court says that "as described and practised" the process consists "in the use of an amount of oil which is 'critical' and minute as compared with the amount used in prior processes, 'amounting to a fraction of 1% on the ore,' and in so impregnating with air the mass \* \* \* by agitation \* \* \* as to cause to rise to the surface \* \* \* a froth \* \* \* which is composed of air bubbles with only a trace of oil in them, which carry in mechanical suspension a very high percentage of the metal"; that "it differs so essentially from all prior processes in its character, in its simplicity of operation, and in the resulting concentrate, that we are persuaded that it constitutes a new and patentable discovery"; that the facts are not overstated by Liebmann that "the present invention differs essentially from all previous results. It is true that oil is one of the substances used but it is used in quantities much smaller than was ever heard of, and it produces a result never obtained before. The minerals are obtained in a froth of a peculiar character, consisting of air bubbles which in their covering film have the minerals imbedded in such manner that they form a complete surface all over the bubbles. A remarkable fact with regard to this froth is that, although the very light and easily destructible air bubbles are covered with a heavy mineral, yet the froth is stable and utterly different from any froth known before, being so permanent in character that I have personally seen it stand for 24 hours without any change having taken place. The simplicity of the operation, as compared with the prior attempts, is startling. All that has to be done is to add a minute quantity of oil to the pulp to which acid may or may not be added, agitate for from 2½ to 10 minutes and then after a few seconds collect from the surface the froth which will contain a large percentage of the minerals present in the ore"; that the Court is convinced "that the small amount of oil used makes it clear that the lifting force which separates the metallic particles of the pulp from the other substances of it is not to be found principally in the buoyancy of the oil used, as was the case in prior processes, but that this force is to be found, chiefly, in the buoyancy of the air bubbles introduced into the mixture by an agitation greater than and different from that which had been resorted to before and that this advance on the prior art and the resulting froth concentrate so different from the product of other processes make of it a patentable discovery as new and original as it has proved useful and econom-

ical"; that the Court agrees with the House of Lord's decision that the process is not one before described but a new method in which flotation is by the "buoyancy of air bubbles"; that tests to determine the necessary "amount of oil and the extent of agitation," and "the range of treatment within the terms of the claims," satisfy the law; but that while the patentees "discovered the final step, precedent investigations were so informing that this final step was not a long one and the patent must be confined to the results obtained by the use of oil within the proportions often described in the testimony and in the claims of the patent as 'critical proportions,' amounting to a fraction of 1% on the ore, and therefore \* \* \* the patent is valid as to claims No. 1, 2, 3, 5, 6, 7, and 12 \* \* \* but \* \* \* invalid as to claims 9, 10, and 11." Those held invalid are those heretofore referred to as (3). It seems clear neither patent nor decision undertakes to say the process depends upon less than 1% of oil or is inoperative with 1% or more of oil.

It is true that in the beginning and during the Hyde suit the patentees inclined to so believe, or at least believed better results would be obtained with a fraction of 1% of oil. Perhaps limited investigation and experience with few ores and oils justified the belief. Indeed, all experience to date, plaintiffs', defendant's, strangers', demonstrates that with any ore and any efficient oil, less than 1% of oil gives better results, all circumstances considered. The "critical proportions" referred to seem absent, in terms, from the patent, and ought not to be adversely inferred in disregard of construction in favor of the patentee where the patent is ambiguous. The patent describes oil "considerably reduced," and refers to a "fraction of 1%" by way of example. And though some claims limit oil to such fraction, and a limited range within it, others are for "a small quantity" and for that reason held invalid by the Supreme Court. With the later knowledge of this suit, it is doubted that such would be the decision now. It is to be observed that this limitation of the patent indicates the Supreme Court believed the process might be operative with 1% and more of oil, and contemplated that this would not defeat the patent but might affect infringement. If the patent is limited to the use of a fraction of 1% of oil, that the process can be operated with 1% and more is not material to validity though it may be to infringement. For if a patentee limits his claim voluntarily or because he does not know the extent of his invention, he abandons the excess and the patent is valid to the extent of the claim. If it be conceded that new evidence might warrant and demand that a Trial Court hold invalid a patent by the Supreme Court held valid, such evidence must be unequivocal, clear, and convincing, in quality and quantity that inspires confidence and produces conviction that the patent is invalid and that the Supreme Court would so determine beyond a reasonable doubt. Not only does it fail here, but it strengthens the conviction that the patent is valid.

The disclaimer to conform to the Supreme Court's de-

cision that claims 9, 10, and 11 are invalid, was filed 107 days after said decision and after mandate but before expiration of time for rehearing. It was timely filed. In substance it fairly conforms to the language of the decision, disclaiming "from claims 9, 10, and 11 \* \* \* any process of concentrating powdered ores excepting where the results obtained are the results obtained by the use of oil in a quantity amounting to a fraction of 1% on the ore." The parties differ in its interpretation even as they do in respect to the decision. Written words, not oral claims, control. The patent claims included what the patentees were entitled to and more. The decision pointed out the excess. The patentees disclaim the excess. They can safely rely upon the decision, and a disclaimer conforming to the language of the decision is sufficient. The patent valid, defendant admits infringement from before suit commenced to January 7, 1917, and denies infringement thereafter. During the period of admitted infringement it applied the process to some 1,598,000 dry tons of crushed ore, the tailings from water concentration, of mineral zinc content by yearly averages as follows: 1913, 15.14%; 1914, 14.14%; 1915, 13.66%; 1916, 12.89%. Oil used by yearly averages is as follows: 1913, 5.58 lb.; 1914, 2.22 lb.; 1915, 1.49 lb.; 1916, 1.43 lb. The concentrate grade by yearly averages is as follows: 1913, 47.60%; 1914, 53.03%; 1915, 54.62%; 1916, 53.83%; and recoveries (apparent) likewise, are for 1913, 80.03%; 1914, 86.08%; 1915, 90.18%; 1916, 92.63%. Progress is indicated by leaner ores, less oil, higher grade of concentrates, greater recoveries, all coincident with advancing time.

It is noted that the process is responsible for advance in methods, devices, and machines for its operation. To briefly describe defendant's during infringement admitted, the water-concentrate tailings, oil added, flowed to the head of a pyramid machine of seven cells in series, each cell containing a revolving perpendicular spindle and horizontal blades, and having two opposed spitzkasten. The agitation was very violent. The tails from each cell flowed by gravity to the cell immediately below, those from the last cell flowing to Callow air cells which produced froth-middlings returning to the head of the pyramid, and tails, to waste. The first three cells of the pyramid produced froth rougher concentrates which flowed to cleaners, and the other cells produced froth middlings which returned to the head of the pyramid. The rougher concentrates passed through five cleaner-cells for washing. This produced concentrates which flowed to and through five re-cleaner cells, and tails which returned to the head of the pyramid. The re-cleaners produced final concentrates, and tails which returned to the head of the cleaner. Commencing January 7, 1917, the defendant's methods are as before, save pneumatic as well as mechanical agitation is employed in the lower four cells of the pyramid, some spitzkasten are blocked, an additional cleaner operation is used and from which for some unexplained reason 8.65% zinc tails go to waste, and oil in amount 1% and more is used.

Defendant not very insistently claims results for this latter period are more profitable than for the former, but plaintiffs' analysis (neither denied nor criticized and beyond both) of defendant's reports and tabulations makes manifest the fact is otherwise to the extent of about \$1.75 per ton of ore—an enormous loss on 45,000 tons monthly. There is considerable like testimony in reference to operations by other infringers. However, coming as it does after very large operations, investigations, and experiments of several years, after the Supreme Court's decision in the Hyde suit, it is incredible that use of 20 pounds of oil per ton results in more profit than one and a half to four pounds per ton. If it does, these great concerns would not have waited to discover the fact and employ it, until after the said decision. Defendant practically admits that it now uses the present amount of oil merely to avoid the patent. It is done, says its counsel in argument, "because the Supreme Court has said it is not at liberty to use less than one-half per cent," and "out of abundance of caution" it uses "more than 1%." The evidence likewise persuades. If the excess oil were effective and useful and not inert, useless, and harmful, it would be without the claims of the patent, would be of that the patentees abandoned to the public, and would involve no infringement.

Plaintiffs somewhat laboriously argue that though the Supreme Court held that the claim for use of "a small quantity of oil" to produce froth is too broad and so invalid, yet since the court identifies the invention by the "results obtained," though confining it to the "results obtained" by the use of oil "amounting to a fraction of 1% on the ore," the import of the decision is that if the results obtained by operation of the process with oil in amount 1% and more on the ore are like and the same results obtained with a fraction of 1% of oil, it is within the patent and is infringement. This is more ingenious than sound, and would deprive the decision of effect. The Court does not confine the patent to the *like* or *same* results obtained, but to *the* results obtained by the use of a fraction of 1% of oil on the ore. It is believed, however, that the Court employs the word "use" in its or the ordinary sense of beneficial service. Patent law is not concerned with the useless, and a valuable result sought is not "obtained" by but *despite* the use of an excess of an essential ingredient, which excess render no or ill service. From the evidence it appears the larger part of the oil used by defendant and all in excess of a fraction of 1% on the ore, if not inert is ineffective, wasted, and injurious to the process and results. Before January 7, 1917, defendant used only pine-oil and about 1.43 lb. per ton of ore, with excellent results. Since said date it uses a mixture of 20 to 24 pounds of oil per ton of ore, made up of 18% of pine-oil, 12% of kerosene oil, and 70% of fuel-oil, with poorer results. The kerosene and fuel-oil are petroleum. As before stated many oils are ineffective to operate the process, and that is because they have not the quality that contributes to bubble-making. What this quality consists of, wherein it lies, does not appear. With these ineffec-

tive oils, agitation will not produce froth and so there is no flotation of the metallic particles. One of defendant's witnesses testifies that in the laboratory and plant of the Utah Copper, one thousand oils have been tried, of which but two mixtures give satisfaction. Petroleum seems generally ineffective by the evidence of both parties, though some of defendant's witnesses testify to sometime successful experiments with them. Incidentally, there is suspicion that with experiments, as with figures, can be done anything for or against, without impropriety in the operator. Some petroleum is used in limited quantities, but always in combination with a recognized bubble-making oil, and only, it is said, for a somewhat bubble-stabilizing effect. Defendant's present mixture of oil contains more pine oil on the ore than it used alone before January 7, 1917. The other factors the same, it is obvious the excess petroleum in the mixture are responsible for the poorer results.

Defendant uses the patent process, uses plaintiffs' invention of ore-concentration by air-bubble flotation, uses the same elements in the same combination in the same way with the same function to the same but poorer results; and exceeding the patent claims in reference to one ingredient (oil), uselessly, wastefully, and injuriously and merely with intent to avoid the letter of the patent, does not avoid infringement. The addition of the excess oil no more adds to or changes the process, no more avoids infringement, than would the addition of milk or other useless substance not a part of the process. The excess oil exercises either no function or less efficiently exercises the same function in the same way as the limited oil, and to the same but poorer results. To secure to patentees their invention, the law looks quite through mere devices and forms, to the substance of things. And if in substance the invention is taken, if the thing that does the work is taken, all devices to evade the letter of the patent avail nothing to escape the consequences of infringement. Neither principle nor authority to the contrary, is cited or known to the Court.

In the matter of estoppel affecting infringement, it suffices to say neither in pleading nor proof do the elements of estoppel appear. Although the evidence is of great volume and the arguments of relative length, all have been carefully considered, but require no additional reference herein.

The patent is valid in respect to all claims involved. Defendant throughout has infringed and now infringes all said claims save 5, 6, and 7, and decree accordingly.

BOURQUIN, J.

August 25, 1917.

VICTOR C. HEIKES, of the U. S. Geological Survey, states that there were 527 producing mines in Arizona during 1916. The ore produced was 17,033,810 tons and the metals derived therefrom: gold, 192,801 oz.; silver, 7,212,039 oz.; copper, 721,833,169 lb.; lead, 27,062,087 lb.; zinc, 18,220,863 lb. The total value of the metals was \$190,806,170.

## Prices of Graphite

\*Ceylon graphite of the better grades is more largely used by crucible makers than domestic flake-graphite and, even in normal times, commands a higher price. During the last three years the tremendous increase in crucible manufacture has caused a demand for the Ceylon product greatly in excess of the available supply and the price has constantly increased. The sharp increase of price for all grades of Ceylon graphite in 1916 over that for previous years is in part due to the fact that a much larger proportion of the highest-grade product was imported. In March 1917 the prices of Ceylon graphite, ex-dock, New York, were approximately as follows: No. 1 lump, 28 to 30c. per pound; No. 1 chip, 19 to 21c.; No. 1 dust, 11 to 12c. The prices paid for the highest grade of domestic graphite at the mines in 1916 ranged from 10 to 16c. per pound. The New York prices varied greatly according to the demand. In the summer of 1916 the price was as high as 18c. per pound. At the end of the year increased imports from Ceylon reduced the price, and in March 1917 domestic graphite of good grade could be bought for 12 or 13c. per pound. The prices paid at the mines for the highest grade product, in cents per pound, have been as follows: 1911 and 1912, 6 to 7; 1913, 6 to 8; 1914, 6½ to 8; 1915, 7 to 10; 1916, 10 to 16.

The sharp increase in the value of the Ceylon graphite imported in 1916 is due largely to the fact that, owing to the high freight-rates and scarcity of ships, the higher-grade material formed a larger proportion of the total.

Domestic amorphous graphite brought widely varying prices according to the grade of the product, but in general not greatly in advance of prices before the War. Amorphous graphite from Chosen averaged about \$45 per ton on the New York market, a price due largely to the prevailing high freight rates.

## Assessment Work on Mining Claims

Congress has passed a resolution exempting officers and enlisted men who have been or may be mustered into the military or naval service from the \$100 worth of assessment work required by law upon unpatented mining claims that may be in their possession at the time of enlistment. It is necessary for the enlisted owner to file in the office, where the location is recorded, a notice of his muster into the service of the United States and of his desire to hold his mining claim under this resolution. This must be done before the expiration of the assessment year during which the claim-owner is mustered. The exemption is for the period of enlistment.

In 1915 there was a production of 23,224 short tons of antimonial lead of a value of \$3,665,736, and 5364 tons of antimony, valued at \$2,373,760.

\*Abstract from Mineral Resources, U. S. Geological Survey.

# The Submarine and Kindred Problems

\*The thousands of suggestions and plans presented to the Naval Consulting Board for assisting the Government in the present emergency indicate the patriotic fervor of the mass of our citizens. The Board makes a careful examination of every proposal presented. To facilitate this work, by suggesting the elimination of impractical ideas, the Board calls to the attention of those who desire to assist it some of the popular misconceptions as to certain fundamental principles which are most frequently misunderstood by the layman.

**ELECTRO-MAGNETS AND MAGNETISM.** The electro-magnet, the magnetic-needle, permanent magnets, and magnetism have been carefully studied for many years; and the laws governing their application may be found in any book on the subject. Although these laws are generally known, and applied in a practical manner, in a multitude of devices in common use, even the man of wide experience will be astonished at the limited range of practical effect of electro-magnets of large size. For instance, the magnets used in our manufacturing plants for lifting heavy masses of iron or steel are designed to exercise maximum magnetic effect, and for operation require a very considerable amount of electrical energy; yet a magnet which can lift twenty tons, when placed in contact with an iron plate of that weight, will not lift a two-inch cube of iron or steel if separated from it a distance of two feet. Therefore proposed devices which depend on the attractive power of magnets for their operation in deflecting or arresting torpedoes, mines, or submarines, must be governed by the simple laws of magnetism. A torpedo weighing approximately 2500 lb., and traveling at a speed of 25 to 45 miles an hour, will not be deflected to any practical degree by any known application of magnetism; and it is not believed that an enemy torpedo, mine or submarine will ever be found in a position to be interfered with effectively by any electro-magnetic means, however powerful.

There is a general misconception regarding the 'electrification' of water and the atmosphere. There is no known method of 'charging the sea with electricity,' or 'shooting a bomb of electricity,' or of 'charging the atmosphere with electrocuting current.' Suggestions along these lines should show that the writer has made research in the laws governing the application of electrical energy and should contain sufficient proof of their feasibility to insure serious consideration. On the other hand, applications of the transmission of electrical energy by means of alternating or pulsating currents—as used in wireless systems, for example—belong to a different class of electrical development. Inventive genius

is rapidly improving apparatus of this type for the sending and receiving of signals and messages, and the possibility of valuable results in this field is unlimited.

**PROTECTION AGAINST SUBMARINE ATTACK.** This subject, which is occupying the public mind as is no other, divides itself into a number of problems, the most important being the following:

(a) Means of discovering the approach of a hostile submarine and locating it so as to permit of prompt action for combating its attack.

(b) Protection of cargo-carrying ships by nets, guards, and screens.

(c) Protection through decreasing the visibility of vessels.

(d) Methods of destroying or blinding a hostile submarine.

Submarines, to operate most effectively, must approach within close range of the vessel which is intended to be torpedoed. The installation of offensive weapons on the merchant marine has increased the necessity for the utmost care being exercised by the submarine commander in remaining unseen by the officers on the vessel to be attacked.

Reports from abroad indicate that in many cases submarines must have remained along certain lanes of travel for periods extending into weeks of waiting with the expectation of torpedoing certain vessels. Under certain favorable conditions, where the waters are less than 200 ft. in depth, a submarine might lie at rest on the bottom, and if equipped with sensitive listening devices attempt to detect the approach of a vessel. As soon as this evidence was secured the submarine might come to the surface for a quick observation by means of the periscope and in this manner obtain the proper aim which would be required to register an effective hit. In case the water is more than 200 ft. in depth a submarine must be kept in motion to obtain steerage way in order to hold its proper depth of submergence. This speed may not exceed 4 or 5 miles per hour, but to remain submerged, and at the same time unobserved, the water must be at least 60 ft. deep.

The latest type of submarine which is being used abroad has a surface speed of at least 17 knots per hour and a submerged speed of probably less than 10 knots. The superior gun-fire from the merchantman which has been properly equipped would make it necessary for the submarine commander to obtain his observations, such as would permit accurate aiming of the torpedo, during the very brief interval of time required to come to the surface for observation through the periscope and to again submerge. If running near the surface, the periscope might be raised, a quick observation taken,

\*Bulletin No. 1, issued by the Naval Consulting Board of the United States.

and lowered again within 30 seconds. If, however, the submarine is on the surface and hatches uncovered, from one to four minutes will be required to completely submerge, depending upon circumstances.

A submarine of recent type probably has a total radius of action of as much as 8000 miles when traveling at a moderate cruising speed of from 10 to 11 knots, and may remain away from its home-base for as much as one month, without requiring either fuel or other supplies during this period. This type of submarine may have as many as three periscopes, two conning towers and two rapid-fire guns attached to the upper portion of its hull. The vessel is steered by very efficient gyroscopic compasses, which are unaffected by extraneous magnetic or electrical influences.

A general understanding of the capabilities of the modern submarine for offensive operations will make it easier to appreciate the importance of the three problems which follow:

**MEANS FOR DISCOVERY.** The aeroplane. When the condition of sea and air are favorable, a submarine is readily discernible from an aeroplane flying at a sufficient height even though the submarine be submerged to a considerable depth.

While aeroplanes have thus been used successfully in the English Channel, they are unable to fly far out to sea where the submarines are now most active. Mother ships for carrying and launching aeroplanes might be used in this connection, but there are only a small number of such ships in operation and the construction of others under present conditions is necessarily a slow process.

Various sound-recording devices, intended to locate surface-vessels, submarines, and even moving torpedoes, are now being carefully tested. Water is an excellent conductor of sound, and the development and improvement of such apparatus offers a promising field for inventive endeavor to those who possess adequate scientific training and laboratory facilities.

Many devices are suggested which depend upon optical means of detection, such as special forms of telescopes and field-glasses to be mounted on ships, or on scouting vessels. Many special forms of searchlights and projectors have been suggested. The fact that a moving torpedo leaves in its wake a stream of air-bubbles caused by the exhaust-air from its propelling engines, offers, under favorable conditions, one means for discovering the approach of a torpedo. This evidence is, however, difficult to detect in a rough sea or at night, and, furthermore, the bubbles do not reach the surface of the water until after the torpedo has traveled onward a distance of from 50 to 200 ft. toward its target. The dragging of trawls, or nets, by special guard-boats, not only with the view of locating submerged submarines but also to sweep up floating and stationary mines, is frequently suggested. Under certain conditions this operation is practicable and effective.

It will be seen that each of the above methods, how-

ever useful, has its limitations, and scientists and inventors should apply themselves not only to the task of improving these, but also of finding supplementary methods and devices.

**PROTECTION OF CARGO-CARRYING SHIPS BY NETS OR SCREENS.** Many designs of such devices are suggested, and most of them are intended to be attached to the hull of the vessel to be protected. Many other suggestions along these lines, and differing only in some of their minor characteristics from the foregoing, have been received by the Board. Up to the present time not one of these proposals involving screens of any kind has received the approval of the Navy Department or of the Merchant Marine. The principal objections offered to these devices are that they are heavy, difficult to hold in position, unmanageable in a heavy sea, and that they interfere with the speed and with the ability of the vessel to manoeuvre. The undeniable evidence which has been accumulated during the past few months of submarine activity has demonstrated that the immunity of a vessel to submarine attack is dependent very largely on its speed and also its manoeuvring ability. The percentage of vessels having speeds of 15 knots or more which have suffered from submarine attack is very small, while the losses of slow vessels, whose speed is less than that of a submerged submarine, is practically one hundred per cent of those attacked. Many of the suggested devices would prevent the launching of life-boats or rafts from the vessel to be protected. It is barely possible, however, that there may be developed some form of this general plan which will be found practicable. In no other field have so many suggestions or so many duplicate inventions been presented to the Board.

**PROTECTION THROUGH INVISIBILITY.** The point of lookout on a submarine being close to the water, the position of a vessel at a distance can only be determined by observing its smoke, which floats high in the air. Improved smokeless combustion is therefore desirable. Relative invisibility may also be afforded by methods of painting. Suggestions as to any other methods of reducing the range of visibility will be of interest.

**DESTRUCTION AND BLINDING OF THE SUBMARINES.** A rapid-fire gun is effective when the submarine is seen within accurate range of the gun; but the target is so small that it is difficult to hit.

The powerful effect of any submarine explosion on all neighboring bodies provides a simple means of destroying or crippling an undersea boat. Once it has been even approximately located, the setting-off of a heavy charge of high explosive, well submerged in the vicinity of the submarine, will bring about this result.

In certain areas, a quantity of heavy, black petroleum or similar substance which will float on the surface of the water has proved an effective means of clouding the optical glass in the periscope's exposed end.

Under favorable conditions of wind and position, many vessels have saved themselves from torpedo attack by the production of a smoke-screen. This may be formed

either by incomplete combustion of the oil used for fuel by most naval vessels, or it may be created by burning chemicals, such as phosphorus and coal tar, or mixtures in which both of these and other materials are used.

After hiding itself from the submarine in a cloud of dense smoke, the vessel, if possessed of sufficient speed, may be able by a quick manoeuvre to change her position and escape before the submarine is able to discharge a torpedo.

**MINES.** Ever since the first use of gunpowder in the prosecution of war, mines and torpedoes have received great attention both from the warrior and the inventor. Mines are either fixed or floating. The fixed or stationary submarine mine is fired by contact, electricity, timing device or fuse. Such mines, which are extensively used by all navies, are rugged in design and may contain large charges of explosives. They are placed in position by especially equipped mine-laying vessels. Such a mine is provided with an anchoring device.

Floating mines differ from fixed mines in that they are unanchored, and, unless guard boats are at hand to warn friendly vessels of their proximity, may be as dangerous to friend as to foe. Such mines must be, according to laws of war, designed to become inoperative within a few hours after being set adrift.

**TORPEDOES.** The modern submarine torpedo is about 20 inches in diameter and 20 ft. in length: is self-propelled: is not steered by magnetic means: and keeps a fairly accurate course for several thousand yards at an average speed of more than 30 miles an hour. Its weight is approximately a ton and a quarter; and, when traveling at normal speed, possesses great momentum—in fact, in one case, when the high explosive charge in the ‘war-head’ failed properly to detonate, the body of the torpedo penetrated the steel hull of the ship attacked. Torpedoes are also provided with means to more or less effectively cut through screens, nets, or guards placed in their path.

A torpedo is projected from a submarine or other vessel by means of a special form of tube or gun. A small charge of gunpowder or compressed air is employed to start the torpedo, after which—if of the usual self-propelling type—it is driven through the water by its own compressed-air motor, the air being supplied from a strongly built reservoir within the body of the torpedo itself. The torpedo is kept upon its course by a gyroscope steering mechanism, which is immune to outside magnetic disturbances.

The detonation of the torpedo is accomplished through a mechanism placed within its warhead; and if the torpedo is either abruptly diverted from its course or is checked in its forward motion, the firing device, which is operated by arrested momentum rather than by any form of a projecting firing-pin, instantly ignites the heavy charge of explosive contained within the warhead. The explosion, if it takes place within twenty feet of the vessel, will usually rupture the ship’s plating, because of the terrific blow transmitted through the water from

the point of the explosion to the ship’s side. The depth at which a torpedo travels may be regulated and is usually between 12 and 15 ft. below the surface.

**CONFINING THE SUBMARINES.** The question as to why submarines are not destroyed before they reach the open sea is a most natural one, and the best answer which it is possible to give, according to the officers of our Navy and those of the foreign commissions who have visited this country, is as follows:

The submarine bases are very strongly protected by land batteries, aeroplane observers and large areas of thickly mined waters extending to such distances that the largest naval gun cannot get within range of the bases. In spite of these protections, there is now going on a continuous attempt on the part of the Allied navies to entrap or otherwise defeat the submarines as they emerge from the protected areas. Nets are laid and are promptly removed by the enemy, whose trawlers are in turn attacked by our destroyers. The design of these nets and the detailed arrangement of their fastenings and attachments offer a broad field for invention, but it should be remembered that they must be capable of being used in waters in which there is a tidal current running from two to five miles per hour. Many suggestions for ‘bottling up’ these bases have been offered, but, as will be realized, it is not desirable to publish information which would indicate even in the smallest degree this country’s plans.

**SHIPS AND SHIPBUILDING.** Many suggestions are made for ships of unusual form to provide for safety in case of a torpedo or mine exploding near or against the hull. Most of these plans are an elaboration of the usual watertight bulkhead construction now required as structural design for all modern ships.

The multiplicity of watertight compartments in any hull design tends to add to the vessel’s safety.

The modern tank steamer used to carry fluid cargoes, such as petroleum products or molasses, is a good example of this design, which has been in general use for many years.

The explosion of a nearby submarine mine or torpedo frequently tears great rents in the ship’s plating, in some cases opening a jagged hole ten feet or more across, but the destructive effect on the hull of a ship caused by the explosion of a mine or torpedo may be greatly diminished by special hull construction.

From recent experiments and experience, it has been demonstrated that the average merchant steamer may be seriously damaged by the explosion of a torpedo thirty-five feet away from its hull, but the destructive effect at any given distance from the point of explosion depends to a large extent upon the design and condition of steel framing and plating. A vessel with a strongly built hull can withstand an explosion that would destroy a weaker vessel.

COMMUNICATIONS should be addressed to

THOMAS ROBINS, Secretary, Naval Consulting Board,  
13 Park Row, New York, N. Y.

# The Flotation Process

By E. P. MATHEWSON

\*This process has revolutionized the metallurgy of copper. Recently constructed plants, costing millions of dollars, have been discarded or scrapped and the flotation process introduced. Notable examples of this are the Washoe reduction works at Anaconda and the plants of the Utah Copper Co. at Garfield, Utah.

It took considerable time to convince the copper metallurgists of the country that the flotation process was a success, but as soon as a satisfactory demonstration was made, which occurred after numerous failures, these metallurgists took up the new process with avidity, scrapped their old plants, and re-built to adopt this modern system of concentration.

The MINING AND SCIENTIFIC PRESS of San Francisco, under the able direction of T. A. Rickard, has published an immense amount of information about flotation and has given out the following figures, which are astounding when one considers that the application of the process on nothing more than an experimental scale is only a few years old:

Treatment	Tons per annum
Flotation .....	30,000,000
Copper smelting .....	26,000,000
Gravity concentration .....	25,000,000
Gold and silver milling.....	13,000,000
Lead smelting .....	5,500,000
Copper leaching .....	2,000,000
Zinc smelting .....	1,000,000

Of the figures given above, that for copper leaching is perhaps a little low, but it is so much smaller than the figure for flotation that it does not signify. Prior to the adoption of the flotation process in copper concentration the losses were seldom less than 20%, whereas now they are seldom over 8%. The figures published by the Anaconda Copper Mining Co. indicate that the concentration loss in the most modern gravity-concentration plant in existence was 17%; and now with flotation the loss is given at a trifle over 4%. Other large establishments can show equally amazing results. The savings are now so great and the economies so extensive, due to the introduction of the process, that the so-called hold-up by owners of patents on the process cannot possibly cripple the users of the process, even if exemplary damages be allowed by the courts.

The slime problem, the bugbear of copper metallurgists for a generation, has been solved by flotation. Many copper metallurgists will recall the numerous experiments conducted with a view to recovering the values from slime and the enormous sums of money expended in putting up plants that recovered only 60% of the values from these slimes and which were considered marvels in their day. These plants, like the concentrators,

have gone into the discard and now from the most pernicious slimes, savings of 90% of the values by means of the flotation process are quite common.

Strange to say, the process is a rule-of-thumb development. The practical application of the process was first made on an extensive scale with zinc. Copper metallurgists never imagined in those days that the process would ever be applied in their specialty, but today the tonnage treated by the process is largely made up of copper ores, zinc long ago having taken a secondary position.

Each particular ore seems to require a special treatment. This is because no satisfactory theory has as yet been evolved regarding the process. Many students are working on the problem with some promise of success, but at this writing we know less about flotation itself than we do about the true nature of electricity, while the results of the flotation process are as well known as the effects of electricity. Naturally a process creating such enormous profits and handling such large tonnages has produced a great amount of litigation. We have had cases involving millions of dollars tried in various courts and the end is not yet. However, as indicated above, there is money enough in the process to pay for all the litigation and still leave a good return in the investments.

\*A paper presented at the Boston meeting of the American Chemical Society.

## Quality of Tungsten Ores

Frank L. Hess, in a recent bulletin of the U. S. Geological Survey, states that inquiries were addressed to firms known to be reducing tungsten ores, asking what, for their purposes, was the relative desirability of the tungsten-ore minerals, the impurities most hurtful, and the limiting percentages of impurities that would be accepted. Replies were received from eight firms. Of these firms, one reduces its ores by fusing with sodium carbonate, leaching with water, separating tungsten trioxide by hydrochloric acid, and reducing the tri-oxide to a metallic powder; two reduce the ores by other wet chemical processes; two use both the sodium carbonate fusion process and direct reduction in an electric furnace; two use an electric furnace only; one uses processes in which the ores are first treated with wet chemicals and reduction is then completed in an electric furnace. Another firm, the Crucible Steel Co., has in use a number of processes, part of which are covered by the Johnson patents.

By the sodium-carbonate fusion process only powdered metallic tungsten is obtained. One of the other wet chemical processes produces powdered tungsten and another makes powdered ferro-tungsten. The electric furnaces produce only ferro-tungsten.

Most of the processes used for reducing tungsten from its ores also partly or wholly reduce nearly all the metallic and some other impurities in the ores, and these impurities are carried with the tungsten into the steel to which it is added. For such use iron makes no difference, but a number of other elements are not wanted, either because, like copper and phosphorus, they are detrimental to the steel or because, like manganese, if they are wished in the steel they can be added more advantageously in some other way. Objectionable impurities found in tungsten ores are antimony, arsenic, bismuth, copper, lead, manganese, nickel, tin, zinc, phosphorus, and sulphur. Few of these occur in large quantity in ores found in this country. Copper is perhaps the commonest hurtful impurity, and therefore most is said about it, but ores from some foreign countries contain nearly all the impurities mentioned. During the early part of 1916 tungsten ores were so eagerly sought that nearly all offered were bought with little objection to impurities, but under more normal conditions consumers are much more particular.

The wet chemical processes give more opportunity to get rid of impurities than the electrolytic process, so that companies using wet chemical processes are, as a rule, though not uniformly, least particular about the ores they buy. Two of the firms that use wet chemical processes buy tungsten ores almost without regard to the impurities present, but one objects to more than 2% copper, and both buy ores containing as little as 20%  $\text{WO}_3$ .

Only the one firm mentioned is known that does not object to copper in any grade of ore. Another will take

euphriferous ore if 'the content of  $\text{WO}_3$  is sufficiently high.' The others either will not take copper-bearing ore when other ores are to be obtained or set limits of 0.2 to 2% copper and not less than 50%  $\text{WO}_3$ , except that one firm will take ores that carry 5% more copper, for such a percentage will pay for separation. Two companies take ores without regard to impurities other than copper, provided the content of  $\text{WO}_3$  is sufficiently high. Most of the companies object to tin, sulphur, phosphorus, antimony, arsenic, bismuth, lead, and zinc, two of them object to manganese, and one to nickel. The last company referred to set extreme limits of 0.25% for phosphorus, 0.25% for nickel, 6% for manganese, and a trace of arsenic.

As to the different tungsten ore minerals—ferberite, wolframite, hübnerite, and scheelite—two companies using wet chemical processes reported that they made no discrimination; a company using both processes reported that it made no discrimination if the ores carried more than 60%  $\text{WO}_3$ ; one company uses ferberite and scheelite and will not use wolframite or hübnerite; another prefers scheelite but will take any tungsten ore mineral; a user who does not make steel and whose product does not enter into steel also prefers scheelite. Three others gave their estimates of the comparative values as follows (the estimates being stated in the same order): If ferberite can be bought at \$7 per unit then wolframite is worth \$7, \$6.30, \$6.25; hübnerite, \$6.50, \$5.60, \$6.25; scheelite, \$6, \$6.60, \$6.50.

So far as can now be learned, the foreign buyers are quite as various in their demands as the domestic users and are in general more strict in the limits set, and they also demand a purity of 65 to 70%  $\text{WO}_3$ , which means loss in concentration, for ores cannot ordinarily be concentrated to so high a percentage without great waste in slimes.

Brokers are naturally ruled by the consumers to whom they sell and make the same restrictions as to quality of the ores bought.

IN A RECENT PAPER W. Geo. Waring discusses the zinc ores of the Joplin district and gives some interesting notes of the occurrence of rare elements in zinc ores. He states that in 1915, a very observant watchman at the zinc smelter of the Bartlesville Zinc Co., in Oklahoma, discovered globules like mercury that had oozed out in warm weather upon the drusy surfaces of the cakes of lead residuum that had been taken out of retorts used for the redistillation of crude spelter at a temperature of about 350° C. below the highest temperature attained in the ore distillation. He collected a handful of the liquid and submitted it to F. G. McCutcheon, the chief chemist, who found that it gave the reactions of both gallium and indium, and it was later proved to be an alloy of those elements. In 1916, G. A. Buchanan, chemist for the New Jersey Zinc Co., succeeded in proving quantitatively the presence of the extremely rare metal garmanium in Joplin ore, as well as

in some products of zinc metallurgy. Still more recently Waring found thallium in the zinc ores of the Webb City-Carterville district. Practical methods for the extraction of the rarer elements from zinc ores have not been developed. Waring suggests that no particular difficulty lies in the way of separating the cadmium, thallium, and indium, along with copper, etc., in metallic form from the leach liquors of the electrolytic process by cementation upon granulated spelter, while gallium and germanium would concentrate in the electrolyte.

## Prospecting for Platinum

James M. Hill, of the U. S. Geological Survey, gives the following useful suggestions for prospecting. Platinum is not known in all countries, but that all the deposits are known is highly improbable. In fact, platiniferous deposits in southern Spain have been discovered recently by a geologist working on the assumption that the place to look for platinum is in areas of basic igneous rocks similar to the typical Russian rocks. Systematic search, based on similar assumption, in all countries may lead to the discovery of new deposits of platiniferous gravels of economic importance, but a note of warning should be sounded. In Russia such systematic work has been in progress for many years and although new deposits have been found they are not so numerous nor so rich as the hope of the explorers anticipated.

Platinum, both as the native metal and in the form of sperrylite, (platinum arsenide) has been found in basic igneous rocks in several places in the world but not in commercial quantities. The search for the source of platinum in rocks is therefore not likely to be of particular value in obtaining an immediate supply of the metal from lode deposits; it may, however, develop near-by gravel deposits. As already stated, it is confidently believed that any platiniferous ores of commercial grade will yield to the regular analytical treatment in the hands of competent assayers.

The placer deposits containing platinum are all, so far as known, in the vicinity of areas of basic igneous rocks, and it would seem that in any search for new deposits of platiniferous gravels the first step is the search for outcrops of peridotite, pyroxenite, dunite, and serpentine. When areas of these rocks have been found, the gravels of the streams rising in them should be washed to ascertain if platinum is present. The heavy concentrates found in gravels carrying platinum are usually rich in chromite and olivine. The character of the rock particles often gives a clue to the source from which the gravels were derived.

Crude platinum, as it occurs in placer concentrates, is ordinarily a silvery white metal which could be confused only with silver and possibly pieces of iron or steel. It can be distinguished from both of these metals, as they are soluble in dilute nitric acids; crude platinum can be

dissolved only in concentrated aqua regia. In some placer deposits the grains of platinum are coated with a dark film and somewhat resemble the grains of the dark minerals chromite, magnetite, or ilmenite, from which they are separated by careful panning, as the specific gravity of platinum is greater than that of any of those minerals.

Platinum will not amalgamate with quicksilver alone, but will amalgamate if sodium is added. In ordinary quicksilver amalgamation the flakes of platinum float on the surface and can be removed. If sodium amalgam is used, the platinum may be separated from gold by agitating the amalgam with water until all the sodium is used up to form sodium hydroxide; then the platinum will come out on the surface of the amalgam, provided, of course, the amalgam is sufficiently liquid. Platinum has a hardness of 4 to 5, and can be scratched with a knife. It is so malleable that it can be pounded without heating into very thin sheets. It is practically infusible; the grains cannot be melted together, as can particles of gold.

A relatively simple chemical test can be made to determine the platinum. The metallic particles are dissolved by boiling in concentrated aqua regia and the resulting solution is allowed to remain on the stove till dry. The residue is dissolved again in hydrochloric acid and evaporated by boiling till the solution is thick but not quite dry. This mass is dissolved in distilled water and a few drops of sulphuric acid and of potassium iodide solution are added, which, in the presence of platinum, causes the solution to turn a characteristic wine-red, if much of the metal is present, or to a reddish pink in the presence of small quantities of platinum.

The test outlined above is fairly delicate, but it cannot be used to detect traces of platinum in the presence of large quantities of iron or other elements.

A second test may be applied to the aqua regia solution after the resolution in hydrochloric acid outlined above. In this test potassium chloride is added to the solution, which precipitates yellow crystals of potassium platonic chloride, if platinum is present.

These tests are comparatively simple and positive when made on single grains, but they cannot be relied upon when various other elements are present in the material tested. It is, therefore, recommended that their use be restricted to grains of a single mineral picked from the concentrate obtained by panning a sample of either rock or gravel.

THE COMPOSITION of zinc ore concentrate is given by W. Geo. Waring in a recent paper before the A. I. M. E. From numerous analyses the range in average composition of first-grade zinc-blende concentrate is: zinc, 42.10 to 63.09%; iron, 0.9 to 5.97%; lead, 0.06 to 2.86%; lime, 0.15 to 1.64%. For second-grade concentrate the range is: zinc, 48.62 to 58.37%; iron, 2.40 to 6.63%; lead, 0.04 to 3.83%. Galena jig-concentrate ranges in lead content from 73.7 to 81.9%, and table-concentrate from 53.7 to 72.5%.

# REVIEW OF MINING

## CRIPPLE CREEK, COLORADO

CRESSON MINE—ROOSEVELT TUNNEL

A. E. Carlton, president of the Cresson Con. G. M. & M. Co., in an interview announced the discovery of a rich gold-bearing ore-vein, believed to be the extension of the 14th level shoot, on the 15th level of the main shaft. Mr. Carlton said: "It looks as if we have encountered the rich vein that we uncovered some weeks ago on the 14th level, now in the 15th. The ore is running around \$200 per ton and there seems to be an extensive body of it, although we are not yet certain of its extent. However, the recent developments in the mine make it look good."

Light production is resulting from the work in progress at the main shaft of the Elkton Con. M. & M. Co. on Raven hill. Ten groups of lessees are active, and the output is limited to three cars per week of milling-grade ore. The lessees are doing much prospecting, but no new orebodies have been discovered. Dump lessees are shipping from 2 to 4 cars per week of low-grade ore.

The Komat Mining Co., Math Korf, president and general manager, has re-timbered the shaft of the Victor mine, on Bull Cliffs, to the 900-ft. level, and has started to pump the seepage water from the bottom level, at 1000 ft., preparatory to exploitation at that depth. Since shipments commenced, the leasing company has delivered 15 cars of ore, six during the present month. Settlements have ranged from \$14 to \$18 per ton. The property is owned by the Smith-Moffat Mines Co., of Denver.

The Big Toad Gold M. & M. Co., E. A. Chapman, manager, operating the Dante mine on the south-western slope of Bull hill, under lease from the Dante Gold Mining Co., is engaged in overhauling the Reid mill, recently acquired by purchase, and will handle low-grade mine and dump-ore.

The Raven & Beacon Hill G. M. Co. has extended the lateral from the Roosevelt tunnel of the Cripple Creek Deep Drainage & Tunnel Co. into its ground, 17 acres of the Aregua townsite on Raven and Beacon hills, a distance of about 225 ft. The vein under development is a strong one, but the assays have been low. The work is being watched with interest.

The Roosevelt tunnel was advanced 78 ft. in the first 15 days of September and the heading is now in a dense breccia. The ground is breaking well. The heading is now in the Big Banta claim of the United Gold Mines Company.

The Acacia Gold Mining Co. is engaged in cutting a station at the new 1450-ft. level of the South Burns shaft. Shipments from the upper levels continue and the company and lessees are shipping about 100 tons of ore per week, ranging from \$18 to \$30 per ton in value.

The following officers and directors were elected at the annual stockholders meeting of the Blue Flag Gold M. & M. Co., held recently at Denver: J. F. Erisman, president and general manager; Joseph J. Gunnell, vice-president; J. S. Pigall, secretary-treasurer; W. B. Warren, assistant secretary and treasurer; directors, Joseph J. Gunnell, J. S. Pigall, J. M. Heaton, D. A. Schaffnit, J. M. Burkhart, J. F. Erisman, and George W. Duke. The company has resumed operations on Raven hill and is sinking the main shaft from the 1100-ft. to the 1400-ft. level. The Blue Flag G. M. & M. Co. is also

operating the Laurium group in Summitt county, and the Yellow Jacket placer in Idaho.

## VANCOUVER, BRITISH COLUMBIA

ELK VALLEY COAL AREA.

While it is an undoubted fact that the coal mines of Vancouver island are capable of much greater production and that there will probably be no great difficulty in supplying future demands for some time to come, considerable importance is attached to new and undeveloped coal areas that have been the subject of recent investigations. British Columbia's coal consumption is increasing, the supply of fuel oil is threatened and if cut off would have to be replaced by an additional million tons of coal per year. New industrial plants are springing up, commerce is increasing, and after the War there seems reason to anticipate a greater development than ever.

In view of these facts it appears not at all unlikely that the undeveloped coal resources of the Province will be utilized. A report just issued by the Geological Survey of the Dominion Department of Mines states that practically the whole of the Upper Elk valley is occupied by a coal basin and that the thickness of workable coal is large. The coal of the Upper Elk valley is similar to that of the Crowsnest coalfield, which is mined at Michel and Fernie. It is bituminous and is a good coking coal. The coal occurs interbedded with sandstone and shale, and the series as a whole is referred to the Kootenay formation. The thickness of the formation in Green Hills is approximately 3500 ft. This is much greater than that reported for the same formation in other areas.

In Elk valley the first coal is in the 'Green Hills, which reach an altitude of 3000 ft. above the valley. Several coal-seams of workable thickness outcrop. A section measured shows 89.5 ft. of coal in twelve seams. The formations strike with the trend of the ridge and can be seen outcropping for several miles to the north. The next coal-outcrops are about seven miles farther north at what is locally known as the Canadian Pacific Railway headquarters' camp. Here are two coal-seams, 10 and 15 ft. thick, separated by 125 ft. of sandstone and shale, on the west slope of the Green Hills. Prospect adits have been driven on them.

Aldridge creek cuts across the strata and a number of coal-seams are exposed. Prospect adits have been driven in six seams. The combined thickness of the six is not less than 50 ft. One seam is 15 ft. thick. Two and a half miles north of Aldridge creek at Weary Creek camp an adit has been driven across the same measures and is reported to have cut seven workable coal-seams of an average width of nine feet. One seam at the surface measures 15 ft. in width. Opposite Weary Creek camp on the west side of the Elk river, the coal measures are well exposed on Bleasdel creek. About 20 seams of coal are in evidence, varying in width from a few inches to 30 ft. Several are of workable thickness.

North of Weary creek the valley narrows and for the last 12 miles before the summit is reached the limestone mountains rise steeply on both sides. A thick coal-seam is reported to occur along the river five and a half miles north of Weary creek, but was not seen by the geological survey party.

On ascending Fording river the first coal is encountered at

Ewin creek, a tributary from the east,  $12\frac{1}{2}$  miles north of the junction of Fording and Elk rivers. On the south side of Ewin creek the Imperial Coal & Coke Co. has driven adits on six seams, three of which are more than 10 ft. thick. Prospect-pits on the hills indicate several more seams. These lie on the east arm of the syncline between the north arm of the Wisukitshak range and the main range of the Rocky Mountains. They were not followed southward, but to the north they follow the ridge east of the Fording for 13 miles, then cross the Fording and connect with the coal on Aldridge creek, as previously described. Prospect-drifts have been driven on three seams where they cross the Fording river, but were so badly caved that the thicknesses could not be measured.

The information that has been compiled thus far by the geological survey was obtained during a hurried trip through the valley. There were no prospectors in the field from whom guiding information could be obtained and most of the time was spent along the main trails and at the easily reached prospects.

The mining of the coal can be accomplished without serious difficulties. The methods employed on the pitching seams of the Crownsnest district can be applied here. The valleys of Elk and Fording rivers offer easy routes for railways and connections can be made with the Canadian Pacific and Great Northern railways at Michel or with the main line of the Canadian Pacific railway to the north. At present a good wagon-road leads from Michel up Elk river to Weary Creek camp, a distance of approximately 45 miles, and the other parts of the district can be easily reached by pack trail.

## MARIPOSA, CALIFORNIA

HORNITOS DISTRICT.—PRINCETON.—MERCED RIVER DISTRICT.

A good deal of fresh activity is reported. In the Hornitos district the Mt. Gaines is walling off the water on the 900-ft. level and extracting ore on the 500. The water now being pumped is delivered to the Ruth Pierce, where a full crew is employed and 30 tons of ore is being stamp-milled daily. The Castanet mine is sinking the main shaft and will build a small mill to treat its small output of high-grade ore. On the Mariposa grant a good deal of work is being done by lessees. Of these, one party is operating the Long Mary mine and mill, but operations are restricted by the amount of electric power obtainable from the Bagby plant. The lessees on the Queen's Specimen, near Bagby, have finished a 300-ft. tunnel and cut ore 9 ft. wide. It is said to be rich. The Trabuco boys are milling ore from the upper levels of the old Pine Tree and it averages over \$20 per ton for the 10 tons per day. The dumps on the Pine Tree and Josephine are being hauled to Bagby and milled there in the old Mariposa company's mill. It is reported that 240 tons averaged \$5.20 per ton. About 300 tons remains to be treated. The Princeton mill is being prepared to treat the output of the Mt. Bullion district. The new company has made the first payment of \$75,000 on the purchase of the Mariposa grant, but a lack of working capital appears to restrict new operations. In the Merced River district, the White Oak is being operated by A. E. Rau-Roesler of New York. A new electrical equipment is being erected; a hoist and new compressors have been bought. The intention is to sink 250 ft. and drive 1000 ft. on the vein, which is 4 ft. wide and averages \$8 per ton in gold. The Original mine, on the Merced river, is working full time in both mine and mill, paying dividends of \$2000 per month during the current year. The Mountain King, after much trouble in getting a crew, is operating full time, milling ore from the 1400-ft. level that averages \$7 per ton for 60 tons per day. In the Coulterville district, the Champion is getting ready to add an electrical equipment. The San Joaquin Power Co. is running a line to this mine and new equipment is to be purchased. Meanwhile extremely rich

ore is being mined on the 300-ft. level. The White Gulch Mining Co., operating the Virginia mine, is employing 22 men and extending the drift on the 700-ft. level. Ore for the 10-stamp mill, treating 30 tons daily, is being taken from the 300 and 500-ft. levels. A new hoist has been erected and the enterprise is being operated with notable efficiency. The Gray Eagle has installed pumps and is getting ready to operate. The Mary Harrison is idle.

## AUSTIN, TEXAS

DEEP POTASH EXPLORATION.

George Otis Smith, director of the U. S. Geological Survey, in responding to an inquiry as to what research work that department was doing in Texas and the South-West, makes particular reference to the potash explorations that are being conducted. He says:

"The search for potash in the Panhandle or north-west Texas will be continued. The well now drilling at Cliffside, seven miles north-west of Amarillo, for the purpose of proving the presence or absence of potash salts in the Permian formations of that area has now reached a depth of over 1700 ft., without, however, encountering potash in important amounts. It is hoped that the hole may be carried to a depth of 2300 ft. or more. Meanwhile the studies of the rocks in the Red Beds basin of north-eastern New Mexico, northern Texas, and western Oklahoma with the object of determining the centres of greatest saline deposition, so far as that is possible from surface criteria, will be continued by N. H. Darton. The study of the occurrence of salt and potash deposits in the Permian Red Beds of Europe encourages the hope that somewhere in the great Red Beds area of eastern New Mexico, western Texas, western Oklahoma, western Kansas, and eastern Colorado and Wyoming deposits of potash salts, probably lenticular in shape and restricted in geographic extent, but perhaps profitably workable or even as valuable as those in Germany, may somewhere be found. An earnest realization of this hope is to be seen in the tremendous thicknesses of rock-salt reported in some of the wells drilled for water and oil. It is a misfortune that chemical tests for potash were not made of the saline deposits and of the brines encountered in most of these wells. All the strata, including the gypsum, anhydrites, and clays, as well as the salt-beds cut by the drill at Cliffside, have been chemically tested on the spot by R. K. Bailey, chemist, who also has from time to time visited other wells operating in eastern New Mexico and western Oklahoma for the purpose of testing the drill-samples taken from the wells and held for his inspection through the courtesy of the operating companies. It may be that a number of wells will be bored by the Government or by private interests seeking oil or water before potash salts in profitably workable beds are finally discovered in this great basin. However, the conditions of deposition, including the character of the sediments, the precipitation of vast amounts of salt, gypsum, and anhydrite, and even the conditions of shallow water and aridity were so similar contemporaneously in the Stassfurt district of Germany and in the great Red Beds region of the West that the presence of potash deposits in the latter may be tentatively predicted on the law of probability."

MANGANITE is a black brittle massive or crystalline mineral with a reddish-brown or nearly black streak. It has a specific gravity of 4.2 to 4.4, a hardness of 4, and a theoretical content of 62.4% metallic manganese and 10% water. It occurs generally with psilomelane in alternating layers in botryoidal masses. In such masses it consists of numerous needles that radiate from the walls toward the middle of the vein. Psilomelane is a black or steel-blue mineral of specific gravity 3.7 to 4.7. Its chemical composition is not definite.—U. S. Geological Survey.

## ARIZONA

### COCHISE COUNTY

(Special Correspondence.)—Machinery is being overhauled and buildings repaired at the Central Butte mine, three miles from the Commonwealth. The work is in preparation for dewatering the 180-ft. shaft for further sinking. W. J. Anson of Los Angeles examined a tungsten property near Dragoon and purchased an interest in it. Machinery is now being shipped from Los Angeles and operations will start at once. The Arizona Binghamton output for September is expected to be in excess of the previous month. A new unit was recently added to the mill, increasing the capacity to 250 tons per day. A carload of high-grade ore per day is being shipped. Diamond-drills will be used for prospecting the lower levels. The Nelson mine is now producing and shipping 125 tons of ore per day to the plant of the Bradshaw Development Co. As a result of four years of development much ore is in reserve. The ore is complex and is treated by flotation.

Bisbee, September 15.

The Shattuck-Arizona, Bisbee, is developing deposits of lead-zinc sulphides. A concentration-plant will be constructed.

### GILA COUNTY

(Special Correspondence.)—Operations in the Globe-Miami district are rapidly approaching normal. The Old Dominion has 700 men working. Miami has just about as many, and half of its mill is in operation. Four sections of the Inspiration mill are in operation. The International smelter expects to resume. The Ray Hercules has been able to push its construction work with such rapidity that the mill will be in operation by the first of the year. The initial capacity of the mill will be 1500 to 1800 tons per day. There is a reserve of 10,000,000 tons of ore. The Sulphide Copper Co. has been organized to develop 37 claims 12 miles from Globe in Russell gulch.

Globe, September 17.

### GREENLEE COUNTY

(Special Correspondence.)—It is rumored that the Phelps-Dodge interests are contemplating the purchase of the Arizona Copper Co., now controlled by Scotch capitalists.

Clifton, September 10.

### MOHAVE COUNTY

(Special Correspondence.)—The Rico Mining Co., Robert W. Wilde, president, leased and bonded the C. O. D. silver mine. The old mill is to be re-constructed and the mine re-opened. W. J. Hennessy is superintendent. In the New Mohawk, a 4-ft. vein of silver ore was cut in No. 2 shaft, 150-ft. level. A larger hoist will be installed and sinking resumed. The New Tennessee has resumed sinking and the shaft will be continued to the 500-ft. level. Four feet of milling-ore has been opened in the north drift, 240-ft. level. The Copper Age mill is in operation. The mine continues to develop ore-reserves on the upper adit-level. Final payment was made on the Tuckahoe. The shaft is down to 250 ft. On the 200-ft. level of the Diana an orebody four to six feet wide and averaging \$20 per ton in gold and silver was opened. The Bullion Hill shaft is down 280 ft. Cross-cutting will begin at the 300 level. Several feet

of ore was discovered in the south drift of the Schenectady upon the 175-ft. level. Ore is being broken in both drifts for shipment. The Rattlesnake is still mining ore of shipping-grade. The Chloride Queen has installed new hoisting machinery.

Chloride, September 6.

(Special Correspondence.)—The C. O. D. mine, consisting of 15 claims, has been purchased by the Rico Con. Mining Co., which is headed by Robert W. Wilde, of the Desert Power &

ARIZONA

Water Co. The C. O. D. mine is 12 miles north of Kingman. The property has been worked by a number of lessees in the past. Work has been started on re-modeling the mill and preparations are being made for the unwatering of No. 2 shaft, 350 ft. in depth. The New Mohawk has reached 60 ft. in shaft No. 3, and rich silver ore has been encountered. An assay of ore, not including a high-grade streak, gave a return of \$53. The sorting-tables have been completed at shaft No. 2, and all ore is being sorted. The final payment has been made on the Tuckahoe. The new shaft has now reached a depth of 200 ft. Lessees, operating the Cornish property which adjoins the New Mohawk, have sunk the shaft to 80 ft. Samples assay \$7 in gold and several ounces in silver per ton.

Kingman, September 14.

## NAVAHOE COUNTY

(Special Correspondence.)—Coal declarations have been filed at the U. S. Land Office at Phoenix. Nineteen have been filed by men from Holbrook.

Holbrook, September 15.

## PIMA COUNTY

(Special Correspondence.)—The Mile Wide Copper Co. has entered into a contract with the Sasco smelter and will ship four cars of ore per week. The ore will average 8% copper. The development has reached 325 ft. in depth and cross-cuts have been extended at each 100-ft. level. The orebody is from 22 to 28 ft. wide. The first payment on another group of four claims has been made and a lease on the Copper Plate claim taken by the same company. The Cornelia Copper Co. has contracted with the Southern Sierras Power Co. for 2000 kw. to be delivered at Ajo. A line will be constructed from Yuma to Ajo, the contract calling for power delivery within 18 months. The Dos Cabezas Gold Ridge Mining Co. is developing ore at the Gold Ridge mine. The company contemplates erecting a mill. The Mascot mine of the same company shipped 75 cars of ore in August. More machinery is being installed at the Mascot and a larger force of men is being put on.

Tucson, September 17.

A 50-ton custom smelter will be built at Ajo by H. R. Haines, I. J. Tolinski, and J. W. Mayes.

The New Cornelia Copper Co., Ajo, will install several additional precipitation tanks at its leaching-plant.

The Hecla-Arizona Copper Co., Twin Buttes, is preparing plans for a large leaching-plant.

## PINAL COUNTY

(Special Correspondence.)—The Silver King has now been equipped for pumping, and dewatering has commenced. The management expects to be able to start shipping ore by October 15. Developments on the Fortuna Consolidated continue to improve, and it is expected that shipments of copper ore will soon be made. Work has been resumed on the Camelback Gold & Silver Mining Co.'s property. E. F. Gordon of the Primos Chemical Co. is making an examination of the Mohawk mine in the Mammoth district.

Florence, September 15.

The Ray Hercules M. Co. contemplates the installation of electrical equipment, a crusher, and a 1200-ton concentrating plant.

## YAVAPAI COUNTY

It is stated that the General Development Co., Jerome, has appropriated \$500,000 for the purchase and installation of machinery and the development of its property.

The Copper Queen Mining Co., Mayer, will construct a flotation-plant.

(Special Correspondence.)—Operations by the Arkansas & Arizona company have ceased. The controlling interest is held by the Goodrich-Lockhart Syndicate. Pumping and re-opening the property was started a year ago and \$250,000 spent in development and improvement. A complete report of the affairs of the United Verde Copper Co. has been forwarded to the Corporation Commission by Eugene M. Barron, who was appointed manager recently. The directors felt that if the commission approves its present plan of raising more money they will make the mine a copper producer. The Shannon Copper Co., which took over the Yaeger Canyon mine, 8 miles south of Jerome, has opened up ore in cleaning out the old workings. A \$30,000 electric plant is being installed. The power-line of the Arizona Power Co. crosses the Yaeger property.

Jerome, September 10.

The Pocahontas Copper Co., W. H. Skinner, president, is con-

templating the erection of a flotation mill at its mine, two miles south-east of Mayer.

## YUMA COUNTY

(Special Correspondence.)—The shaft of the Black Giant Mining Co. was sunk 160 ft. in August. The equipment used was a 25-hp. Fairbanks-Morse hoist, Ingersoll compressor and jack-hammers. The property was taken over in April by D. W. Hale and associates of Mobile, Alabama. W. Tovote, of Tucson, is making an examination of the property.

Yuma, September 15.

(Special Correspondence.)—Lessees on the Bullard property in the Cunningham Pass district shipped their first car of ore last week. They are said to have a moderate tonnage of high-grade ore. An adit on a vein from which 80 cars of ore had been shipped was extended to a length of 400 feet.

The Wenden King is operating on a double-shift basis and is sinking a shaft. The Black Reef is sinking and has almost reached the 500-ft. level. At the Black Giant, air-drills are being used and the Gosson vein will be prospected at a depth of 500 ft. Boston people have taken over a mining property near the Socorro mine. They have organized a company which is called the Harqua Hala Ridge M. & M. Company.

Wenden, September 16.

## CALIFORNIA

## AMADOR COUNTY

(Special Correspondence.)—The Bunker Hill Mining Co. at Amador City has a flume in course of construction, extending on trestles from the mill or slime plant to the tailing dam on Rancheria creek. The flume will carry the waste from the mill to and along the line of the dam, and the material itself will thus be used to strengthen the concrete restraining barrier.

The California Clay Corporation, which has acquired a large tract of land near Ione and has plans made for the development of the clay deposits there, has been hampered by financial conditions, but active operations are expected at an early date.

Pending the completion of plans for handling its large deposits of low-grade ore, the South Eureka Co. laid off its employees, with the exception of those necessary to keep the mine open and in repair. The Oneida mine is not affected.

Sutter Creek, September 15.

A copper mine west of the Allen copper mine is being reopened by F. W. Ruhser, J. Strohm, and A. Huberty of Jackson.

Wm. Hooton and J. R. Tiernan have leased a tailing-dump near Forest Home and will begin the erection of a treatment plant.

## NEVADA COUNTY

The Golden Center mill is receiving ore from the 500 and 700-ft. levels and will resume operations within a short time.

## PLUMAS COUNTY

(Special Correspondence.)—Under B. R. Binns, as manager, Nevada people have begun work on a group of copper claims adjoining the Engels mine. A camp has been established and work will soon start on a 3000-ft. adit. The Engels Copper Co. is steadily increasing the capacity of its flotation mill and developing areas of outside ground.

The Juneday Mining Co. has arranged for the resumption of work with F. D. Searight as manager. Cleaning out of the old tunnel has begun and by the end of fall development will start. The Juneday is a gold-quartz mine near Crescent Mills.

The Noble Electric Steel Co. has completed a 1½-mile road from the Burch manganese mine in Round valley to the recently acquired group of manganese claims above Indian Falls, and is about to start regular shipments. From its Braitto mine this company is shipping two cars of manganese ore per week, and is prospecting numerous properties in the vicinity

of Indian Falls and Greenville. From the Crystal Lake manganese group, on the summit of Mt. Hough, Allen & Robinson are shipping several tons per week to the Heroult smelter, and opening one of the best deposits yet found. The property is five miles east of Indian Falls and is owned by Myton & Kloppenberg of Quincy.

Indian Falls, September 26.

The Engels Copper Co. proposes to file an application before the Commissioner of Corporations for permission to issue 167,686 additional shares of capital stock. The company will use the money derived from the sale of the stock to defray the expenses of the first unit of the new mill and the tramway and for the construction of another 750-ton unit which will be built early in 1918. A two-mile adit, a three-compartment shaft, and the construction of a hoist are also planned.

#### SAN BERNARDINO COUNTY

The Valley Wells smelter will soon be in operation; the delay in the completion of the plant being due to the congested condition of the railroads, and the failure to deliver some of the machinery on time. The plant will treat custom-ores as well as ore from the Copper World mine which is being operated by the same company. There are many thousands of tons blocked out in the mine and the old dumps are being worked over. Enough ore is in sight to run to capacity for three years. This company has taken over the Francis mine for its supply of sulphides.

A shipment of platinum ore from the West End mine was made to the Pacific Platinum Works in Los Angeles, the assay of this shipment was: gold 1.56 oz., silver 5.10 oz., lead 54.3%, platinum 3.57 oz. per ton. Arrangements are now being made for the marketing of the ore. In the development now being done for determining the extent of the platinum ores, a body of high-grade lead ore was opened. A 10-ton dry-concentrating plant is to be erected for the treatment of the lower grades of ore. The Standard mine is making regular shipments of high-grade copper ores. This property, idle 10 years, shows promise of again becoming one of the large producers of the district.

Calico, a once noted silver-mining district, is showing signs of activity under the stimulus of the prevailing high price of silver.

#### SHASTA COUNTY

The El Oro Dredging Co. is prospecting the Menzel ranch. The acreage lies north of Redding, directly across the Sacramento river.

The Gardella Dredging Co. is constructing No. 2 dredge for operation on ground adjoining the area now being worked by No. 1.

The Old Diggings mining district is active and gold-bearing ore is being shipped to the Mammoth smelter.

The Shasta Hills Co. is developing the Sybil mine. A 5-stamp mill and concentrator has been erected.

The miners strike is practically over. The Mammoth, Iron Mountain, Balaklala, and Hornet mines are in operation with reduced forces.

#### TUOLUMNE COUNTY

(Special Correspondence.)—The Wonder mine has been purchased by E. G. Blake, and work started in the 50-ft. shaft. The vein has an average width of 3 ft. and assays are from \$4 to \$108 in gold per ton.

Chrome ore is being shipped from the western part of the county, most of it being loaded on cars at Jamestown and Chinese Camp. Buyers are in the field almost every week. A few stamps of the Shawmut mill are once more in operation, after being hung up for several months. For some time work has been confined to the development of the property and to making improvements.

The McAlpine mine, near the southern boundary line of the

county, is being worked and it is said that the outlook is much more promising than at any time in the past. The shaft is to be deepened, and the operators are now seeking additional men. The return from the gravel milled and washed at the Buckeye mine, on Table mountain, since the beginning of milling and washing operations three months ago, is reported to have been fair. A flow of water was tapped in the mine recently, causing the men to rush to surface to save their lives. An air-compressor and other machinery have been installed at the Keltz, and under the direction of G. E. Cheda, superintendent, development work will be pushed.

A two-stamp mill has been installed on the A. C. Smith claim near Chinese Camp. The claim was recently leased to Pearce, Rowe, and others. The lessees report the finding of rich ore. The shaft at the Yosemite mine, adjoining the Rawhide, has attained a depth of 500 ft. After cutting a station a cross-cut will be driven.

Sonora, September 15.

### COLORADO

#### BOULDER COUNTY

(Special Correspondence.)—The lessees on the Scroglund mine are steadily producing tungsten ore. The Boulder County Tungsten Production Co. has let a 700-ft. contract to O'Day Bros. The company has completed its refining plant and is now directing its attention to the exploitation of its mineral area. The Huron mine, president R. T. Shaw of Holton, Kansas, and G. M. Woodring of Eldora, manager, is producing rich gold ore and is planning a milling plant at an early date. The Consolidated Leasing Co., of which C. E. Kohler is president and manager, has perfected plans for the erection of a mill. The company has large orebodies on Spencer mountain. The Ludlow mill at Lake Station is being completed, and is expected to be ready for operation in the near future.

The Primos Chemical Co. is planning the erection of a mill for the treatment of molybdenum ores in the Daily district.

Eldora, September 15.

#### TELLER COUNTY

The plant of the Lost Dollar mine is being re-built and mining operations are expected to begin late in November.

### IDAHO

Investigations of the treatment of ores which was begun this summer by the U. S. Bureau of Mines in co-operation with the School of Mines of the University of Idaho is expected to stimulate metallurgical progress in the North-West, according to C. A. Wright, head of the Bureau of Mines at Moscow, Idaho, and Francis A. Thomson, dean of the School of Mines. The co-operation has been made possible by generous contributions from some of the mining companies in the Coeur d'Alene district.

The work at Moscow is to be carried out in the School of Mines' laboratories under the direction of C. A. Wright, with Thomas Varley, superintendent of the North-West Bureau of Mines station, as supervising metallurgist. The staff at Moscow, in addition to Mr. Wright, consists of an analyst and two research men.

Special emphasis is to be placed upon differential flotation as applied to ores containing lead, zinc, and iron minerals. It is also planned to study processes and methods of treatment that might be applied to the low-grade ores which cannot be profitably concentrated by the methods now in use.

The Consolidated Interstate-Callahan Mining Co. produced 15,005 tons of ore in August. An average of 14,400 tons per month was made for the quarter ended in June. Shipments during August aggregated 5226 tons of zinc and 951 tons of lead product, a total of 6177 tons. The product contained 47% zinc, 46% lead, and 18 oz. of silver per ton. Before concentra-

tion the ore averaged 21.5% zinc, 7.2% lead, and 3 oz. of silver per ton. The installation of an additional mill-unit will be completed soon. The unit is equipped with flotation-cells and is expected to handle greater quantity of ore and increase extraction.

The Richmond M. M. & R. Co., operating in Shoshone county, has declared its regular monthly dividend of \$16,800, at the rate of 2 cents per share. Payment will be made October 5. The total of disbursements is \$54,000.

The Douglas Mining Co. of Wallace has declared a dividend of one cent per share. The Douglas mine is under lease by the Anaconda C. M. Co. which pays a royalty of \$3 per ton of ore shipped.

The Con. Interstate-Callahan M. Co. has suspended its dividend for the current quarter. The war tax is the chief reason for withholding the dividend. The earnings for the third quarter were \$461,000, an equivalent of one dollar per share.

The Armstead mines on Lake Pend Oreille will be developed by the Silver Hill Mining Co. The installation of a compressor and a concentrator is contemplated.

#### LEMHI COUNTY

C. W. Sherwood of Salmon will install a cyanide plant on the Gold Dyke. Plans have also been made to install an electric power-plant on the Salmon river to supply current for the electrolytic treatment of the zinc ores of the Gold Dyke.

### MONTANA

#### DEERLODGE COUNTY

At the Washoe smelter, four sections of the concentrator are in operation. One blast-furnace, 5 reverberatories, and No. 2 roaster building are also in operation.

#### LINCOLN COUNTY

The Snowstorm Consolidated, at Troy, has been milling ore at the rate of 7000 to 8000 tons per month during June, July, and August, according to Leo Greenough, president and manager. Production has been curtailed owing to a shortage of underground labor but conditions in this respect are improving.

#### SILVER BOW COUNTY

Resumption of work at the Anaconda is steadily taking place. Over 4000 miners are at work.

### NEVADA

#### CLARK COUNTY

The Los Angeles Platinum Co. is constructing a plant at Los Angeles for the treatment of ore from the Boss mine.

#### HUMBOLDT COUNTY

The Seven Troughs Mining Co., at Fairview, is extracting high-grade ore and shipping to the Darby mill at Mazuma. It is said that the erection of a mill is being considered.

#### MINERAL COUNTY

The Pilot Copper Co. has resumed work on a 200-ton leaching plant.

The Luning-Idaho company will start shipments from the McDavitt shaft as soon as the second unit is put into operation at the Thompson smelter.

Rich copper ore has been struck in the Calavada on the 1000-ft. level.

It is stated that the Nevada Rand Co. has definitely decided upon the construction of a 10-stamp mill.

#### NYE COUNTY

(Special Correspondence.)—The Tonopah Belmont during the past week shipped 49 bars of bullion valued at \$97,823 and concentrate valued at \$12,400 from the Belmont mill, and 22 bars of bullion worth \$44,200 and 31 tons of concentrate worth

\$12,400 from the plant at Millers, making a total of \$166,823 for the two mills. Raise 44 on the 900-ft. level continues on the South vein with a 4-ft. width. The intermediate east drift on the 1100-ft. level reached the foot-wall of the Belmont vein. South cross-cut 20 on the 1166-ft. level intersected a branch of the Mizpah fault vein, and it shows good assays. The tonnage of the past week was 2692 tons.

The Tonopah Extension, during the last part of August, shipped 25 bars of bullion valued at \$54,000. The station on the north side of the Victor shaft on the 1680-ft. level is complete, and a cross-cut into the unexplored ground to the north will soon be started. In the No. 2 shaft, 24 ft. of development was made, and in the Victor 120 ft. On the 1440-ft. level of the Victor, the Murray vein has a width of six feet and the O. K. three feet. The tonnage the past week was 2380 tons.

The Sandgrass territory of the Tonopah Mining Co. is still idle due to the re-timbering of the shaft. In the Silver Top, 54 ft. of progress was made and in the Mizpah, 29 ft. The Burro and the South Dipping veins both show a 4-ft. face of milling ore. The tonnage the past week was 2200 tons.

The West End mill shipped 28 bars of bullion valued at \$54,457 for the first half of September. In the Ohio territory of the West End, cross-cut 527 has been started. Cross-cut 680, No. 2 of the West End, has continued to advance under the vein; 717 D. No. 2 is advancing in low-grade vein material. At the Halifax 1704 and 1256 cross-cuts have advanced at their usual rate.

The south cross-cut from the 900-ft. level of the Desert Queen shaft of the Jim Butler Tonopah Mining Co. cut a small stringer of mineralized quartz. Raise 368 has a 4-ft. face of fair ore on the Wandering Boy vein. The tonnage the past week was 900 tons.

The Monarch Pittsburg Mining Co., since the visit of president H. C. Brougher, has started a more active campaign of development. Raising on the vein from the 850-ft. level will be started to develop the orebody.

The Rescue-Eula produced 128 tons of ore the past week, the Cash Boy 40 tons, and the lessees at the Montana 327 tons, making the week's production at Tonopah 9521 tons with a gross value of \$166,617.

Tonopah, September 18.

(Special Correspondence.)—Tonopah operators have agreed to pay a minimum wage of \$5 per day to miners, and have waived the original stipulation of 20 days of continuous employment before a worker could command the increase of 50c. daily. The offer of the operators was accepted by the men by a vote of 402 to 317. In some quarters dissatisfaction is expressed but the more conservative miners and millmen are in favor of the agreement.

It is reported that the MacNamara mine will resume work in a few days and that the mill will be operated on ore from the upper workings, where a large tonnage is blocked out. This product was formerly unprofitable, but with \$1 silver can be mined to advantage. It is also rumored that the Montana company is contemplating resumption of operations at its mine and mill, and that other companies are planning early activity.

The Round Mountain Mining Co. is repairing the Fairview mill and expects to start work at the Fairview mine. The mine adjoins the Round Mountain group and was acquired by the company several years ago. Activity prevails at the Round Mountain quartz and placer mines. L. D. Gordon is president and manager.

Several properties in outside districts have started ore-shipments to Tonopah mills. They are the Louisiana Consolidated, at Tybo, the Confroth, at Bellehellen, and other old producers. Production has been greatly stimulated by the advance of silver and from present indications all the Tonopah mills will be taxed to capacity to take care of shipments.

Difficulty in securing motor trucks is interfering with shipments, and mule-teams are also difficult to secure. Manager Joseph Confroth of the Confroth company reports that he has been unable to secure enough trucks, as all the manufacturing companies are engaged in supplying Government demands.

Prospecting of silver deposits is active at Gold Mountain. H. D. King of Tonopah has uncovered small shoots of rich ore on the Jew and Jewess claims and is preparing for deeper work. Tonopah, September 24.

(Special Correspondence.)—The Tonopah Extension Co. has satisfactorily tested its new auxiliary electric-power plant. It develops 500 kw. and will be used to operate the Extension mill, the pumps in the Victor shaft, and other equipment whenever the usual source of electric power fails. Cross-cutting to the south from the 1630-ft. level of the Victor shaft has begun, the object being to pick up the Murray, North Merger, and other veins. Another station is being completed on the north side of the shaft preparatory to cross-cutting from this point.

Claude Marvin, Walter Vickers, Charles Kielhofer, and other Tonopah men are developing a group of claims in the Gold Reef district, south of Tonopah. A shaft is down 75 ft. and is in ore showing free gold. At the surface the vein is 14 ft. wide.

The rise of silver has stimulated the re-opening of properties at Barcelona. The Consolidated Spanish Belt Co., F. Pike, superintendent, has driven an adit 350 ft. and has discovered ore. A compressor, machine drills, and other equipment have been installed. The shaft of the Stimler mine, at Cottonwood, is down 445 ft. and the ore is being tested. A six-drill compressor and 40-hp. semi-Diesel hoist are in operation and, on the 165-ft. level, 12 men are stopping ore. Cross-cutting from the bottom of the shaft is about to begin. Harry Stimler is superintendent.

Tonopah, September 16.

The Tonopah Mining Co. has discontinued its exploration department. J. E. Spurr stated recently that, at a total cost of \$261,108, the exploration department had yielded results to the extent of \$7,358,600.

#### ORMSBY COUNTY

(Special Correspondence.)—The Univeda Gold Dredging Co. has taken a five-year lease on the Brunswick and Merrimac property of 400 acres and is preparing to install a dredge to recover the gold and silver from mill-tailing in the Carson river near Brunswick, six miles from Carson City.

The Bessemer Con. Mining Co. has completed preparations for mining iron deposits in Brunswick canyon, four miles south of Brunswick. The upper adit is in 200 ft. and has cut several iron-bearing veins, of which the main orebody shows a width of 17 ft. of ore. Adit No. 2, 150 ft. below No. 1, is in 500 ft. and a raise is being extended to develop the main vein. A five-ton motor truck will be employed to haul ore to the railroad station for shipment to San Francisco.

Orin H. DuBois is developing silver ore in the Washington-Nevada, 10 miles north of Carson City.

Carson City, September 27.

#### WHITE PINE COUNTY

(Special Correspondence.)—The Nevada Consolidated is mining 13,000 tons of ore per day. Being unable to renew satisfactory contracts for fuel oil, a plant is being erected at the smelter for the storage and crushing of coal to dust, which is to be used for smelting and the power-plant. It is being constructed of concrete, as structural steel cannot be obtained. It will cost \$400,000, and will be completed at the end of the year, when the oil contracts expire. Several steam-shovels at work on overburden have been laid off.

The State and Federal authorities requested that all their labor must be on an 8-hour basis, and this went into effect on

September 1. Heretofore most of the open-pit mining was done on 9, 10, and 12-hour shifts. During the last two months the company has paid all employees 50c. per day more than the scale controlled by the price of copper; at the pit the men are paid for nine hours, although working only eight hours. The men are charged \$25 per month for board, no change having been made for several years either in food-quality or price. The men are also furnished rooms, with heat and lights free; married men are given houses at very low rentals.

Robert Linton has been made manager and consulting engineer of the Consolidated Copper Mines Co., at a recent directors meeting. A smelter-site has been selected by Linton near the old Giroux shaft and construction will be started next year. Equipment for the stripping of the Morris orebody is coming, and work will be started within 60 days. The development in the Alpha continues in high-grade ore. Shipments from the 10th level of the Giroux shaft assays from 10 to 12%.

The Delkir mine, in Elko county, 29 miles west, is shipping copper ore from Currie station. Additional ore will be mined but, after the developed ore has been exhausted, further mining is doubtful as the vein is badly faulted, and the continuation has not been discovered.

The Ward mine, S. B. Elbert of Denver in charge, is making preparations for regular shipments. It is 18 miles south of Ely. Two White auto trucks and trailers and three 'cub' tractors and accompanying trailers, manufactured by the J. I. Case Plow Co., have been received and will be used for haulage.

The lessees on the Hunter mine, 18 miles south-west of Cherry creek, have been unable to make a satisfactory engagement with the Eastern owners and have stopped work.

Hamilton, 45 miles west of Ely, is shipping lead-silver ores by way of Eureka. Lessees from the Robinson district are shipping a car of high-grade lead ore from a new lead mine on top of Snake range, north of Sacramento pass. They have a large orebody, of a 20% concentrating ore. The Red Hills mine is mining and preparing to ship another car of lead-silver ore.

Three cars of ore are being shipped from the Lucky Deposit mine at Aurum. The copper sulphide ore assays 7 to 8% copper and \$6 in gold and silver per ton. It is hauled by auto truck 56 miles.

Ely, September 18.

#### UTAH

##### JUAB COUNTY

The Tintic Drain Tunnel Co., Provo City, has been incorporated and proposes the construction of a 5½-mile adit from Goshen valley to a point near Silver City. Mine drainage and the development of water for irrigation are the objectives sought by the company.

##### SALT LAKE COUNTY

Bingham Mines Co. has declared a dividend of 50c. per share, amounting to \$71,500.

The Utah Apex Mining Co. has declared a dividend of 25c. per share. The aggregate sum is \$264,000 and the total dividends to date amount to \$851,125.

##### SUMMIT COUNTY

A dividend of 25c. per share has been declared by the Judge M. & S. Co. The total dividends paid amount to \$1,900,000.

The Daly West has declared a dividend of 10c. per share on 150,000 shares.

The Silver King Coalition will pay a dividend of 15c. per share on 1,250,000 shares.

Preparations are being made to work on the Utah-Park through the Ontario drainage-adit.

The August production of Park City totalled 10,217 tons.

#### WASHINGTON

Official announcement was made by Bart L. Thane that a steel plant together with subsidiary enterprises would be con-

structed on Puget Sound. At present the preliminary engineering work is being done but actual construction will depend on more favorable economic conditions.

The Electric Point declared a dividend of three cents per share, payable September 30. The mine is earning at a greater rate and has a surplus. This is the fourth dividend and the total disbursements are \$71,370.

## CANADA

### BRITISH COLUMBIA

(Special Correspondence.)—The Canada Copper Corporation has increased its force at the Copper Mountain mine to 250 men. Bunk-houses, dwellings, water and sewer systems are being constructed. Funds to the amount of \$2,500,000 have been raised by the sale of bonds which were underwritten by Hayden, Stone & Co. of New York.

Charles Camsell, of the Dominion Geological Survey, is at Copper Mountain engaged in geological investigation.

A 50-ton concentrator will be built on the Bowena mine, Bowen island. The King Solomon mine near Greenwood is shipping 15% copper ore. Deposits of good-grade ore have been discovered on the 750-ft. level of the Erin, near Kamloops. A mill and compressor-plant will be installed at the Victor mine near Fort Steele. The vein on the 8th level of the Slocan Star has widened to six feet.

The mill of the Surf Inlet gold mine is in satisfactory operation. Enlargement of its present capacity of 250 tons per day is looked for. A 96% recovery is being made and concentrate assaying \$100 per ton is produced. The concentrate is shipped to the Tacoma smelter.

Vancouver, September 14.

The Fisher Maiden mine,  $1\frac{1}{2}$  miles from the Slocan Star, in the Slocan district, has been bought by Barney Crilly, an operator of British Columbia, on a bond and lease for three years, at a reported price of \$100,000. Jules L. Prickett is president of the corporation, known as the Fisher Maiden-Troy Mines, Limited.

The Hedley Gold Mining Co. has declared its regular quarterly dividend of 3% and an extra dividend of 2%. This is at the rate of 50c. per share on 120,000 shares issued.

The Ladysmith smelter will be enlarged at once at a cost of \$2,000,000. The plant now handles 400 tons of copper ore per day and the extensions will increase the capacity to 1200 tons.

The Con. M. & S. Co. received at its plant at Trail, during the first seven days of September, 10,864 tons of ore from 31 mines.

## KOREA

The Seoul Mining Co., operating the Suan Concession in Whang Hai province, Chosen, reports a recovery of \$139,305 from their operations during the month of August.

## MEXICO

The subject of making spelter in Mexico has been frequently studied by many companies and individuals in the past, and all have decided that owing to the high cost of fuel, such an industry would not be payable. It is interesting to note, therefore, that an experimental plant has been erected and that a working plant is in course of erection. The International Ore Co., at Saltillo, in Coahuila, whose manager is F. E. Salas, is constructing two furnaces of 300 retorts each, having a capacity estimated at 40 to 45 tons per day, and a production of 15 tons of spelter per day. The furnaces will be fired with crude oil, and the gases from them will be used under the boilers of the power-plant. The total cost of the above plant is estimated to be \$90,000. That spelter will be produced by the above plant there is no doubt, but whether the business will be profitable or not with the present prices, remains to be seen.

# PERSONAL

*Note: The Editor invites members of the profession to send particulars of their work and appointments. This information is interesting to our readers.*

F. G. COTTRELL is here.

J. F. THORN has returned to San Francisco.

R. A. F. PENROSE has returned to Philadelphia.

J. H. MEANS is in the Manigotagon district of Manitoba.

F. L. SIZER is examining mines near Deming, New Mexico.

RUSH M. HESS has gone from Arizona on a visit to New York.

ASKIN M. NICHOLAS has arrived at New York from Australia.

D'ARCY WEATHERBE is in Japan, on his return from Siberia.

EDWARD L. DUFOURCQ is manager for the Teziutlan Copper Co. in Mexico.

J. R. FINLAY has returned to New York from the Lake Superior region.

NORMAN L. CALDER is with the Royal Engineers at Sandwich, in England.

W. A. PRICHARD, manager of the Pato and Nechi mines, in Colombia, is here.

H. W. BAKER, of Boston, is examining mines in the Kirkland Lake district of Ontario.

J. E. THOMPSON has returned to New York after a visit to the Californian oilfields.

RUSSELL WOAKES, son of ERNEST R. WOAKES, has won the Military Cross in Mesopotamia.

HEATH STEELE has been appointed chief engineer to the American Metal Co., at New York.

FRANK L. HESS, of the U. S. Geological Survey, was in San Francisco on his way to Arizona.

H. B. PULSIFER has become Professor of Metallurgy in the Montana School of Mines at Butte.

ERLE P. DUDLEY has received a commission as Captain in the Engineer Officers Reserve Corps.

ARTHUR B. FOOTE, superintendent of the North Star Mines, was in San Francisco during the week.

W. H. WHITTIER is Lieutenant with the Engineer Officers' Reserve Corps at Fort Leavenworth, Kansas.

A. E. RAU-ROESLER has returned from Arizona and is operating the White Oak mine in Mariposa county.

C. D. KAEDING, manager for the Dome Mines company, at Porcupine, has returned to New York from San Francisco.

J. C. HOUSTON had to resign as superintendent for the Dome Mines owing to ill health and is now examining mines in British Columbia.

E. COPPÉE THURSTON has resigned his appointment with the Bunker Hill smelter to enlist in the service of the American Red Cross in France.

ARTHUR L. WALKER, Professor of Metallurgy in Columbia University, has been retained as consulting metallurgist by the War Department.

HENRY M. PARKS has resigned as Dean of the School of Mines at Corvallis, Oregon, to become Director of the Oregon Bureau of Mines and Geology.

CLARENCE WOODS has resigned as superintendent for the Louisiana Con. M. Co., at Tybo, Nevada, to accept a position with the A. S. & R. Co., at Blue Hill, Maine.

F. E. DOWNS, formerly mill-superintendent for the Rex Con. M. Co., at Wallace, Idaho, is now at Monterrey, Mexico, where he holds the same position with the Compañía de Minerales y Metales, S. A.

## Production of Ontario Mines

Returns received by the Ontario Bureau of Mines from the smelters, refineries, and mines of the Province for the six months ended June 30, 1917, are summarized herewith.

per annum. The Port Colborne refinery of the International Nickel Co. will produce 7500 tons of nickel, and provision is made for quadrupling the capacity.

**COPPER.** Shipments for the half-year came from three sources, the Tip Top mine near Kashabowie, the Hudson Copper Co. at Havilah, and the Kenyon Copper Co. at Massey. The last-

Product	Quantity		Value	
	1916	1917	1916	1917
Gold, oz.....	235,060	228,673	\$4,822,740	\$4,586,941
Silver, oz.....	10,267,743	10,073,787	6,188,269	7,584,439
Cobalt (metallic), lb.....	121,817	162,250	103,677	237,004
Nickel (metallic), lb.....	13,933	45,864	5,899	19,073
Nickel oxide, lb.....		5,495		1,648
Cobalt oxide, lb.....	410,408	153,498	204,638	175,308
Other cobalt and nickel compounds, lb.....		122,076		15,879
Molybdenite, lb.....	12,631	36,777	13,075	47,942
Lead, lb.....		912,934		114,955
Copper ore, tons.....	922	1,543	14,368	45,688
Nickel in matte, tons.....	20,651	20,230	10,325,766	10,115,000
Copper in matte, tons.....	11,426	10,381	4,207,620	4,152,400
Iron ore (exported), tons.....		24,332		85,135
Pig-iron, tons.....		40,968		715,912
			\$25,886,052	\$27,897,322

It will be noted that the figures are for pig-iron produced from Ontario ore only. Nickel and copper in matte have been valued at 25 and 20c. per pound, respectively, and copper was valued at 18½c. per pound in 1916.

**GOLD.** It was anticipated that the production for the half-year would show a decline as compared with the same period in 1916, owing to labor troubles and shortage in the Porcupine district. Nearly all the mines, including the Hollinger and Dome, have been developing their orebodies and increasing their milling capacity in preparation for the time after the War when labor will be more plentiful and operating costs decreased. In the meantime production and dividends have been curtailed. New producers are Gold Reef and Tommy Burns at Porcupine, Teck-Hughes at Kirkland Lake, and Miller-Independence at Boston Creek. Mines, producing 5000 oz. or more gold, in order of importance, were Hollinger, McIntyre, Dome, Porcupine Crown, Tough-Oakes, Schumacher, and Porcupine V. N. T.

High prices for silver, which averaged 75.44c. for the half-year as compared with 62.53c. for the same period of 1916, have stimulated production from Cobalt. The advance in value has offset the increased cost of mining. If the Miller-Lake O'Brien continues shipping at the same rate throughout the year, Gowganda will show a record production for 1917. The increase is attributed to the high-grade vein discovered in the summer of 1916. The Hargrave mine is now shipping regularly. The National, formerly the King Edward mine, is a new shipper. The Mining Corporation of Canada (Cobalt Lake and Townsite City mines) shipped over 2,000,000 oz. in the half-year. Shippers of 500,000 oz. or more were Nipissing, Kerr Lake, O'Brien, Beaver, and Coniagas. Silver recovered from gold ores totalled 38,492 oz. and from copper ores 646 ounces.

**NICKEL-COPPER.** The production of nickel-copper matte at Copper Cliff and Coniston shows a small decrease as compared with the same period in 1916, owing to shortage of labor. Assays of samples of nickel-copper matte for their precious-metal contents were made for the Royal Ontario Nickel Commission by Ledoux & Co. of New York. Platinum and palladium were found in quantities varying from 0.32 to 1.97 oz. per ton of matte. These metals are quoted at \$100 per ounce. The British American Nickel Corporation has announced that its new electrolytic refinery will be built at the Murray mine, and will have an initial capacity of 5000 tons of nickel

mentioned operates the Massey mine, where a 100-ton Callow flotation-mill is producing 20% concentrate. Shipments from the Bruce mines are included under nickel-copper. The Port Arthur Copper Co. at Mine Centre is erecting a concentrator and will be shipping soon.

## The A. I. M. E. Meeting at St. Louis

How to increase the supply of manganese ore for the American steel industry in the war emergency is one of the principal subjects to be discussed at the 115th meeting of the American Institute of Mining Engineers during the week of October 8 to 13. Prominent engineers from many parts of the country will attend the sessions which are to be held in mining districts of Illinois, Missouri, Kansas, and Oklahoma.

It is impossible for the United States to supply the steel industry with enough manganese if the present practice of using manganese is maintained. This is the word that D. F. Hewett of the U. S. Geological Survey has given the Institute. As a result, the Institute officials have informally issued a call for some 6000 members to present suggestions for methods of using these ores. This is only one of the subjects in connection with the development of the country's mineral resources for greater war service that is to be presented at the mining engineer's meeting. An effort will be made along several lines to co-operate with the Government and the mining interests with the expectation of increasing production, conserving the present supply, and improving the methods of using the country's minerals.

There were only two shippers of manganese ore in the United States in 1913 and last year this number had grown to 53. This year the rate of production is about three times that of last year and certain States have increased their output to five times that of 1916. Even with this increase it is stated that the war demand already calls for a greater increase in production. Manganese is chiefly found in Montana, Virginia, Arkansas, and California.

The mining engineers will open their convention at St. Louis on October 8 with a patriotic meeting and will journey to neighboring points in Illinois, Kansas, and Oklahoma by special train. Technical sessions will be held relating to the work of the individual districts at every important centre that is visited. An elaborate social programme has been arranged by the engineers of the St. Louis district.

## Potash in 1916

A comprehensive review of the potash industry of the U. S. is given by Hoyt S. Gale of the U. S. Geological Survey. The domestic production of potash for 1916 totaled 9720 tons of a value of \$4,242,730 at the point of shipment. The significance of this production is commented upon by Gale, who states that much of the present production of potash is maintained by the war prices and cannot be continued after these prices fall. Some of the projects may be permanent, but unfortunately their output is yet small. The only exception, perhaps, is Searles Lake, which now bids fair to produce enough potash to take the edge off the market by supplying the most urgent requirements for home consumption, such as those of the chemical industries, but the operation of the Searles Lake deposits is hardly yet under way. So far as is now evident, there is probably no domestic source adequate to supply more than a small percentage of the domestic consumption, but the slight promise should not by any means exclude all hope of larger success.

The activity of private initiative in the development of possible sources of potash is increasing. Interest in the possible recovery of potash as a by-product is very keen, and some of these sources, such as the dust of cement and blast-furnaces, seem to offer much promise of development on an extensive scale, but are not yet far enough advanced to warrant confident prediction that they will ultimately supply the country's whole needs. Perhaps the real hope of making the country independent of foreign supplies lies in the possibility of discovering, in association with some of the very extensive and little-known domestic deposits of salt, a supply of potash that may compete with the foreign supply on equal terms. There are valuable deposits of potash in the Permian in central Germany, in the Oligocene (Tertiary) in Alsace, the lower Miocene (Tertiary) in Galicia, and in the supposed Eocene or Oligocene (Tertiary) in north-eastern Spain, all accompanied by deposits of common salt, dolomite, and gypsum, and it would be strange if deposits of this sort were confined entirely to Europe.

Governmental agencies have served and are still serving a useful purpose in aiding development.

The imports of potash salts into the United States are given in considerable detail and from Gale's tables the quantities given in the succeeding summary have been taken.

IMPORTS OF POTASH SALTS

	1912		1916	
	Quantity (tons)	Value	Quantity (tons)	Value
Chloride .....	241,665	\$7,229,121	1,299	\$348,961
Sulphate .....	49,119	1,783,846	1,693	81,684
Carbonate, crude.	3,813	234,868	341	113,413
Nitrate .....	3,256	202,899	5,769	1,519,375
Caustic .....	4,845	370,506	242	16,694
Cyanide .....	363	109,434	1	803
Other salts .....	8,429	761,611	1,243	271,518
Kainite .....	573,413	2,386,362	40	1,173
Manure salts....	192,368	1,797,057	1,249	21,273

The prices per metric ton of German potash salts delivered at Eastern ports before the beginning of the War were:

	1912-13	1914
Muriate of potash (80% KCl; 50% K <sub>2</sub> O)....	\$38.05	\$39.07
Sulphate of potash (90% K <sub>2</sub> SO <sub>4</sub> ; 48% K <sub>2</sub> O)...	46.30	47.57
Manure salts (20% K <sub>2</sub> O).....	13.30	13.58
Kainite (12.4% K <sub>2</sub> O).....	8.25	8.36

Since the beginning of 1915 the prices of these salts have risen enormously. During 1916 potash-bearing fertilizer, on the basis of water-soluble potash, has commanded a price ranging from \$3 to \$3.50, and even reaching \$5 to \$6 per unit.

## Recent Publications

NOTES ON THE GEOLOGY AND IRON ORES OF THE CUYUNA DISTRICT, MINNESOTA. By E. C. Harder and A. W. Johnston. Bulletin 660-A, U. S. Geological Survey. The bulletin is a review of the more important features relating to the occurrence of iron ores in the Cuyuna district.

TUNGSTEN MINERALS AND DEPOSITS. By Frank L. Hess. Bulletin 652, U. S. Geological Survey. The bulletin makes known the general facts about tungsten, the minerals in which it is found, and the nature of the deposits. Methods for the approximate determination of tungsten are given. Excellent illustrations are a conspicuous feature.

THE DE SOTO-RED RIVER OIL AND GAS FIELD, LOUISIANA. By G. C. Matson and O. B. Hopkins. Bull. 661-C, U. S. Geological Survey.

ENRICHMENT OF ORE DEPOSITS. By William Harvey Emmons. Bull. 625, U. S. Geological Survey. The paper is an amplification of an earlier Survey bulletin on the enrichment of sulphide ores (Bull. 529). It is a discussion of representative deposits, especially of the paragenesis of their ores and of the principles that underlie the process of enrichment. To Western metal-miners the material of this bulletin should be of special value.

STRUCTURE OF THE NORTHERN PART OF THE BRISTOW QUADRANGLE, CREEK COUNTY, OKLAHOMA—PETROLEUM AND NATURAL GAS. By A. E. Fath. Bull. 661-B, U. S. Geological Survey.

CHEMICAL RELATIONS OF THE OIL-FIELD WATERS IN SAN JOAQUIN VALLEY, CALIFORNIA. By G. Sherburne Rogers. Bull. 653, U. S. Geological Survey.

ECONOMIC GEOLOGY OF GILPIN COUNTY AND ADJACENT PARTS OF CLEAR CREEK AND BOULDER COUNTIES, COLORADO. By Edson S. Bastin and James M. Hill. Prof. Paper 94, U. S. Geological Survey.

GEOLOGY AND ORE DEPOSITS OF THE MACKAY REGION, IDAHO. By Joseph B. Umpleby. Prof. Paper 97, U. S. Geological Survey.

REPORT ON MINING OPERATIONS IN THE PROVINCE OF QUEBEC DURING THE YEAR 1916. By the Mines Branch of the Dept. of Colonization, Mines and Fisheries.

THE RUSTLER SPRINGS SULPHUR DEPOSITS. By E. L. Porch, Jr. Bull. 1722, University of Texas.

REPORT OF THE FEDERAL TRADE COMMISSION ON ANTHRACITE AND BITUMINOUS COAL. Government Document, Washington, D. C.

THE USE OF THE PANORAMIC CAMERA IN TOPOGRAPHIC SURVEYING. By James W. Bagley. Bull. 657, U. S. Geological Survey. The methods described have been used in Alaska. Camera and plane-table offer advantages in cost and speed of execution of topographic surveys. The methods outlined should be of interest to mining engineers.

MANGANESE DEPOSITS OF THE CADDO GAP AND DE QUEEN QUADRANGLES, ARKANSAS. By Hugh D. Miser. Bulletin 660-C., U. S. Geological Survey.

POTASH IN 1916. By Hoyt S. Gale. Mineral Resources of the United States, U. S. Geological Survey.

COKING OF ILLINOIS COALS. By F. K. Ovtz. Bulletin 138, U. S. Bureau of Mines.

ABSTRACTS OF CURRENT DECISIONS ON MINES AND MINING. By J. W. Thompson. Bulletin 152, U. S. Bureau of Mines.

EXTRACTION OF GASOLINE FROM NATURAL GAS BY ABSORPTION METHODS. By George A. Burrell, P. M. Biddison, and G. G. Oberfell. Bull. 120, U. S. Bureau of Mines.

# THE METAL MARKET

## METAL PRICES

San Francisco, September 25

Aluminum-dust (100-lb. lots), per lb.	\$1.00
Aluminum-dust (ton lots), per lb.	\$0.95
Antimony, cents per pound.	16.50
Antimony (wholesale), cents per lb.	14.75
Electrolytic copper, cents per pound.	28.00
Pig lead, cents per pound.	8.50—9.50
Platinum, soft and hard metal, respectively, per ounce.	\$105—\$111
Quicksilver, per flask of 75 lb.	\$105
Spelter, cents per pound.	10
Tin, cents per pound.	61
Zinc-dust, cents per pound.	20

## ORE PRICES

San Francisco, September 25

Antimony, 45% metal, per unit.	\$1.10
Chrome, 40% and over, free SiO <sub>2</sub> limit 8%, f.o.b. California per unit, according to grade.	\$0.60—0.75
40-45% .....	\$0.75
45-50% .....	\$0.80
50% and over .....	\$0.90
55% and over .....	\$1.00

Chrome prices show a tendency to remain stationary. With the advent of winter, when the haulage conditions are less favorable than at present, prices will be more erratic and are likely to go higher.

Magnetite, crude, per ton.	\$8.00—10.00
Manganese: The Eastern manganese market continues fairly strong with \$1 quoted on the basis of 48% material.	
Tungsten, 60% WO <sub>3</sub> , per unit.	28.00
Molybdenite, per unit for MoS <sub>2</sub> contained.	\$40.00—45.00

## EASTERN METAL MARKET

(By wire from New York)

September 25.—Copper is inactive and nominal, remaining at 26.25c. until Friday; then Government price at 23.50c. The remainder of the week. Lead is steady and unchanged, remaining at 8c. all week. Zinc is quiet and firm at 8.37 to 8.50c. Platinum remains unchanged at \$105 for soft metal and \$111 for hard.

## SILVER

Below are given the average New York quotations, in cents per ounce, of fine silver.

Date	1915	1916	1917	Avg. week ending
Sept. 19	105.50			82.95
" 20	106.50			87.16
" 21	108.50			88.50
" 22	108.50			91.12

June	19.75	27.47	32.57	Dec.	20.67	32.89	...

The Chile Copper Co., operating the Chuquicamata mines, reports a production of 22,573,314 lb. copper in the second quarter of this year and a net income during this period of \$3,036,143. The tonnage treated was 741,371 and the average grade 1.68%. The net recovery of copper was 82.9%. The cost at the plant was 8.53c. per pound, but the total cost of copper delivered at New York was 12.22c. per pound.

## ZINC

Zinc is quoted as spelter, standard Western brands, New York delivery, in cents per pound.

Date	1915	1916	1917	Avg. week ending
Sept. 19	8.37			8.75

## ORES

Tungsten: Considerable business is reported at prices ranging at the usual quotations and the market is strong. Ferro-tungsten is quiet at unchanged prices. Exports of the alloy and the metal for the fiscal year ended June 30, 1917, were 1,784,306 lb., a record never exceeded before by this country or probably any other.

Molybdenum and antimony: It is reported that small transactions have been put through at \$2.20 per lb. of MoS<sub>2</sub> for 90% material. Low-grade ore, containing 50% MoS<sub>2</sub> has gone at \$1.35. Antimony ore is unchanged and dull.

## CYANIDE

Sodium cyanide, 96-98% (51-52% cyanogen) is quoted at 37c. per pound at New York.

## PRICES OF IRON AND STEEL

On September 24 the War Industries Board made known the new schedule as arranged with the producers. These prices will hold good until January 1, 1918, when they will be revised. The new prices follow:

Steel bars at Pittsburgh and Chicago, \$2.90 per hundredweight, Coke (Connellsville), price agreed upon, \$6 net ton, a reduction of 62.5%.

Steel plates, basis Chicago and Pittsburgh, price agreed upon, \$3.25 per hundredweight, a reduction of 70.5%.

Pig-iron, price agreed, \$33 gross ton; recent price, \$58 gross ton; a reduction of 43.1%.

Steel bars, Pittsburgh and Chicago basis, price agreed upon, \$2.90 per hundredweight; recent price, \$5.50 per hundredweight; a reduction of 47.3%.

Steel shapes, basis Chicago and Pittsburgh, price agreed upon, \$3 per hundredweight, a reduction of 50%.

# Eastern Metal Market

New York, September 19.

The better feeling, noted last week, has given place to one of disappointment, principally due to indecision in the copper price-fixing matter which was fully expected last week. All the metals are dull and transactions are few and small in number.

Copper is dead and nominal.

Tin is fairly firm and in occasional demand.

Lead is lifeless and much lower.

Zinc is steady and firmer.

Antimony is quiet but higher.

Aluminum has declined.

The steel market is marking time waiting for price fixing and in the meanwhile prices decline. Re-sale pig-iron is weakening this market and generally the market is \$2 below last week's level. The fuel situation is causing considerable anxiety in the steel industry and has become serious since the fixing of the \$2 base price for soft coal. Some Eastern makers of plates and shapes are facing a shut-down because of a shortage of gas-coal and the Government may have to supply coal to some iron and steel producers from whom it has bought material. There is dissatisfaction with present war buying methods and manufacturers who recently ceased to act on advisory committees because of legal questions are not likely to resume the relation.

## COPPER

After a brief experience of a better feeling and what promised to be a more active market last week, due to the large purchase for the Allies at 25c. per lb., the copper market has again become stagnant and lifeless. The fact that the decision, which was fully expected last week, as to the price for Government copper, has been delayed as it has, has caused keen disappointment and brought out strongly a realization that the conflict of opinion at Washington is hard to smooth out. Various rumors continue to fill the market, the latest today being that 24c. will probably be the level for Government purchases. Any level would be better than no decision which thus far has demoralized trade and interfered with manufacturing and business in general. Quotations based on actual sales for any position are hard to find, buyers being disinclined to commit themselves. For early delivery we continue to quote electrolytic copper nominally at 26.25c. per lb., New York. The average quotation for last quarter is nominally 26.50 to 27c., New York. The London market is unchanged at £137 for spot electrolytic and £133 for futures.

## TIN

The tin market has passed through an advance since last week but yesterday was at a lower level than the high point of the week. As high as 62.50c. was paid last Friday, September 14, but yesterday the market was 61.75c., New York. Since our last letter there has been but one day on which any transactions of volume were recorded. This was on Wednesday, September 12, when quite a business was done very quietly, made up largely of tin afloat to the United States, of prompt shipment from London, and of metal coming overland to New York from Vancouver. These sales resulted in a better tone. For the rest of the week, however, the market was dull and inactive. Some excitement was caused by an inquiry from a big steel company for 25 tons of spot tin and for 25 tons for delivery each month for the rest of the year. Spot Banca tin sold on Thursday, September 13, at 60c. in store, New York, but spot Straits was scarce with occasional 5-ton lots changing hands. Due to the sudden and unexpected reduc-

tion in the price of lead on Thursday, further buying of tin was checked and the market eased off. Yesterday and Monday, this week, the situation has been stale and lifeless with no sales reported. An easier tone has developed, due to freer arrivals and to sellers being more anxious to sell. Arrivals up to and including yesterday were 1635 tons as compared with only 700 tons a week ago. The quantity afloat yesterday was 4600 tons. The London market has advanced £3½ in the week to £246 10s. for spot Straits.

## LEAD

No such record has ever been made in lead price reductions than has taken place in the last week. On top of the two reductions of ½c. each by the leading interest, previous to last week, the same producer has made two cuts of 1c. per lb. each in the past week. The first of these was on Thursday, September 13, when its price was put at 9c. per lb., New York. At that time it was regarded as the greatest alteration in price ever made by the big company. On top of this, late yesterday came another reduction of 1c. per lb. to 8c. This is the level at which sales to the Government have been made in recent months for its monthly needs. Outside producers have met the cut in each case so that yesterday the general quotation was 8c., New York, or 7.87½c., St. Louis. When the first cut of 1c. was made a plausible reason advanced in the trade was the fact that refiners had received ores, concentrates, and bullion faster than sales of metal. Under such conditions there has been a decided abstinence from the market, some sellers have been anxious to sell when the market was around 9.50 to 9.80c., New York. The fixing of 8c. is regarded as a really bright spot for it is believed this will be the bottom since it is the Government price.

## ZINC

A distinctly better feeling pervades the market and the entire situation is stronger than for some time. The improved sentiment, noted last week, has not lost any force and the belief is firmer among many dealers that the bottom was reached the past month or two and that, unless some unforeseen event changes present conditions, an extensive buying movement is in the making which will be in force before many weeks. It is pointed out that prices are low, actually below cost, that consumption has gone on, perhaps at a diminished rate, but in large volume, and that production has been curtailed 30 to 40%. A continuation of the war for one year at least, as now seems probable, will result in increased needs from the Allies and from our own Government. While inquiry is better, it is modest but is improved over that for August. The market is stronger and quotably higher with September delivery at 8.12c., St. Louis, or 8.37c., New York, and October at 8.25c., St. Louis, or 8.50c., New York. Better than this is reported to have been done. Exports of zinc for the fiscal year ended June 30, 1917, were 66,108,586 lb., exclusive of ore and dross. This compares with 45,867,156 lb. for the fiscal year of 1916 and with 21,243,935 lb. for the same period in 1915. Bids have been asked by the Government on 1000 tons of grade B zinc for extended deliveries, bids to be opened September 24. The lowest quotation on this has been 11.50c. per lb., some demanding as high as 12c.

## ANTIMONY

The market fell to 14c. or under since our last letter at which levels fairly large sales are reported to have been made. An advance has taken place since and 15 to 15.50c. per lb. is now quoted for Chinese and Japanese grades, duty paid, New York, with the market dull and lifeless.

# EFFECT OF ANTI-FRICTION BEARINGS IN MINE-HAULAGE

By P. B. LIEBERMANN

\*For mine-haulage, locomotives are required, the size and power-consumption of which depend on the resistance offered by the mine-cars. This is principally caused by gravity and bearing-friction. The effect of gravity can be reduced to a minimum by a suitable lay-out of the haulage-ways, that is, by

train, and records the following quantities: draw-bar pull in pounds, speed in miles per hour, and a time interval, usually 5 sec.; the paper travel is proportional to the distance covered by the car. Opposite these records the profile of the road is drawn in by hand so that full particulars of train-resistance for any grade or length of track can be read from the chart at a glance. As an illustration, two charts are shown in Fig. 1 and 2 obtained at a comparative test at the D. & H. Co.'s Coalbrook colliery at Carbondale, Pennsylvania. The following types of mine cars were used:

Item	Bearing	Position of bearing	Diam. of journal, in.	Length of bearing, in.	Track gauge, in.	Diam. of Wheel, in.	Wheel base, in.	Draw-bar to top of rail, in.
1	Roller	Outside box.....	2 $\frac{1}{2}$	4	30	16	36	14
2	Plain	Outside box.....	2 $\frac{1}{2}$	4	30	16	36	14

arranging the grades in favor of the loaded trips, and by fixing the grade to that percentage which gives the lowest power-consumption for loaded and empty trains. The bearing-friction, which is considerably greater than is generally realized, can be reduced to a negligible quantity by the installation of a suitable anti-friction bearing that will stand the rough use and abuse of mine-service.

Tests for determining train-resistance have been run during

These cars were identical in every respect except the bearings. All wheels were loose and were laid on the axle between a shrunk-on collar on one side and the bearing-box on the other, and all had side bumpers. The cars had seen enough service to insure well run-in bearings. For lubrication a high-grade liquid grease was used. The plain bearings were self-lubricating by a felt pad in an oil reservoir; the roller-bearings were self-lubricating due to their inherent hollow helical con-

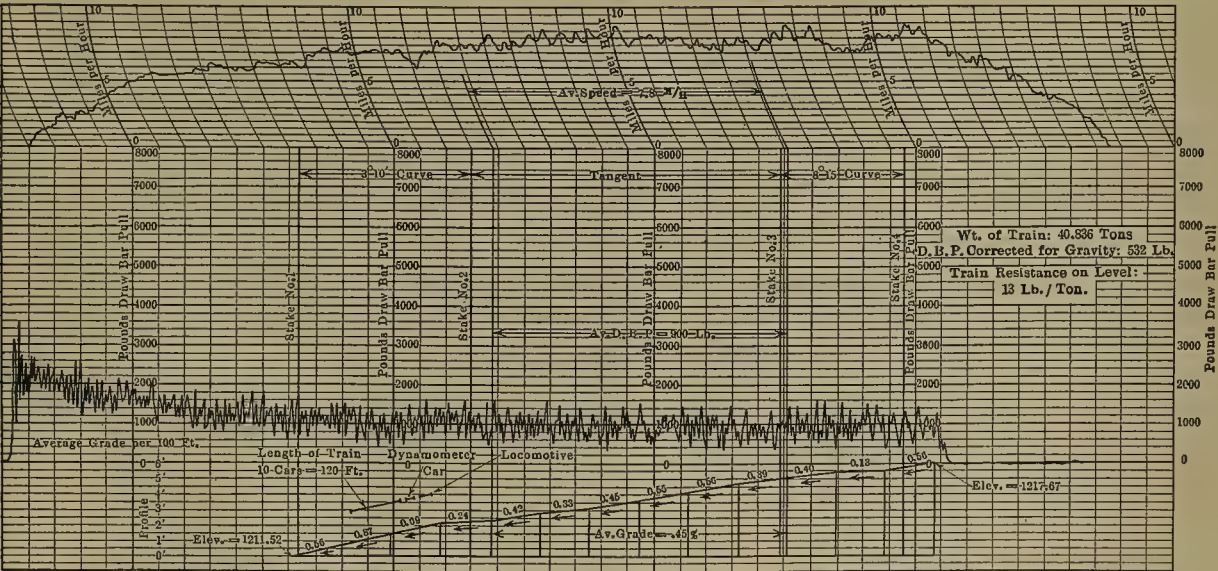

FIG. 1. TEST ON 10 LOADED FLEXIBLE ROLLER-BEARING MINE-CARS

the last two years in the bituminous and anthracite coal regions. For these tests a dynamometer-car was used. This car is equipped with recording instruments and is automatic in its operation. It is coupled between the locomotive and the

struction. No bearings received overhauling or special treatment for any of the tests. Each of the tests was run first with a train of cars having one type of bearing and was immediately followed by another with a train of the same number of cars, but with the other type of bearing and on the same piece of track under identical conditions.

An average value of these data can be expressed in an

\*Chief Engineer, Hyatt Roller Bearing Co.: Abstract, Trans. A. I. M. E., St. Louis meeting.

equation. Any formula for train-resistance consists of three terms, as follows:

$$R = A + BS + CS^2$$

where

$R$  = train-resistance in pounds per ton on straight level track.  
 $A$  = friction-constant relating to bearing and rolling-friction.

$B$  = friction-constant relating to speed.

$C$  = friction-constant relating to air-resistance.

$S$  = speed in miles per hour.

determined  
by  
experiment

Owing to the low speeds in mine service, the air-friction is insignificant, and the last term of the formula,  $CS^2$ , can be dropped. The test-data met the following equations:

$Rp = 26 + 0.45S$  = train-resistance of loaded plain-bearing cars in pounds per ton.

$Rr = 9 + 0.45S$  = train-resistance of loaded flexible roller-bearing cars in pounds per ton.

These formulae apply to average mine conditions, with clean tracks, with cars of from 2 to 4-ton capacity, and with wheels not below 16 in. diameter.

Tracks covered with dust caused an increase in train-resistance of about 30%. This is the figure obtained with the dynamometer car behind the locomotive. The locomotive, by rolling down the dust and loose particles, lessens their effect on the train. Tests with empty cars showed that the train-resistance per ton is about 40% higher with plain-bearings and about 15% higher for the roller-bearings than would be obtained from the formula for loaded cars.

Fig. 3 shows graphically the relation between the train resistance and the speed of loaded and empty cars. The friction-factor is the percentage of the train-weight required to keep the train in motion at any given speed. If  $WL$  = the weight of a train of loaded cars in tons and  $WE$  = the weight of a train of empty cars in tons, the total train-resistance in pounds on straight level track will be:

$$FL = WL \times RL \text{ and } FE = WE \times RE$$

When running on a grade the effect of gravity is as follows:

$$FL = (WL \times RL) \pm (WL \times G \times 20) \text{ and } FE = (WE \times RE) \pm (WE \times G \times 20)$$

$G$  is the grade in per cent, while 20 is the added draw-bar pull in pounds per ton per 1% of grade. The grade also affects the tractive effort of the locomotive by the grade percentage of its own weight. If  $M$  = the weight of the locomotive in tons, then, for a loaded train of cars:

$$FL \pm (M \times G \times 20) = (WL \times RL) \pm (WL \times G \times 20)$$

and for a train of empty cars,

$$FE \pm (M \times G \times 20) = (WE \times RE) \pm (WE \times G \times 20)$$

The symbols have the following meanings:

$FL$  = total train-resistance of loaded cars in pounds.

$FE$  = total train-resistance of empty cars in pounds.

$WL$  = weight of a train of loaded cars in tons.

$WE$  = weight of a train of empty cars in tons.

$RL$  = train-resistance of loaded cars in pounds per ton.

$RE$  = train-resistance of empty cars in pounds per ton.

$M$  = weight of locomotive in tons.

$G$  = grade in per cent.

20 = gravity-force in pounds per ton per 1% of grade.

The foregoing will apply to any individual mine by making the necessary change of those items which differ from the example. For instance, take the following as a description of the 1000-ton per day mine:

Output per day .....	1,000 tons
Capacity of each mine car.....	3 tons
Number of carloads to supply 1000 tons.	333 $\frac{1}{3}$
Weight of an empty car.....	2,500 lb.
Weight of a loaded car.....	8,500 lb.
Average distance per car per trip loaded.	5 miles

Average distance per car per trip empty.	5 miles
Average speed of trains.....	6 miles per hr.
Working-hours per day.....	8
Time for a round trip, hours.....	2
Round trips per day per train.....	4

To find the theoretical grade that will result in equalized locomotive effort in pulling a loaded train down grade and bringing the same train of empty cars up the grade, that is,  $FL = FE = F$ , the last two equations can be written as follows:

$$\frac{F - (M \times G \times 20)}{(WE \times RE) + (WE \times G \times 20)} = \frac{F + (M \times G \times 20)}{(WL \times RL) - (WL \times G \times 20)}$$

It then follows:

$$G = \frac{(WL \times RL) - (WE \times RE)}{20(WE + WL + 2M)}$$

In these equations

$F$  = draw-bar pull of locomotive on level in pounds.

$M$  = weight of locomotive in tons.

$G$  = percentage of the desired grade.

$WE$  = weight of a train of empty cars in tons.

$WL$  = weight of a train of loaded cars in tons.

$RE$  = train-resistance of empty cars in pounds per ton.

$RL$  = train-resistance of loaded cars in pounds per ton.

20 = gravity-force in pounds per ton per 1% of grade.

Substituting for the train-resistance the figures found by test for the speed of 6 miles per hour, the data shown in the following table are obtained:

TABLE I

	Plain-bearing cars	Roller-bearing cars
Train-resistance of loaded cars, pounds per ton .....	28.6	11.6
Train-resistance of empty cars, pounds per ton .....	40.0	13.6
Grade for equalized draw-bar pull, per cent .....	0.61	0.284
Number of cars per trip.....	42	42
Tons hauled per train.....	126	126
Train-resistance, loaded cars out, pounds	2,930	1,069
Train-resistance, empty cars in, pounds.	2,740	1,027
Train-resistance, starting (estimate), pounds .....	4,000	1,200
Necessary weight of locomotive, tons..	8	3
Number of locomotives .....	2	2
Foot-pounds per train per round trip....	146,800,000	54,100,000
Kilowatt-hours per train per round trip	55.3	20.4
Kilowatt-hours all trips per day.....	443	163
Foot-pounds per locomotive per round trip .....	8,430,000	3,160,000
Kilowatt-hours per locomotive per round trip .....	3.180	1.195
Kilowatt-hours of two locomotives per day .....	25.40	9.55
Total kilowatt-hours per day of cars and locomotive .....	468.40	172.55
Total cost of power per day at 2c. per kilowatt-hour at locomotive* .....	\$9.36	\$3.45
Total cost of power per year of 300 days	\$2,810.00	\$1,035.00
Lubrication material and labor per car per year as found in actual service..	\$1.73	\$0.29
Lubrication 164 cars per year.....	\$284.00	\$47.50
Total cost of power and lubrication per year .....	\$3,094.00	\$1,082.50
Saving .....		\$2,011.50

\*The power cost of 2c. per kw-hr. at the locomotive corre-

sponds to a charge of approximately 1c. per kw-hr. at the switchboard. This is due to the losses taking place in transformers, converters, transmission line, locomotive motor, rails, rail bonding, and elsewhere.

A saving of \$2011.50 per year has been accomplished through the application of flexible roller-bearings. These roller-bearing cars are necessarily more expensive than the ordinary

### 'PABCOAT'

The Paraffine Paint Co., 34 First street, San Francisco, is marketing a novel fire and rust-resistant paint known by the trade name of 'Pabcoat.' Visitors to the Panama-Pacific International Exposition of 1915 will recall the beautiful stone veneer employed to such good advantage on so many of the

FIG. 2. TEST ON 10 LOADED PLAIN-BEARING MINE-CARS

plain-bearing cars. The 164 cars in the above example would require an additional investment of about \$20 per car, or \$3280 based on prevailing prices. This is balanced by the saving in the size of the locomotives. Each of the 8-ton locomotives costs about \$1000 more than one of the 3-ton

Exposition buildings. This was Pabcoat. It is a new and radical departure from any other protective or fire-resistant coating. It is a perfect adherent, is impervious to moisture, will not crack or peel, and is a demonstrated fire-resistant. The Mexican Gold & Silver Mining Co., operating on the Comstock Lode, Nevada, has used this paint for coat-

ing timbers in the transformer station on the 2200-ft. level, C. & C. shaft, in order to prevent a repetition of the disastrous fire that took place about two years ago, causing the loss of four lives. The opportunity afforded through the development of this coating will be appreciated by mine-managers, especially in these days when the cost of galvanizing and other forms of metal-protection is so high. Pabcoat is particularly valuable because of its adaptability to a wide range of uses. It is suitable for application to mine-buildings, steel or wood head-frames, steel or wood storage-tanks, and for underground timber or steel structures of all kinds, as well as any surface which is exposed to weather or moisture, as it is an effective rust-resistant. It may also be applied to galvanized iron without especially treating the surface. Inquiries for further particulars should be addressed to the Paraffine Paint Co., 34 First street, San Francisco.

### COMMERCIAL PUBLICATIONS

COMPLETE MAINTENANCE PAINTING SPECIFICATIONS FOR MANUFACTURING PLANTS, STORAGE BUILDINGS, AND POWER HOUSES. Detroit Graphite Co., Detroit, Michigan. This publication is more of a text-book than a trade catalogue and is a valuable addition to the reference libraries of any engineer. The speci-

FIG. 3. RELATION BETWEEN TRAIN RESISTANCE AND SPEED OF COAL-MINE CARS (AVERAGE FIGURES)

locomotives, saving about \$2000. The 8-ton locomotive would require rails weighing 30 lb. per yard, while the 3-ton locomotive could get along with 20-lb. rails. The difference in cost amounts to about \$3500 for the example based on \$40 per ton and 5 miles of track.

fications have been carefully compiled and cover all contingencies that may arise in the letting and completion of any class of painting work for industrial purposes, including concrete floors; office walls and ceilings; structural steel; miscellaneous wood and iron work; radiators; piping for sprinkler systems, covered and buried; tanks, both steel and wood; hot surfaces; graphite; machinery; walls below grade; galvanized surfaces; roofs; wood-preservation; cottages, inside and out; and packing. One excellent feature of this publication lies in the reproduction of sample colors, showing the varieties of shade available for any purpose. The covering capacity of paints is also given in tabular form, showing the quantity of paint required to cover a given area of types of surface. This pamphlet is distributed without charge by the Detroit Graphite Co., Detroit, Michigan, to whom inquiries should be addressed.

GEARS AND SIDE RODS OF ELECTRIC LOCOMOTIVES ON AMERICAN RAILROADS. By G. M. Eaton. Westinghouse Electric & Mfg. Co., East Pittsburgh, Pennsylvania.

## THE DOAK OIL-ENGINE

Announcement is made that the Doak Gas Engine Co., Cunard building, San Francisco, has acquired the sole right to manufacture and sell oil-engines in the United States and its

the fuel and loss of power and efficiency. The quantity of oil ejected from the main spray is regulated by a governor to suit the load under which the engine is operating. The constant temperature at which the hot bulb is maintained enables the engine to respond to wide fluctuations in load almost instantly, although the engine may have been operating at a light load over a prolonged period. The fuel-valve operating mechanism is so arranged that it is a simple matter to time the opening of the fuel-valves. The time of ignition may be advanced or retarded at will, thus pre-ignition is impossible and it is unnecessary to inject water into the combustion-chamber under any conditions. The governor is of the centrifugal type, and controls the speed of the engine by regulating the stroke of the fuel-pump. The engine is provided with a two-stage air-compressor built integral for furnishing compressed air for starting and fuel atomization. The engine may be started readily by hand, should necessity arise. Compressed air is delivered by the compressor to air-bottles from which a supply of high-pressure air is always available for starting purposes. The Doak oil-engine has been proved to operate satisfactorily on any fuel-oil suitable for a Diesel engine. If necessary, by reason of local conditions, asphaltic-base oils as low as 18° Baumé and carrying 50% asphalt can be used. This necessity, however, seldom arises. The oil that has been found most satisfactory is a fuel-oil 23 to 24° Baumé, carrying not to exceed 25% asphalt and 1% sulphur. When using an oil of the latter characteristics, the manufacturers guaran-

DOAK OIL-ENGINE, SHOWING VALVE MECHANISM

DOAK OIL-ENGINE, SHOWING INTEGRAL AIR-COMPRESSOR

possessions under patents owned by Blackstone & Co., Ltd., of Stamford, England. The oil-engine manufactured by the Blackstone company in its present form is the result of many years experience, combined with the performance of their engines under working conditions. Thus the Doak company, through securing the American rights for the manufacture of this engine, is enabled to offer to American power users an engine that has been perfected and has proved its worth through many hundreds of engines in every-day use. The Doak oil-engine, as it is known, is of the low compression, so-called semi-Diesel type. Ignition is effected by means of a hot bulb. The essential feature of the Blackstone patents consists of the use of two fuel sprays, called the ignition spray and the main spray. The ignition spray is directed against the hot bulb by which it is ignited. The ignition spray is directed across the path of the main spray, and ignites it. The quantity of fuel used by the ignition spray is fixed at all times, thus constant temperature is maintained for the hot bulb under all conditions of load. The importance of this feature cannot be over-estimated as users of the ordinary type of hot-bulb engines have experienced much trouble through a drop in temperature of the hot bulb when the engine is operating under fractional loads, causing incomplete combustion of

tee a fuel consumption not to exceed 0.5 lb. at full load and 0.6 lb. at three-quarter load. Actual experience has proved the above figures to be conservative.

Power users may thus obtain an oil-engine that has many advantages over existing types, without any of their disadvantages. The use of the hot bulb for ignition, combined with the features of constant temperature and practically perfect combustion at all loads, is one that will appeal instantly to those who have had experience with other oil-engines. The comparatively low compression and initial pressures maintained in the cylinder eliminate shock and excessive internal stresses and strains. Bearings will always run cool with a minimum of attention and permit a comparatively light construction, reducing installation and transportation-costs. The engine is constructed in both the horizontal and vertical types, adapted for stationary and marine service as well as for hoisting. The four-stroke cycle is used exclusively. The sizes range from 35 to 240 hp. The Doak company has been engaged in the manufacture of internal-combustion engines since 1889 and has established an enviable reputation for care and accuracy in manufacturing, which carries an assurance of satisfactory performance to prospective users of the Doak oil-engine.

Transporting Union Drill over 40 Mile Trail

## These Field Pictures Tell The Story

**The Union Prospecting Drill** is incomparably light and can be transported, handled and operated with an ease heretofore unknown for a drill having its capacity.

The Type B Drill shown in the bottom illustration weighs 2150 lb. Drills of this type are drilling 60 ft. ground and deeper, at the rate of 20 to 25 ft. a day, using 5-in. casing, which cuts a  $6\frac{3}{8}$  in. diameter hole. The engine burns  $\frac{1}{10}$  of a gal. of gasoline per hour.

Every Drill guaranteed.

*Prospecting  
for  
Gold*

CONGRESS has passed an act authorizing prospecting for potash salts on the public lands of the United States, except "adjacent to Searles Lake." Prospecting permits for two years and covering not more than 2560 acres each are to be issued and the patenting of not more than one-fourth of the land embraced in the prospecting permit is to be allowed. The Act stipulates that the deposits upon unsurveyed land adjacent to Searles Lake "may be operated by the United States or may be leased by the Secretary of the Interior under the terms and provisions of this Act." We give the full text on another page. This legislation has been urged as an emergency measure and as a war measure by the Secretary of the Interior and by the Council of National Defense.

THE president of the Butte & Superior Mining Co., Mr. Bruce MacKelvie, has stated that the Butte decision in the flotation suit was not unexpected, but he looks forward to the review of the case in the Circuit Court of Appeals. He considered that Judge Bourquin's requirement of a bond of \$2,500,000 was excessive and likely to compel a cessation of production at a time when metal is needed for the national service. We are glad to say that the judicial order has been modified since he spoke, so that the Butte & Superior company is now only required to deposit its monthly profits with the Court. He made another significant remark: "It is to be hoped that while the interests representing the Minerals Separation Company in this country are operating under the form of an American concern, the consistent attack on this company in the press as well as in court, particularly since the outbreak of the War in 1914, is not another way of reducing the available munitions supply for this country." This hints at German malice. We have heard the same suggestion from other quarters, but, prejudiced as we are against Minerals Separation, we do not hesitate to say that to the best of our knowledge such an idea is mistaken. It is true the firm of Beer, Sondheimer & Company acted as agent for the Minerals Separation and it is also true that this firm was placed on the British black list, but we have no reason to believe that the German affiliations of Beer-Sondheimer played any part in the selecting of that firm as the American agency for Minerals Separation, Ltd., represented now by

the M. S. North American Corporation. We have ascertained that the Beer-Sondheimer company is an American corporation controlled by Messrs. Elkan and Frohnknecht, natives of Germany but legally American citizens. Mr. John Ballot, the chairman of Minerals Separation, is an Afrikaner, a Dutchman born in Cape Colony; his close associate in the business, Mr. J. H. Curle, is a Scot of pre-eminent loyalty, who has devoted all his time since the War began to patriotic service; the next director, Dr. S. Gregory has been described to us as of Austrian extraction, but we are informed now that he is a Scot by birth, although of Armenian origin; Mr. W. W. Webster is English, and so is Mr. J. H. Krohn, his German origin having been eradicated except as to name. That disposes of the directors of Minerals Separation. The metallurgists, the firm of Sulman & Picard, are British, the junior partner being a graduate from the Royal School of Mines. In this country Mr. E. H. Nutter is a native Californian and a graduate of Stanford university; Messrs. Higgins, Chapman, and Wilkinson are English, Mr. E. B. Malmros is a Swede. Finally, to cinch the matter, the chief counsel, a most important person in such a business as that of Minerals Separation, is Mr. Henry D. Williams, a Yankee of the eighth generation. There may be some enemy-alien spots on Minerals Separation, but the core is British.

GENERAL satisfaction has been expressed with the price at which copper was fixed by the War Industries Board. It is not so low as to discourage production, even by the poorer mines, and it is not so high as to check consumption for useful purposes. The fixing of a price removes the premium on 'spot' copper and brings the market to a uniform level. The statistics of cost collected by Government officials have not been made public; so guesses continue to be made. One authority places the cost for a number of the bigger mines between 10 and 13 cents; another objects to the assumption that a price of 23½ cents allows a general profit of 10 cents per pound. Wages are now relatively higher, for the sliding scale is not to operate down-hill. Even if the Government had not stipulated for a maintenance of the existing wage-level, it is unlikely that the rate of pay could have been decreased without wide-spread labor troubles. Sliding scales are unfair arrangements,

because both parties do not equally play the game. Miners in Arizona are now getting \$5.15, whereas the sliding scale on the basis of 23½-cent copper would call for \$4.75 per shift; in Montana the miners are being paid \$5.25, whereas under the scale they could be receiving only \$5 per shift. However, none of us will grumble at that, if only they will do their work and join with the managers in a continuously active production of one of the sinews of war.

ON the 27th ult. Dr. R. L. Wilbur, the president of Stanford University, who has been one of Mr. Hoover's most valued coadjutors on the food administration, delivered an address before the Commonwealth Club. It is unfortunate that such utterances from such men are rarely given verbatim in the local press, whereas columns of piffle are printed with painful regularity. Dr. Wilbur said many things likely to provoke serious thought. For example, he stated that the enemy, Germany, controlled 235 millions of people and if that control over these people and their resources continued after the War, our country would be faced with a long and bitter struggle. He asked his hearers to imagine what would happen if the western battle-front 'cracked,' if the English and French armies were defeated; that line of defence meant as much to us as if it were at San José. Our naval and military efforts would not count immediately, although splendid efforts were being made, but there was one thing that we could do now most effectively to assist in the winning of the war, and that was the conservation of food. Our immediate task was to save and set aside enough food to supply the soldiers and the dependents of the soldiers of our Allies, to ensure that they were sustained, otherwise they would fail in winning the victory without which our national effort would be inconclusive. The placing of an embargo on exports to the neutral countries, rendered doubly effective by our control of the coal necessary for ships departing from our ports, was one of the most important steps taken by the Government. We were rationing the neutrals, he pointed out, and under such restrictions as to prevent them from sending supplies across their borders to the enemy. That alone was worth a million men, for that many would have to be withdrawn from the battlefield in order to produce the supplies that Germany needed for the successful continuance of warfare. Dr. Wilbur spoke enthusiastically concerning the fine spirit and true patriotism shown by the leaders of agriculture and other basic industries in this country and at the same time warned us against the widespread German propaganda, signs of which were to be met at every turn, trying to hinder and to cripple the work of the National Government, in the control of food as in other directions. A carefully considered programme for the homes and public eating-places has been arranged by the Food Administration. If our people live up to this programme we can see the solution of our food problem and that of our Allies. Appealing to his hearers for support in the conservation of food, he said: "Three times each day

everyone of you must decide whether you will play Germany's game or America's."

## The School of Experience

In this issue we publish another of those biographical records from which so much of human interest can be learned. Our subject, Mr. Denis Mathew Riordan, is a veteran whose kindness of heart and wide sympathy with all that concerns the profession have kept him young amid the vicissitudes of a varied engineering career. That career did not start in the conventional way; he did not graduate from a school of mines or a university; he did not have an indulgent uncle to give him a job as soon as he wanted one; on the contrary, he had a struggle to reach even the lowest rung of the ladder that leads to promotion and success. A carpenter and the son of a carpenter, he began life with but little prospect of achieving his present place as an honored member of a highly technical profession. Perhaps he was fortunate in the time of his debut, for the Civil War was followed by a remarkable era of mineral exploration and industrial development. He followed Greeley's advice and came West, to grow up with the country that offered many chances to the intelligent and energetic; but first he did his duty as a good citizen by serving as a soldier. In these days when 'slackers' are not far to seek, it should be more inspiring than amusing for our young men to read of the boy that tried five times to enlist before he succeeded in getting into uniform. Those that know Mr. Riordan need not be told that the soldier-boy of 50 years ago is a keen patriot today and as eager to serve the national cause now as he was then. We met Mr. Riordan in Europe when he went thither on the 'Tennessee' to distribute the funds for American refugees and we recall that he avowed himself 'neutral,' but he used the word in an ironical way that left no doubt about his feelings on the subject—feelings strengthened by later events. He served a various apprenticeship: soldier, brake-man, shipping-clerk, carpenter, millman, miner, all of these occupations he tried before, at the age of 22, he obtained a position of responsibility as superintendent of a lumber-yard; but the call of the mine was insistent; he returned to Virginia City; and when 30 years old he won his first real promotion, becoming superintendent of a stamp-mill at Bodie. He tells the interviewer how he taught himself in his spare time, overcoming not easily, but slowly and laboriously, the lack of special training. We were not at Bodie in 1878, but from another we learn that Mr. Riordan was "a live wire" in those exciting days; he was ambitious and speculative; he was fond of hunting, proving himself a good scout but a poor shot; our informant remarks that "he had to shoot oftener and tramp farther than most of us, but he always got birds." Apparently he was persistent in small as well as big things. He was keenly interested in politics and local affairs, as he is now in national and world affairs; his mental horizon

has been enlarged, but it is full of movement as heretofore—never provincial, he asserts the best right of civilized man: to make all knowledge his patrimony. When working underground on day's pay he began to pick up scraps of mineralogy and geology. As a young man he had the good sense and the good fortune to make friends among the leaders of the profession and to learn from them by daily association more than books could tell. The reading of reports and technical writings was supplemented by an intelligent inquisitiveness. He was never afraid to acknowledge ignorance and always quick to ask questions. Here is a hint to our young men. Nothing is more foolish than the false assumption of knowledge, the intellectual 'bluffing' that checks the acquirement of accurate information. To realize ignorance and to be eager to correct it is the mark of the real student. Later, in his first experience with the General Electric people, Mr. Riordan was true to form; he refused to undertake work for which he considered himself unqualified; he was glad to avail himself of the assistance of specialists. His saying is true that a mature man, if intelligent and honest, knows his capabilities and his limitations, and is wise if he recognize them. He knew his own and that made him a safe adviser. Our readers will note with keen interest the names of the mines he selected as likely to become profitable enterprises. Any man might be proud of such a record. It was the result of native sense, keen observation, and wide information. Again there is a lesson for our young friends: the proper study of mankind is man, to know men is better than to devour books, the understanding of one's fellows is capital of an indestructible kind. The interview also suggests that men differ greatly in their capacity to be helped by their surroundings; some sink to the bottom, others swim to the top. "Men live their future now. They determine by today's behavior and aspiration the strength or weakness that will tomorrow honor or shame them." Such is the moral of this story; but no maxims can give to a man the genius of friendship. This our friend possesses, and it is the very crown of life. He has the social gifts of quick understanding and willing co-operation; more particularly the happy knack of making congenial persons known to each other, for work as well as pleasure. His friends know him to be a charming letter-writer and a winning teller of stories either by mail or across the table. The equanimity shown by him in times of trouble is largely the product of an essential sanity and of a philosophic temperament disciplined by a keen sense of humor. That salt is the savor for making palatable even the unpleasant happenings of checkered days. And one thing more this mining engineer possesses, and shares with his fellows freely: an innate kindness that has found fruition in acts of service to the less fortunate whose trails he has crossed. Many that read this will jump to affirm what we have just said, for in his trail across the waste places of the earth where mines are found there grow for him many flowers of grateful remembrance.

## Labor v. Mine Production

No student of affairs is able to explain the present labor situation by attributing it all to industrial discontent. Civilization involves discontent, because it also involves an advance in the standard of living, and thus the unfortunate thread becomes interwoven with the warp of progress. These things are inseparable from our economic life and will remain so until a wiser generation has found the way to cure a thousand defects in our systems of social organization. The demon of discontent we have ever with us, but the widespread labor troubles that now impair our efficiency in grappling effectively with the dominant issues of war are wholly exceptional. They are so manifestly a reaction from abnormal conditions that one is forced to consider them all, directly or indirectly, a part of hostile propaganda. It is significant of hidden motives that the same kind of interference with the operations of government appeared instantly in Brazil when her relations with Germany became strained. The phenomenon has been repeated in the Argentine republic at the moment when the senate and deputies of that country have accepted the Teutonic challenge, despite the restraint of President Irigoyen's cautious diplomacy. The recognition of international influences in these disorders necessarily requires that other considerations than those of mere economic adjustment must weigh strongly with our Government in restoring a safe working basis to meet the existing crisis. We are at war, and the production of raw materials and their manufacture is as vital a factor in the military programme as the conscription and training of soldiers. The methods of war must be as relentlessly applied to industry as to the discipline of the Army that is to do the actual fighting for the preservation of our country.

The sudden demands for an enormously increased output from mine and factory have intensified the peril of the situation. A real shortage of labor is apparent, and at a time when industry is crippled by this shortage the labor-unions continue to ask and to obtain a wider recognition of the eight-hour day. We have always been in sympathy with the movement for a shorter working day, and would be glad to see it generally accepted in principle, but this is an inopportune moment to attempt the carrying of that reform into effect. If we are to cope successfully with the strains to which the Nation is being subjected in the present struggle, it is certain that every true patriot must lengthen rather than curtail the amount of his daily service. He must be ashamed to take 16 hours rest out of 24 while his country calls for aid. If our statesmen, our legislators, our committees for defence were to trim their daily labor to eight hours by the clock, we would speedily be in the way of submitting to the same brutal invasion of our rights that has crushed and ruined Belgium. That means that every man would go to work at the point of the bayonet, that his choice of labor and hours would be derided, that he would receive only the bare necessities of life from his

military taskmasters. If any of us are so unpatriotic as not to respond willingly to the call of duty, if we must render our quota to the common good under compulsion, then it had better be under the orders of a peace-loving democracy that offers the assurance of future blessings and of a continuous social uplift. The labor-unions should take a long look ahead; in the free institutions of a popular government guaranteeing unrestricted and equal franchise, they should recognize the safe foundation for a social structure on which the principles of larger equity shall be more perfectly established. This end is surely not to be anticipated through a military autocracy committed to the policies of ruthless national and racial aggrandizement. The time has come when the menace of the future must force those entrusted with the government of this free republic to remind us that in time of war our enjoyment of the liberties of the civil law is by sufferance only.

We are not yet short of metals, but production must be maintained at an undiminished level or perilous difficulties will confront us. It is probably true that our manufacturing capacity is insufficient to handle all the iron and copper and zinc that is being mined, but that capacity is being increased, and these materials are absolutely essential to the conduct of the War. We shall need more and more of the manufactures into which they enter as the War progresses. Engineering enterprises more gigantic than have ever been seen are planned, and the longer the War lasts the more extraordinary will it become as a battle between giant machines, mechanical monsters that will make the creations of H. G. Wells' imagination seem tame and commonplace. We are becoming so accustomed to the extraordinary that we are no longer astonished, and we fail to realize how tremendous are the mechanical appliances that this war is calling into existence, but the fact is that the demand for all the metals will display from this time forward a rapidly rising curve. In the face of this it is disquieting to note a dispatch, couched in terms of jubilation, that the mines at Butte are working at 50% of their normal capacity. A pitiful fifty per cent! That is not the result of patriotism; it is the fruit of a misnamed organization, the Industrial Workers of the World. Again we read another dispatch from Clifton, Arizona, announcing that the shortage of labor is so severe that the great mines there cannot attempt to operate after September unless immediate relief is obtained. At Bisbee the Copper Queen and the Calumet & Arizona are struggling to maintain normal production with forces reduced by 40%. The managers have not so stated, but it must be apparent to every miner that the effort to maintain the regular output with 60% of the customary number of employees, when no changes in mining methods have been made, can mean only one thing, the curtailment of development work. That may be tolerated for a brief period in the face of critical necessities, but it may not long persist without provoking financial trouble and crippling the output of the pro-

erty. Mines, such as those at Clifton and Bisbee, are not developed by the drill, and the ore is not available for stoping without time-consuming underground preparation. The same cry of a labor shortage comes from Jerome, and at Ajo barely half the needed number of laborers is available, so that this plant, perhaps the most perfectly automatic of any copper property in America, is seriously hampered in its operation.

It is surely not patriotism that has drawn the men from these great mines; it is the I. W. W. and the pernicious influence that has spread from that centre of infection. It has bred an indifference to responsibility that duplicates in a remarkable degree the spirit that led to disintegration in Mexico when the weak Madero proved unable to administer a democracy that was ready to lapse into the extravagance of anarchy. To put it plainly, the working people do not take their contribution to the common welfare seriously. They are insubordinate to those whose duty it is to supervise them and to see that an economic result is forthcoming; when chided for inefficiency or for lagging, they reply that the union, not the foreman, sets the standards for them. Duty has dropped out of the scales, and the managers no longer manage; from necessity they are declining into mere persuaders, coaxers, cajolers of labor. The big business of the world is not done in that manner and never will be. The old Americanism, the sort that developed workingmen into great builders and organizers and producers, was founded on the principle of duty and of obedience to those whose function it was to manage the work in which they took their necessary part. The old Americanism did not shirk; it did not drop the hammer on the stroke of the clock; it regarded work as an expression of dignity, not the sign of servitude. It made freemen who loved their country because it represented liberty and opportunity and knew no such thing as caste. When the unions turn human labor into a mechanical operation to be run so many hours per day at a pressure governed by a wage-meter, and liken service for a stipend to slavery, the spirit of the old American has gone and the changed conditions call for new methods. We must save free institutions for the laborers whether they appreciate it now or not. After the country is safe we may proceed with the process of civic evolution. With one great steel plant of the United States Steel Corporation paralyzed by a strike, with the building of ships hampered by union opposition, with the output of copper threatened at the great sources of supply, we are driving toward disaster. The Government is dealing with the problem of regulating prices, which means reduction of prices and a better economic equilibrium, but price-regulation downward only hastens the producer toward the closure of his mines if he is harrassed at the same time by shortage of labor and impairment of service. It is not surprising that the Clifton mines have announced their determination to close. The same thing will become necessary at many places unless more effective measures are taken promptly by the Government.

## Physics of Flotation

The Editor:

Sir—In your recent valuable contributions to the discussion of the physics of flotation, I notice that you continue to lay great stress on the importance of lowering the surface-tension of water, in order to produce stable bubble-films.

An interested person, after reading through your articles is very liable to conceive the idea that the normal S. T. of water is too great for the tensile strength of the film, which therefore ruptures and allows the bubble to burst. Is not this an extremely misleading conception? My own opinion is that the actual intensity of the S. T. has very little, if anything, to do with the stability of liquid films. This opinion was considerably strengthened after noticing that a fine froth of beautiful silvery bubbles was produced by violently agitating some 'foul' quicksilver. Granting that the contaminant, whatever it was, lowered the S. T. somewhat, still it must have been several times as great as that of pure water.

Looking at the question from a purely theoretical point of view, is it not permissible to regard the S. T. of a liquid merely as the reaction from the cohesion of its molecules? Starting with this hypothesis, it is only necessary to apply the fundamental physical principle that "action and reaction are equal and opposite," to arrive at the deduction that the intensity of the S. T. can have nothing to do with the rupturing of a liquid film.

Several enlightening articles on the theory of flotation have appeared in the technical press during the last few months, but any theory which depends largely on the presence of oil seems to me to be out of order, since, in practice, flotation plants have been operated successfully without oil, and it is quite a simple matter to prove in the laboratory that bubble attachment and levitation can take place when oil or oily substances are absent.

In attempting to apply the straight surface-tension theory to actual flotation-plant practice, a difficulty is immediately encountered. This theory, as presented in several excellent articles, always takes into account three surface-tensions, whereas in a flotation-plant, at the commencement of operations, there are only two in existence, namely, gas-liquid and solid-liquid. Before considering the other, namely, solid-gas S. T., is it not desirable first to describe how it is brought about? Yet I have failed to find an explanation in the writings of any investigator. If the casual observer thinks it is only

necessary to bump bubbles against solids in order to produce a solid-gas interface, let him try bumping a bubble, held in the ordinary bubble-holder, against a clean glass bead, and see what success he has in getting the air into contact with the glass. On the other hand, if he thinks that the bubble and the solid must be forced together in order to produce the solid-gas interface, let him move a bubble, ever so carefully, into the vicinity (say, within 1/100 of an inch) of a grain of shot coated with paraffin-wax, and try to pass it by without a solid-gas interface being formed. I think the result of these two simple experiments will prove that there is something which needs explaining before it is logical to start to explain flotation phenomena on the basis of three surface-tensions.

The explanation is probably so simple that none of the investigators have thought it worth while to put it into print, but in this connection, it is as well to remember that flotation is still very much a millman's problem, even if it has ceased to be a physicist's.

Holkol, Korea, August 18.

H. HARDY SMITH.

## Pneumatic Flotation

The Editor:

Sir—In your article in your issue of May 17, entitled 'History of Flotation', and which has since been repeated in your and Dr. Ralston's book 'Flotation', you have omitted, in detailing its history in the United States, to make mention of the pneumatic flotation plant erected by me for the National Copper Co. at Mullan, Idaho. The construction work on this plant was started on August 4, 1913, and went into operation about April 10, 1914. Its capacity was 500 tons per day.

The flow-sheet employed was published by me in my 'Notes on Flotation', American Institute of Mining Engineers, February 1916. An early description by Ernest Gayford also appeared in the 'Engineering and Mining Journal' about June 27, 1914. A large number of people visited it in operation, including many prominent metallurgists, mining engineers, and managers. The plant contained ten Callow pneumatic cells.

I would like again to point out that this was a most significant installation, since it was the first plant employing pneumatic flotation in any form, either in this or any other country, and the phenomenal developments that have since that time taken place, in this form of flotation, date from the original disclosures made in this plant. The flotation process employed at this plant was

the forerunner of the present flotation practice of the Inspiration, the Miami, Magma, Arizona Copper Co., Calaveras, and the many other users, both large and small, of pneumatic flotation which have since followed this lead.

I shall be glad, therefore, if, in justice to me, you would give the necessary prominence to this fact, as I do not think the history of flotation in America is truthfully complete without some mention of it.

Salt Lake City, September 25. J. M. CALLOW.

[We take pleasure in publishing this criticism and correction. We accept Mr. Callow's statement as a part of the history of the process.—EDITOR.]

## Magnetite and Copper

The Editor:

Sir—If your far-distant readers are to take part in your discussion columns, their contributions must necessarily be belated, but, unless chiefly controversial in character, they should be of interest, and seldom quite out of date. That is my excuse for this letter.

In your issue of March 3, W. H. Storms, commenting on the occurrence of magnetite with copper and iron sulphides, mentioned by you in the issue of February 24, says: "I am under the impression that this association is more common than is generally supposed." I think he is right. In Australia the association is frequent, and occurs in widely separated localities, in several well-known mines in Southern Australia, in New South Wales, and in Queensland. In Queensland, in the Dawes range at the back of the port of Gladstone, there extends for over 50 miles a contact-metamorphic series of garnet-rock, crystalline limestones, magnetites, and hematites, containing iron and copper sulphides. Weathering, under a tropical sun, has made spectacular outcrops where the deep gullies, intersecting the series, cut across the copper-bearing portions of the garnet-rock and magnetite, and these outcrops have led, several times during the last forty years, to short-lived copper-mining 'booms'.

The garnets and magnetites carry, also, small quantities of gold. Having occasion, years ago, to examine several of the so-called copper mines of that district, and, the associated minerals being new to me, I searched all the literature available for enlightenment, and found, to my surprise, that the association is world-wide.

Apparently, where the magnetite may be considered subsidiary to the pyrite, there is a concentration of copper, and the mixture of magnetite and sulphides proves higher in copper than the average of the clean pyritic mass. Some of our biggest mines show this feature, and I think the presence of magnetite in large pyritic ore-bodies may be considered a favorable feature for copper. But in the massive magnetite bodies the copper occurs as veins running diagonally across the lenses of magnetite. Kemp, in his 'Ore Deposits', refers to the Cornwall mine, in Pennsylvania, as showing that characteristic, and in Europe there are similar instances. The deposits in the

Dawes range show the same feature, but the veins are nowhere large enough to make a profitable copper mine; and, I gathered that, except where the magnetite is mined as an iron ore as well, the copper veins, even in Europe, have not been worked commercially.

It would appear, therefore, that copper and iron sulphide, forming distinct veins in massive magnetite, are not likely to become important mines.

In your issue of April 28 you refer editorially to the 'daylight-saving' movement. That passed through this country, and a 'Daylight Saving Act' was passed and put into force, last year, in the Commonwealth. The experience was not generally approved, and the Act is to be repealed. This is contrary to European experience, where its adoption last year has been followed again this year. General opinion in Australia was in favor of the Act being passed, from which much benefit was anticipated. After trial, general opinion is against it. The explanation appears to be that the advantage, or otherwise, is all a question of latitude. Australia, as a whole, is too near the equator. The disapproval was loudest in Queensland, and diminished as one went south. Probably the United States lies so far south of the latitude of European countries that the advantage found by the latter, in the adoption of a special 'summer-time', would hardly exist in the former. If one lives in a land where the sun rises at 3 a.m. in mid-summer, the question assumes a different aspect from what it has to those who live where sunrise is never earlier than 5 a.m.

EDGAR HALL.

Silver Spur, Queensland, August 31.

POLITICAL ECONOMY. 'The Financial Times', London, has this to say: Mr. H. C. Hoover, who when we first knew him was one of the shyest and most taciturn directors who ever faced a shareholders' meeting, is now getting quite a forceful speaker. In one of his first addresses as United States Food Controller he told the following effective story: "Germany's claim that she imports nothing, buys only of herself and so is growing rich from the war is a dreadful fallacy. Germany is like the young man who wisely thought he'd grow his own garden stuff. This young man had been digging for about an hour when his spade turned up a quarter. Ten minutes later he found another quarter. Then he found a dime. Then he found a quarter again. 'By gosh,' he said, 'I've struck a silver mine,' and, straightening up, he felt something cold slide down his leg. Another quarter lay at his feet. He grasped the truth: There was a hole in his pocket."

ELECTROLYTIC ZINC is gaining favor for galvanizing on account of the thin tough coating that this very pure spelter gives. It is also preferred in high-grade manganese bronze, aluminum alloys, sheet-brass, and die-cast alloys. The process results in the accumulation of residues rich in cadmium, but the demand is small, and metallurgical experimenters are urged to develop new uses for this metal.

# D. M. Riordan and the School of Experience

AN INTERVIEW. BY T. A. RICKARD

*Mr. Riordan, your name is Irish?*

It is. My father was Irish, and his forbears as far back as our records go. My mother was English. I am an American, having been born in New York state. Your question reminds me of the time my youngest grandchild came to her mother, crying, when she was about three years old, and amid sobs managed to say: "Ain't, ain't, m-my grandfawther of Irish decent?" Her mother responded soothingly that I was. Alicia's rejoinder was: "W-w-well, that's what I said, but Muriel says he is just plain Irish."

*In what town were you born?*

In Troy, New York, on June 26, 1848.

*What was your father's occupation?*

My father was a carpenter, of the kind the old country produced when they served seven years as apprentices before they were even allowed to become journeymen. He could do almost everything with tools in wood, except carving.

*What was your early education?*

I did not get much early education, but what I did get was in common schools, intermittently. I left school for good at the age of ten, and have never seen the inside of a school-house since, except as a visitor. I have worked to help out the family finances and to make my own living, continuously from the age of ten, in Chicago at first.

*You speak of Chicago. Your parents evidently moved from New York while you were a child.*

They did. My father decided to move to Chicago before any railroad had been completed, and therefore went around the lakes, by boat. Our family landed at Chicago in October, 1852. We lived there until I went into the Army.

*You first left home then to enter the Army?*

Yes, in 1864. But I started to enlist in 1861; I enlisted five times, but was taken out of the Army each time by my father, until the fifth enlistment. On the fifth I succeeded in getting into the field, in my 16th year.

*Did you see much of the Civil War?*

Not a great deal. I served with the Army of the Cumberland in the second separate division, mostly on detached scouting service in Missouri and Kentucky, and after being discharged I re-enlisted, which made the sixth enlistment, serving in Tennessee and Georgia, and was finally discharged at Memphis in 1865, after Lee surrendered.

*Were you in any battle?*

The only engagement of importance in which I participated was the battle of Nashville.

*Were you wounded?*

I was knocked down by a bullet, which struck the brass plate of my cartridge-box belt, but was not injured. *After the War, what did you do?*

I went into various occupations as opportunity offered, the first job being that of a freight brake-man on the Rock Island railroad.

*You were getting near the occupation of engineering?*

Well, you might look at it that way; I found that there was a decided reluctance to hire a man who had been in the Army. I never knew why, but assumed from the nature of the inquiry, as well as the manner of it, that most employers had the idea that a man who had been a soldier would not work at any regular occupation unless he had to. Therefore, I refrained from mentioning the fact that I had been in the Army until after I got a job and had shown my willingness, at least. I was particularly anxious to have this job of brake-man, although the work was hard, the hours long and irregular, and necessitating exposure to all weathers, because my 'bunkie' in the Army had moved to Davenport, Iowa, which was the end of my run, and I thus gained frequent opportunities for a pleasant visit with him.

*How long did you serve as brake-man?*

Probably four or five months. My father objected to the occupation, both on account of there being no likelihood of advancement, and on account of the danger.

*What did you do then?*

Upon leaving the railroad I succeeded in getting employment with Palmer & Leiter, which firm subsequently became Field, Palmer & Leiter, and then Marshall Field & Co. I worked as shipping-clerk with them through these changes, until the fall of '68, when I made up my mind to go West, being then 20 years old. At this my father again demurred, and offered to stake me to a store in Chicago if I would remain and cared to follow merchandizing as an occupation. But my experience in the Army and my natural bent for out-of-doors made me determined to strike out for the West. I liked to tackle Nature, rather than human nature; and the building of a railroad, the subduing of a forest, or the opening up of a mine, were even then dreams in my mind. So I went west in January, 1869, my first stop being at Bear River in Wyoming, whence I worked on the Union Pacific as a carpenter—being handy with tools, as the result of my father's training—until I reached Echo City in Utah. There six of us decided to leave the

railroad and go to Salt Lake City, inasmuch as the approaching completion of the trans-continental railroad was in sight. We went to Salt Lake, and after spending a couple of weeks there, all being carpenters and having our tools with us, we flipped up a half a dollar to decide whether we would go east or west from there. I did the flipping, and West won. So we bought a six-horse team and a wagon and started for White Pine, a booming mining camp in eastern Nevada. We passed around the southern end of the great Salt Lake and through Tooele across the Steptoe valley, which was then a quagmire, in which we spent three bitter days, thence through Egan canyon, until we made our way into Hamilton, White Pine district, Nevada. This was in 1869.

*And there your mining began?*

Only in a temporary way. I started to work as a carpenter at \$9 per day. Miners were being paid from \$5 to \$6. Everything was high; to illustrate: flour was worth \$36 per hundred, lumber \$300 per thousand feet, and all other things in proportion. It was a typical raw frontier mining camp in mid-winter. Most of the miners lived in tents or dug-outs, and a reckless good-natured lot they were.

*What were the principal mines in the locality?*

Up to the time I left there, there was nothing developed that could be called a 'mine'. There were innumerable holes all over Treasure Flat, anywhere from 10 to 50 ft. apart, but each claiming "1500 ft. on this lead, lode, or vein," and it was not at all unusual for a shot put into one hole to throw rocks that fell fairly into the next 'mine'. The ore was principally silver, and some of it ran as high as \$20,000 per ton.

*It was not long before you went into mining yourself?*

I did some prospecting on Treasure hill, but nothing that could be called 'mining'. I worked principally at carpentry. I left White Pine early in May, 1869, to go to Virginia City, where I arrived with \$1.60. I walked from Hamilton to Elko, something like 180 miles, and also from Reno, with my blankets on my back, to Virginia City, a distance of 21 miles, and on my arrival at Virginia City I took a glass of beer. This cost me 10 cents, and was all I ate that day. I then divided the remainder of my fortune into a three-day grub-stake, eating one meal each day while looking for work. I hunted faithfully for a job all the way from Virginia City down Six-Mile canyon to the Devil's Gate, and in all the quartz-mills down Seven-Mile canyon, but at that particular time there had been a fire in the Yellow Jacket group and the town was filled with idle men, many of whom were disgusted White Piners; others had come from the railroad-camps, the trans-continental railroad having been recently completed.

*So you had a poor show?*

A mighty poor show; but when my last half-dollar was under my belt, I decided, after consultation with Phil Smith, the foreman of the Kentuck mine, to go to Washoe Valley, which I did, afoot, and got a job in

Dall's mill at Franktown. I worked in that mill at different jobs, from feeding battery to amalgamator, but did not learn assaying at that time. In the fall of 1869 I went back to Virginia City, to work underground in the Chollar Potosi, of which I. L. Requa, father of M. L. Requa, was then superintendent. I worked in that mine until I was again persuaded to change my occupation, going into a store-office, and later, through the friendship of Capt. T. M. Hart, who was time-keeper at the Chollar Potosi, I was brought into a conference with H. M. Yerington, and within two hours installed in charge of the business of the Carson lumber-yard, in which duty W. O. Mills, a nephew of D. O. Mills, was my predecessor.

*This was at Carson City?*

Yes. My duties covered not only the Carson lumber-yard, but grew into the handling of the mills, large and small, that were cutting lumber at Lake Tahoe. When I first went to Carson, the Virginia & Truckee railroad had recently been completed from Carson to Virginia City. The rails and locomotives were hauled by horses from Reno to Carson. I can recall an argument between H. M. Yerington and William Sharon (who was then the agent of the Bank of California at Virginia City), when Yerington was importuning Sharon to support his recommendation that the road buy another engine. They had two engines, but Mr. Yerington insisted that they should have a reserve engine, and should have their trains so arranged as to start one from each end of the road practically simultaneously. Mr. Sharon demurred strongly, but Mr. Yerington's recommendations finally prevailed with Mr. Mills. At the time of this argument the railroad was being run without even a telegraph-line, but before I left the road it was running 40 trains per day and was easily paying 100% per annum.

*You are now referring to the Comstock boom, I presume.*

Yes, to one of them. From 1870 to 1872 there was a boom on the Comstock. Those who were there at the time will recall that Crown Point stock went from about \$2.50 to about \$2000 per share; and the shares of other companies, notably the Con. Virginia, Kentuck, Belcher, made almost equally phenomenal gains.

*Did you speculate yourself?*

I had no money for speculating. But only a few days ago I met Mr. A. M. Ardery, who was my chum, is now vice-president of the Virginia & Truckee and Carson & Colorado railroads, and is still my friend; he reminded me of the time we decided that we would put \$20 apiece from one month's salary into Crown Point stock. This would have bought us 16 shares at the price then prevailing. We flipped up a \$20 piece to decide the matter, the flipping decided against us, and we did not buy.

*How long did you remain at Carson?*

A couple of years. Then I went back to Virginia City and worked in the Hale & Norcross and other mines as a miner.

*What wages did you get?*

Four dollars a day.

*What did board and lodging cost?*

Board cost \$8 per week, and lodging anywhere from \$10 to \$20 per month. Many of us 'batched' and did our own cooking. I was one of three, all old soldiers and members of the same G. A. R. post, that batched in a cabin on the divide between Virginia City and Gold Hill. I had not been long in the mine, however, before Mr. Yerington met me one day and asked if I wasn't tired of such dangerous and heavy work, and if I didn't want to come back to my old position at Carson. This resulted in my doing so, and subsequently I was appointed station-agent at Mill Station in Washoe Valley, where I had a large flume under my direction, in addition to my routine work as agent. From there Mr. Yerington brought me back to his office, and although I had no title

ent, I served as assistant-superintendent of the Tioga and the Bulwer, and looked after all of the underground work of the Syndicate, and did all of the office-work for the three companies. My superiors were S. B. Ferguson and Warren Rose. My old foreman, John F. Parr, who lives in Berkeley now, and has since been in Alaska, Siberia, South Africa, and other mining regions, and is now mining in Tuolumne county in this State, was one of the most resourceful men I ever knew. We were 120 miles from a railroad. We had odds and ends of six different plants collected from among the idle mills of the then deserted camp of Aurora, in Nevada, and put together in an old mill-building. Mishaps of all kinds were continually occurring, but no excuse would be accepted for allowing the mill to shut down, and we prac-

OLD-FASHIONED PRAIRIE-SCHOONER TYPE OF TRANSPORTATION. HAULING SUPPLIES FROM REDDING TO THE LA GRANGE MINE

I acted as private secretary for him until he asked me one day how I would like to go to Bodie.

*When was that?*

That was in '78. I don't know whether Mr. Yerington knew I had previously had quartz-mill experience, but I was put in charge of the Syndicate mill at Bodie. There was no job in the mill that I couldn't do with my own hands, but I recognized my deficiencies in that I had no knowledge of assaying or metallurgy. I decided to correct this, and made an arrangement with a Freiberg graduate, who had an assay-office in Bodie, to teach me how to assay for gold, silver, and copper. In pursuance of my ambition to learn, I performed my routine duties until half-past nine or ten in the evening, then went up to Bodie, about a mile and a quarter, and worked until eleven or twelve, as the case might be, then back to the mill, and to bed, and was usually on deck again at half-past five. In addition to my duties as mill-superintendent,

I tically had to run it on 'rawhide and wire', and did. Shoes and dies were obtained from Pittsburgh at a cost of about 15 cents per pound. Wood cost \$12 per cord. Other supplies in proportion. We had an old 40-ft. two-flue boiler, and an old marine engine, 18 by 40, slide-valve; yet with all these handicaps we managed to keep our milling cost down pretty low—to within \$6 per ton, and sometimes as low as \$5.

*What was your total cost per ton?*

We ran mostly on custom ores.

*Then you made a profit?*

Oh, yes. We received \$12 per ton for doing the work. During this time we had one rather unusual run on ore from the Bodie mine, and from this run we produced about a million dollars in six weeks. We seldom could run more than two of the 5-stamp batteries at a time, and frequently only one, because the ore was so rich that

it kept the tanks, pans, and settlers full of amalgam. I have frequently known the amalgam to cling to the pan, shoes, and mullers so as to slow down the engine until it would stop on the centre. Any mill-man who lives near enough to his mill to have it become a part of himself will realize that if a stamp goes wrong, or a belt breaks during the night, it will bring him up out of a sound sleep into the middle of the floor standing, almost before he has time to recognize what the sound is. Therefore, any old-fashioned millman will recognize the fact that an unusual sound caused by one of the stamps going wrong would cause me to hurry on my clothes and go out to the mill to find that sometimes the stamp was not striking ore, neither was it striking iron, but that the bottom of the mortar had become filled up to and above the level of the dies until the material overflowed onto the dies themselves, and that the stamp was falling on malleable gold, deadening the sound. Under such circumstances I have removed the screen and filled a Wells Fargo express-box full of gold from one mortar. Pretty good ore!

*This ore came from the Bodie Consolidated?*

Yes. We got 900 pounds of gold amalgam one day.

*How much of this was gold?*

About one-third was metallic gold. During the run on this Bodie ore, I now remember sending a message to Mr. Yerington, who was treasurer of the company, announcing the recovery for that day. He made the remark, "Riordan is probably excited. He speaks of 900 pounds of gold amalgam, but, of course, he means ounces. But that's good enough." I did not mean ounces; I meant pounds.

*What was the yield of the ore per ton?*

It averaged about \$1000 per ton; but some of it ran as high as \$50,000 per ton.

*Was it a pocket?*

It proved to be a pocket; and it was opened up quite accidentally, against orders. The Bodie company had sunk a shaft to the depth of 250 ft. on the south end-line of the Standard mine, with a horse-whim. At that depth they started a cross-cut and intersected some 17 veins. The principal vein, which was the Standard main vein, was very low-grade at that point; but one of the night-foremen, finding some pieces of quartz showing free gold in a vein about 18 inches wide, afterward called the Burgess vein, decided, without orders, to start a drift south on that vein. In 27 or 28 ft. this drift widened out to about 9 ft. and was filled with gold-bearing quartz, the ore running thousands of dollars per ton.

*What was the later history of the Bodie mine?*

That I cannot tell without making fresh inquiries, because I left Bodie in the fall of 1880 and went to Arizona. I only know that before this phenomenal run the stock was selling at about 50 cents per share, and that it increased in value on the market to \$50 per share, and before the 'pocket' was exhausted it began to pay dividends at the rate of \$5 per share per month. I went

down to Arizona as the result of a proffer of a position as superintendent of a mine in what is now, I think, Cochise county.

*Where was the mine?*

It was in the southern end of the Santa Rita mountains. Prior to my leaving Bodie, a number of samples of the ore were sent to me there for assay, together with maps. The samples went within \$1 or \$2 of the amounts shown on the assay-certificates that accompanied them, and some of them ran over \$150 per ton. When I went down there to look the property over, I found that all of the maps and descriptions were accurate. But I also discovered that the ore never came from that mine. That fact had not been stated. So I refused to accept the superintendency of the property.

*How old were you then?*

About 32.

*What did you do next?*

The next thing I did was to spend several months with Fred F. Hunt, who is now an analytical chemist in New York City, and who was then covering the South-West in a search for possible copper opportunities for the Orford Nickel-Copper Company, with Thomas A. McElmell, an ex-naval officer, who was a member of the American Institute of Mining Engineers. We three were cabin partners and to a certain extent prospecting partners, especially McElmell and myself, although we had no formal agreement. I decided to take up a property adjoining the Copper Queen at Bisbee, and two business men from Iowa and myself formed a partnership and put some \$40,000 into this property in the search for copper ore.

*You had saved money from your salary?*

I had saved money from my salary and I had made several lucky turns in mining stocks, at both Virginia City and Bodie.

*So you were a capitalist?*

In a small way. I was always willing and ready to take chances and have been flush and broke perhaps twenty times, and expect to be broke again a few times before I pass in my checks. This copper mining venture at Bisbee not proving profitable, I tackled another prospect in the Silver Bell district, north-west of Tucson, a venture in which one of my previous partners and Senator Norwood, of Georgia, now deceased, were principals. The enterprise languished and finally expired for want of capital.

*What has since then happened to the prospects that you tackled both at Bisbee and Silver Bell?*

The prospect at Bisbee I do not believe ever developed into a mine, but the prospect at Silver Bell district was afterward developed by E. B. Gage and Frank Stanton, associated with Frank M. Murphy, into the Imperial Copper Co., which, I understand, has been acquired by the Guggenheims. From Silver Bell I went to Prescott, and there became associated with the then Governor of Arizona, F. A. Tritle, whom I had known previously at

Virginia City. Governor Tittle, F. F. Thomas, and myself at one time had the United Verde property under option, but we had to lay down our hands for the want of \$14,000. This was before it had been examined by W. A. Clark. While associated with Tittle I made examinations of properties in the South-West and down into northern Sonora, as far as Altar. Subsequently, and perhaps growing out of our intimacy, I was asked by the Governor to take the agency for the Navajo Indians in north-eastern Arizona, because rumors had reached the trading-posts of discoveries of valuable minerals—gold and silver, lead and copper—on the reservation. The Governor wanted somebody in whom he reposed confidence to go up there and take charge of the Indians, as agent for the Government; and while in that capacity to ascertain whether the rumors were true.

*Before we proceed further, I shall ask whether you had been trying to supplement your practical experience with the reading of technical books?*

When I was a 'cub' miner, in Virginia City, a work-

ance, so that I never failed to elicit information from any one who was near me. Another thing that helped me was that, for a number of years, the members of the U. S. Geological Survey, many of whom I knew personally, including Major Powell, Arthur Davis, Prof. Thompson, and Prof. Hiller, camped in that part of the South-West where I happened to be, and I got the benefit of their criticisms and their observations, in many cases extending back 25 years, while sitting around camp-fires, and the information they imparted would be etched on my memory. In '82 I became a member of the American Institute of Mining Engineers, and learned more through my acquaintance with such men as Dr. R. W. Raymond, Anton Eilers, George W. Maynard, E. G. Spilsbury, John Stanton, and Charles Macdonald. Some of the younger men with whom I made friends were Arthur S. Dwight, Karl Eilers, Dr. Spencer, and Dr. Hess of the Geological Survey, and such engineers as John B. Keating, Herbert R. Hanley, and others with whom I was in close association both in discussions over

BULLY HILL, LOOKING SOUTH-WESTWARD OVER THE RISING STAR CLAIMS

ing miner who knew five or six different kinds of rock was regarded as being something of a geologist. For instance, if he knew granite, limestone, quartz, porphyry, slate, and sandstone, he was regarded as being a fellow who was observant and a good judge of rock. I was always desirous to know the reason of things. In working in the lower levels of the Comstock in bad air I have had occasion to notice that the heat of the water coming from the face of the drift was sufficient to cook eggs. I wanted to know what made that water hot. On inquiry among men who had had a technical education, I learned that it was caused by the chemical reactions in the rocks themselves when exposed to oxidation.

*What books did you have?*

Usually none, because of my wandering life. I did manage to get hold of Dana's 'Mineralogy', and occasionally I would have my attention called to some book on geology by such men as Fred Hunt, who knew; and I made it a habit to make a humble exposure of my ignor-

practical operations, as well as technical methods.

*Then, Mr. Riordan, you got your technical equipment from nature and from men, rather than from books?*

Exactly so. Or, to put it in another way, I got it from hard knocks and absorption. My books were few.

*You have given me the impression that you read a great deal now.*

Yes, I do now, but then I had neither the time nor the facilities. Some sixteen years ago I was asked by the General Electric Company to analyze for them 700 or 800 mining reports. I have never quite known how they came to hear of me. But I took up the task, and out of the 700 or 800 badly mixed manuscripts I picked seven mines that I thought were worthy of investigation and recommended that they get some high-class engineer to make the investigations; but, instead of doing this, they gave me authority to choose the engineers and have the investigations made. For a number of years I had a free hand in the making of examinations in various parts of

the continent, and naturally in company with these engineers, analyzing the facts they ascertained and giving me the reasons why, I was bound to get some of the knowledge they had acquired by study as well as by observation, but which I could not have got in any other way. Then when I found I lacked any information in any particular I would not hesitate to ask where I could get the original authority or the original source of information on this or that point. If I heard an ore spoken of as 'bornite', when I did not know what that mineral was, I made it my business to go and hunt it up. And thereafter that was fixed in my memory. Habitually for 15 years I read reports and articles on mining subjects from two to three hours each day, besides the work I did during office-hours.

*Thank you. That answers my question. Now we will go back to your acceptance of the agency on the Navajo reservation.*

I probably spent more time on horseback scouring all over the reservation than any agent who preceded me, and possibly more than any who has been there since.

*How long were you there?*

I was there about two years and a half, from early in 1882 until the middle of '84.

*What did you find?*

I did not find anything that could be called a hopeful prospect, but I did find an ingenious system among the Indians of getting samples of rich ore from the San Juan region or elsewhere in Colorado, taking a sample as large as one's head, breaking it into smaller pieces, and giving the pieces to a number of different Indians to show to prospectors. And this in turn developed a carefully devised scheme for awakening the interest of any 'tenderfoot' or even 'old-timer' whose ambition might be aroused by showing him a sample of this rich ore and describing in a rough way the course of a vein along a hillside and the kind of rocks on both sides of the vein. For giving this information the Indian usually had himself and party well supplied with flour, bacon, coffee, or anything he wanted that could be obtained at the trading-post. Then he would return to his own 'stamping-ground' and a few days later another Indian would come down with another sample and describe a mine in the same locality. Probably a month later the first fellow would return. Every time the Indian messenger showed up he was listened to eagerly and went back loaded with the goods that he wanted. Then the white man would name a time when the Indian would be prepared to take a party up there and show them the locality, and the day would be set and this man would come down from the heart of the reservation to Gallup, or some other point, meet the white man there, and two or three hours afterward another Indian was likely to come tearing in with his horse all covered with foam, with the word that the hearts of the Indians in that vicinity had grown 'bad' and that it was not safe for the white man to go into that region to investigate. They would work that scheme with ingenious variations, until I exploded the

bubble. Governor Trible's idea was, if any valuable mineral was found, to negotiate with the Indians for a right-of-way for a road from the most available point on the railroad or the nearest white man's wagon-road, and thus avoid any conflict, setting aside the district for mining purposes with an amicable arrangement that was fair to the Indians. But, of course, the failure to discover valuable minerals in quantity spoiled everything.

*Then?*

Edward E. Ayer, of Chicago, who was probably the largest tie and telegraph-pole dealer in the world, and who had a saw-mill at Flagstaff, telegraphed me while I was at Washington with a party of Indians visiting the Secretary of the Interior, to call and see him on my return journey. His first question was: "Do you know anything about a saw-mill?" I said, "Not a damned thing." He said, "You are just the man I want." That resulted in my running the lumber business until Ayer invited me to come to Chicago at \$10,000 a year as manager of a part of his business and a half-a-dozen superintendents under me. This was in 1887. I told him I would rather make a success of that old mill out at Flagstaff and get \$1000 a year than to be in Chicago at \$10,000. I said I would make a success of the business if it was humanly possible, or leave my bones in the pile of saw-dust. So he sold me the mill, and the only security I could give him was my bones and clothes. Inside of two months I lost \$18,000 through the failures of customers; inside of two months more I started in helping to build what was then known as the Arizona Mineral Belt Railroad; I trusted the company to the extent of \$40,000, and then the silver panic of '93 came, and the Atlantic & Pacific Railroad went into the hands of the receiver, owing me the \$40,000. The lumber business proved a trial all right; but it never failed. It had taken me over 11 years to work out problems that I thought I could solve in three. Even at that time labor controversies were not unknown; and while we had no serious troubles I decided to put into effect a profit-sharing plan that I had thought over for years, the idea having been suggested by Dr. Edward Everett Hale. It would be too long a story to tell you now, but some day we may have a chance to talk it over. It is sufficient to say that my effort ended in a heart-breaking conspiracy among the beneficiaries, and rather than endure the continuing disappointment, I disposed of my remaining interests, at a sacrifice, and left that region, completely cured and freed from illusions on profit-sharing in this country under present social conditions. In leaving Flagstaff I had been encouraged to go to the South, where E. P. Ripley, president of the Santa Fe, and his associates, had an uncompleted railroad from Macon to Savannah.

*What did you do there?*

I went over the portion of the road that had been completed from Macon to Dublin, which was then earning a profit over operating expenses, but not on the bonded issue. It was a good road, if backed up.

*What was your work?*

It was in the nature of preliminary investigation, for the purpose of advising the owners and making up my mind whether I would take the presidency of the road. However, I had not gone far before I discovered that while Mr. Ripley, Mr. Soper, and their associates had apparently unqualified confidence in my ability to perform the physical task of completing the road, their chief desire to have me accept the presidency was based upon their belief that I could finance the completion; inasmuch as I had previously succeeded in getting some heavy undertakings of a similar nature financed—that is, heavy for me.

*What did you decide to do?*

I decided not to accept the presidency, although I told them plainly that if the road were financed I would un-

*Did Hewett buy it?*

He did. I may say that I was introduced to him by Dr. R. W. Raymond, who is one of the staunchest and most loyal of friends. Two years of this work brings me to 1898, the year of the Spanish War. I went to Tampa during the preliminary rumblings and was there the night the Maine was blown up, on my way to Cuba to see things for myself; but I was stopped. My family was in Europe at this time, and I had been keeping in mind the possibility of a home in the South, but decided to give it up and return to the West. Upon my return to Arizona, I went to Tucson, and while there was invited by Epes Randolph and Eugene S. Ives of Tucson to become an investor in the King of Arizona mine, north-east of Yuma. At that time the four principal owners and stockholders were Randolph, Ives, Blaisdell of

THE BULLY HILL SMELTER, SHASTA COUNTY, CALIFORNIA

dertake to complete it and accept the responsibility of its direction. I left. Then I started on a horseback reconnaissance of the Southern States, from Washington to Tampa on the east, and as far west as Texas, and in the doing of this I spent nearly two whole years.

*Making a mineral exploration?*

Not necessarily, although mineral investigations were included in some cases. For instance, I examined tracts of land embracing some 50,000 acres on which there was poplar, pine, and the other merchantable woods of the Piedmont region, but on which it was also claimed there was gold, silver, copper, and coal. Among other tracts I examined was one of 25,000 acres, at the instance of Abram S. Hewett. This property had a wonderful growth of poplar on it, but it also had two horizons of coal that were probably fifty times as valuable as the timber, while Hewett's proposition was to buy the tract based upon the stumpage value of the poplar alone.

Yuma, and S. Morgan Smith, a manufacturer from Pennsylvania. The mine had been discovered by a man named Eichelberger and taken over under option from him by Randolph and Ives. Smith was an ex-minister from the South, and was the principal person who put real money into the venture, besides myself. I was elected president of the company, and had for manager a nephew of Marshall, the discoverer of gold in California, Thos. Marshall Irwin, a bright young fellow. He died while in our employ, in Arizona.

*What happened to the King of Arizona?*

We were not a happy business family. I was not long in discovering that each of the three Arizona directors entertained a very poor opinion of Smith, and of each other, except as they could combine forces to do up Smith without coming within the grasp of the statute law. And each expressed an opinion of the others, as I do when I do not want to be offensive and describe a man as a stew-

ard. For a good mouth-filling definition of a steward I would refer you to Kent's answer in the second scene of the second act of 'King Lear', to the question of the steward: "What dost thou know me for?" I wrote to each one of my associates repeating what he had said about the others and asking him if my recollection of his characterization was correct. In each case my correspondent replied that my memory was not at fault, whereupon I called a meeting of the board at which all were assembled and placed the correspondence before them.

*Were any of them armed?*

It is fair to assume that at least two of those present were heeled. But nothing happened other than that they became less acrimonious, and after some interchanges requested me to see if I could not do something to bring about the sale of the property. Then I told them they would either have to nominate other representatives on the board or secure another President and General Manager.

*What happened?*

They decided to give me an option on the property at a sum which was a good round figure for such a property at that time, but its subsequent development and production has apparently justified the price they then asked. However, I did not succeed in disposing of the property for them, and while I was in New York on other matters, in 1900, I was in the old Engineers Club on Fifth Avenue when I was asked by a representative of the General Electric Company to meet some of the directors with a view to examining into the feasibility of their searching for copper-mining opportunities. After a preliminary conference I was invited to examine a mine for which they had negotiated and upon which they had made a preliminary payment. This mine was in New Hampshire, not far from Berlin. I suggested that they send a high-class engineer to make the examination, and this resulted in A. R. Ledoux undertaking the task. When Dr. Ledoux was chosen I assumed that this would result in my not going, as I was not under definite engagement with these people; but they asked me to accompany Dr. Ledoux, which I did. While we were at the mine together, our investigations were independent of each other. After his return Dr. Ledoux made an elaborate report on the property. I made none; at least none in writing, and openly declared that I would not attempt to make a mining report either as confirmation or as correction of the report of a man of Dr. Ledoux's standing. I did not regard myself as competent. My habitual term, in speaking of myself, was that I was a sort of a saw-mill metallurgist, and my experience has taught me that I could not truthfully claim to be anything more. When a man has reached the age of 48 or 50, if he is honest with himself, and intelligent, he usually has made a pretty accurate mental analysis of himself. Others may flatter him and regard him as a very much higher-grade man than he does himself. Still others may have a depreciated opinion of him; but he

ought to know what he is, himself. And while I am bound to know that a great many men of the highest standing in the profession regard me as a competent man, nobody knows as well as I do myself how keenly I recognize my deficiencies. My training was of the most haphazard character, as you must have recognized already, and entirely the result of some previous experience growing out of my being plunged into the vicissitudes of the frontier under conditions which compelled me to undertake the running of a lumber-yard this year, building a piece of railroad the next, running a quartz-mill the following year, and perhaps appraising timberland the next.

*What happened to the mine in New Hampshire?*

My principals took my advice and forfeited the payment they had made, but I never made any report on the property. After Dr. Ledoux's report had been received, one of the directors came to me and asked me whether I intended to make a report myself, and I said, "No, I do not regard myself as competent to submit a report upon a mine which is intended either to confirm or to correct the report of an engineer of Dr. Ledoux's professional standing." Then the director asked me, "Will you tell me this? Will you tell me what you think of that mine? And will you tell me what you would advise us to do?" I said, "I will do that. I think the mine is not worth a damn. I advise you to forfeit the payment you have already made and make the best settlement you can with the entrepreneurs." The promoters of the mine were Dr. Edward Peters and a man named Elliott.

*Did that lead to your being retained by the General Electric Company?*

It did. There were turned over to me 700 or 800 reports of mines of all kinds and descriptions. I was asked to go through them carefully, and to select some one or more that I regarded as being promising. This resulted in my choosing six or seven—among which were the Shannon, in the Clifton district; another in the Cananea district; the entire Shasta county, California group; the Granby at Phoenix, B. C.; the Britannia on Howe Sound; the Wall property, in Bingham canyon, now the Utah Copper; and two or three others—the Tezuitlan and the Inguaran, in Mexico.

*Was it a question whether the General Electric people should purchase shares in companies operating these mines, or whether it should purchase the mines and operate them themselves?*

The idea was that the General Company would operate the mines themselves.

*How many mines did the General Electric Company proceed to operate and how did you select those they did operate?*

When I gave the directors who had the matter in charge, notably, C. A. Coffin, Robert Treat Paine, and Gordon Abbott, the list of mines and districts in which I thought the possibilities were sufficiently good to warrant an investigation, they asked me if I would under-

take to secure engineers to make the examinations. I told them I would, so we selected W. Lawrence Austin, Thos. Marshall Irwin, T. S. Mathis, who had previously made some examinations under the supervision of Ellsworth Daggett and Hinsdill Parsons; Matthew J. Walsh, E. Gybbon Spilsbury, Martin Schwerin, John H. Mac-

They were J. C. Smith, Capt. Berry of Globe, M. P. Freeman of Tucson; Charles Akers of Phoenix; T. G. Norris, Hugo Richards, and others at Prescott; and one or two each in Bisbee and Tombstone whose names will not come to me on the instant; and several old Comstockers whom I knew in Nevada.

THE LA GRANGE HYDRAULIC MINE

kenzie, and others. Usually, especially in the case of mines situated in our South-West, I knew somebody in the district who was familiar with local conditions and upon whom I could call for a preliminary opinion.

*Would you give the names of those who helped you in this way?*

*What mines did your company acquire?*

Upon the technical recommendations of Mr. Austin—and my endorsement, of course—our people decided to take up a number of mines and prospects in and about Hanover, New Mexico—the Ivanhoe group—and something like a hundred claims stretching along the rail-

road in what are known as the Upper and Lower Basins, in the vicinity of Fierro and Hanover, were put together under the name of the Hermosa Copper Company. My principal aim in making these recommendations was to establish a basis for the acquisition of the Santa Rita property, which was then owned by J. Parker Whitney, of Boston. In the early days of the Hermosa I had an exhaustive examination of the Santa Rita property made by John M. Sully. This examination cost us considerably over \$10,000, and included over 4000 samples from various parts of the property, and I unqualifiedly recommended that our people take the property over, but they failed to do this. The property is now owned by the Chino Copper Company, which has something like 80,000,000 tons of developed ore, according to the latest estimates; and the man who made the examination for us is the manager, Mr. Sully.

*What happened to the Hermosa?*

We started on the recommendations of Frank H. Probert, who confirmed all of Mr. Austin's previous recommendations, and decided to take the property over; but it did not respond to our work as was hoped. It is now being operated in a rather small way by lessees, and recently some of our people have been recommending that they rehabilitate the property and resume operations.

*What other properties did you acquire?*

The only other property we acquired was the Bully Hill in Shasta county, California.

*This has done well, has it not?*

It did well, very well, until the Government began to make trouble about the smelter-fume. The Bully Hill proved to be a good property, but my original recommendation was not the acquisition of the Bully Hill alone, but the combining of it with the Mammoth, and my still earlier recommendation was to take up the whole Shasta group of copper mines.

*Why was your recommendation ignored?*

That I am unable to say. But there was always a strong feeling among some of our important directors against the company going into mining at all, and a whispered negative would outweigh the strongest positive recommendation.

*When did you acquire the Bully Hill?*

In 1905.

*Were your headquarters in California?*

I kept my headquarters in New York, but spent from two-thirds to three-fourths of my time in the field.

*Aside from your mining activities for the General Electric Company did you engage in any on your own account?*

I did. As a matter of fact, I was always engaged more or less in mining activities in what might be regarded as a small way. But sometimes these ran into considerable amounts of money for one of my means. I

was always 'grub-staking' prospectors, all over the mining regions with which I was familiar. I directed some drift-gravel mining in Calaveras county, with Matthew J. Walsh as superintendent, after the investigation staff of the General Electric Co. was cut down to the minimum; and I also became identified with hydraulic mining in Trinity county, California, at the La Grange mine. I was treasurer and managing director of this property for a number of years, becoming its president after the death of Robert Mather, who went into the venture when he was president of the Rock Island. Pierre Bouery, a French engineer, was the manager of the property, and a mighty good manager he was. This venture proved profitable to all interested; subsequently the property was sold to English capitalists for whom Baron de Ropp was the managing director in this country. We took out over a million and a half dollars during our operating period of some seven years.

I have never been entirely out of mining operations for nearly 50 years; some of them treated me very nicely, some of them not so agreeably, but on the whole I have no cause for complaint. I put just about as much energy, just as much intelligence, and usually more money into the losing venture than into those that proved winners; and as I look back now, taking the whole series of ventures, by and large, I cannot recall one that I greatly regret having made.

*Does your connection with the General Electric Co. continue?*

It does. Some five years ago I resigned my position as president of the various subsidiary companies that had been formed and recommended that John B. Keating, who was the manager at Bully Hill, be elected in my stead. Mr. Keating is a trained metallurgist, a fine mining engineer, and an exceptionally good business man. It has always been my habit, and one out of which I derived a great deal of pleasure, to boost the younger men. I never consciously wanted to be the head of anything. I would rather be the trusted right-hand man to some man whose character and ability commanded my respect, than be the boss. And usually I preferred to have a younger man in the position of the executive head, rather than occupy that position myself. But from the time I began work with a pick and shovel and wheelbarrow, even where there were no more than two of us together, and even if the other man was older than myself, the boss always seemed to look to me for a lead. But when Mr. Keating took charge of the Bully Hill and other properties, as president, he and his assistant, Herbert R. Hanley, started to solve the Bully Hill fume problem by electrolysis instead of smelting. That work has been going on for over three years now, and is just about completed.

*You are going to erect an electrolytic zinc refinery?*

Our people are not, that is, not immediately, but the Mammoth company has passed favorably upon our process, after an elaborate examination by the heads of their metallurgical department.

*Can you tell me what process you are going to adopt?*

In most essentials, I judge, although I have not seen the Anaconda process in operation, it is similar to the method devised by Laist and Frick, although in some important respects prior to that. Mr. Hanley, who was the assistant-manager at Bully Hill, was the man who elaborated the process and who found out the way to do things which were sometimes baffling, and, under Mr. Keating's supervision when he happened to be there, they worked out the methods to the point where the process seemed sufficiently developed to invite the Mammoth people to examine it with a view to the erection of a plant.

*By the way, Mr. Riordan, I met you in London when you came over to aid the refugees at the beginning of the War.*

I remember. I was deputed by the Secretary of the Treasury to accompany the officials of the Treasury department to Europe, the entire party on board the 'Tennessee,' on which we sailed, being composed of representatives of the State, War, Navy, and Treasury departments.

*You were bringing money to aid American refugees in Europe?*

Yes. We took over \$1,500,000 of Government money, and something like \$3,000,000 of money that was hastily got together by the leading banks of New York, Boston, and Philadelphia, for a similar purpose.

*I remember your telling me how nearly the 'Tennessee' became the victim of a floating mine.*

Yes. It was a close call, although we did not know it at the time. The Dutch government provided one of the boats which were patrolling the coast to accompany us far enough out to sea to do the honors and to note the direction in which we sailed. The last time I went back to England from the Hook of Holland, it was reported that the boat that escorted us, after turning around to leave us, was sunk by a mine and went to the bottom. It is fair to assume that we had a narrow escape.

*You have now settled in California?*

I believe I have. I opened an office here last year, but I have been such an Arab on the face of the earth that for years I have not dared to count on a permanent residence. I have had to travel, until within the last year, probably 25,000 miles per annum for 20 years; and have wandered from the mines of Cariboo to Bolivia, and habitually crossed the Continent from three to five times a year. I probably traveled 30,000 miles in Arizona alone, on foot, on horseback, and by buckboard—most of it before the railroads entered the Territory.

*Have you any opinion regarding the future price of copper?*

My opinion is that the price of copper will hardly drop below 20 cents during the five years following the end of the War.

## Potash Production

More potash has been produced during the first six months of 1917 than was made during the entire year of 1916, according to the U. S. Geological Survey. In terms of available potash ( $K_2O$ ), the production from natural salt and brine amounted to 7749 tons; from alunite and dust from cement-mills and blast-furnaces 1867 tons; from kelp 2143 tons; from industrial wastes 2153 tons; and from wood-ashes 111 tons. The aggregate is 14,023 tons, and the value at the point of shipment \$5,864,039.

The Nebraska alkali lakes still lead, having yielded about one-third the entire production. There are now at least four important operators in this field.

The production from Searles Lake, California, would undoubtedly be materially assisted by passage of the legislation now before the House of Representatives dealing with the leasing of potash-bearing lands. Continued uncertainty as to the status of titles to this property has hampered the development of this important deposit.

No production is reported from feldspar or other silicate rocks, but considerable quantities of potash salts and potash-bearing fertilizers were obtained from the dust in cement-mills and blast-furnaces.

The production from kelp was about 15% of the total, as it was in 1916.

The prices quoted range from \$3.50 to \$6 per unit, a unit meaning 1% potash in a ton of the material as marketed.

The figures given indicate that the production for 1917 will exceed 25,000 tons of potash or two and one-half times that made in 1916. This is about 10% of the average normal yearly consumption of the country before the War.

MONAZITE is essentially a phosphate of cerium, lanthanum, and didymium, including small and varying quantities of thorium, silicon, and other elements. The mineral is yellow, varying in shade and tint from a light greenish yellow to dark honey-brown; it is somewhat translucent to opaque, and it is characterized by a resinous or greasy lustre. It shows no distinct cleavage, and is brittle, breaking with an uneven fracture. In the original rock it may show sharp edges and plane crystal faces, but as found in sand it is in rounded grains, intimately mixed with other heavy and resistant minerals, the most abundant of which are zircon, magnetite, ilmenite, and garnet. The monazite sands as found usually have to be concentrated, as the sands of this country usually carry less than 50% monazite. A compilation of analyses of the mineral monazite—that is, the pure selected mineral—has been made to serve as a basis for comparison of the value of monazite from different localities. The percentage of thoria present in the sand from which this monazite was selected can be obtained by multiplying the percentage of thoria in the pure mineral by the percentage of monazite in the sand.—U. S. Geological Survey.

# Drop in Pressure of Compressed-Air Hose

By WALTER S. WEEKS

Last year W. W. Sprague and E. H. Wisser, under my direction in the Mining College of the University of California, made a large number of tests to determine the drop in pressure that compressed air undergoes in passing through a 50-ft. length of commercial air-drill hose. These tests were made for the purpose of furnishing to engineers data that might aid them in selecting a hose.

Tests were made on  $\frac{3}{4}$ -in. and 1-in. hoses, which were lent by different manufacturers. The drop in pressure,

duct air with less drop in pressure than more rigid hoses. Wire-wound hoses are very rigid. They have the additional disadvantage of becoming closed when struck by a falling piece of rock. The inside of a wire-wound hose is often corrugated by the tight winding. These corrugations increase friction and constrict the opening.

If a 50-ft. hose is coiled in four or five coils the drop in pressure will be increased by about 17%.

Manufacturers rate their drills in free-air consumption at sea-level. The free air on the charts is at sea-level, so the rating given by the drill-maker is used to find the drop in pressure. The effect of the altitude at which the drill is used may be neglected.

The method of conducting the tests was briefly this: Referring to Fig. 3; air was supplied to a receiver (1) through a reducing-valve (2), which maintained the pressure at any desired figure. One end of the hose was on the receiver and the other end on a tank (3), which was fitted with a low-pressure nozzle (4), a water manometer (5), and a thermometer (6). From each end of the hose a small copper tube (7) led to a mercury manometer (8). The air passing through the hose was controlled by a valve (9) leading into the tank.

From a chart the water-gauge was determined; this signified that a given amount of free air was passing through the nozzle.

The valve in the tank was set so that this pressure was maintained in the tank. The difference of level in the mercury manometer gave the drop in pressure with a given amount of air flowing through, with a given pressure in the receiver.

POTASH occurs principally in the rocks and soils of the earth, where it is very widely distributed. Chemical analyses of rocks and soils show that potash ( $K_2O$ ) forms from 2.65 to 3% of the entire earth's crust. Most of it occurs in combinations that are insoluble or only slightly soluble in water, and so is not considered 'available' for use either in agriculture or in many large industries that utilize salts of potassium. From 10 to 15% of certain minerals, some of them, such as feldspar, very common, consists of insoluble potash. Potash occurs as chloride or possibly sulphate in ordinary sea-water; in smaller proportions in the waters of most streams and lakes, and in larger proportions in many natural brines. —U. S. Geological Survey.

FIG. 3. APPARATUS FOR TESTING HOSE

with the same amount of air passing through, varied somewhat with different types of hose. The charts given on the opposite page may be considered representative of an average hose. The pressure marked on each curve is gauge-pressure at the entrance of the hose. The drop shown on the charts includes the drop through the hose-fittings, which in each case consisted of two couplings and two spuds. An approximate test was made on the drop through the fittings alone, and the drop was so slight that it would have been a waste of time to pursue it further.

In addition to the data given by the charts a few more points may be of interest. The buyer should make sure that the hole in the hose is of the specified size. The hose with the most 'give' has the least drop in pressure, because when it is under pressure the diameter of the duct air with less drop in pressure than more rigid hoses, which have a layer of rubber between the wraps of duck, apparently have more expansion, and consequently con-

## Chemistry

Next to the work of creation itself, possibly the most marvelous achievements which have been wrought in material things on this planet have come as a result of

the utilization of chemistry in the creation of industries, agricultural and manufacturing, to which the world is now giving its greatest attention.

We have entered a world war which is in reality a war of chemistry and mechanics, largely of chemistry. When Germany invaded Belgium it awakened the world to a realization of the fact that this country, as others, had for years been dependent upon German chemistry for myriads of things which should have been produced at home. We were instantaneously cut off from a supply of potash, though we should have searched the world for potash or produced it from by-products, as we are now beginning to do. We were cut off from dyes, though there are more resources in this country

Fig. 1. Curves for 50 Feet of  $\frac{3}{4}$ -Inch Woven Hose with Sullivan Fittings Showing Drop In Pressure Plotted against Air Delivered at Different Pressures.

the work of the chemist. Indeed, chemistry would seem to come nearer to truly creative work in material things than anything else of which man knows. Leading in all human progress is the chemist. Whether it be dealing with the soil, increasing its fertility and enlarging the output of foodstuffs; whether it be in extracting fertilizers from the air with which to save civilization in the years to come from starvation by lack of food; whether it be in the creation of explosives or the making of dyes, the production of medicines or the thousand and one other things which enter into every phase of human activity, chemistry is the dominating power. In olden times—and indeed by many people of today—chemistry is sometimes associated with apothecary shops. For many years people thought that the chemist was a druggist or apothecary, and there are still some people in the land who associate these interests and do not realize the broader work of the chemist in every line of human endeavor. Without the chemist there could be no agricultural advancement; without the chemist there could be no manufacturing growth; without the chemist there could be created none of the drugs and medicines to alleviate human suffering. It is, however, largely due to

try for dye-making than Germany ever dreamed of having. We had permitted ourselves to be handicapped, and had we at that time been forced into war our aid would have of necessity been very small, because chemistry had not made it possible for us to do the things which

Fig. 2. Curves for 50 Feet of 1-Inch Wrapped Hose with Sullivan Fittings Showing Drop In Pressure Plotted against Air Delivered at Different Pressures.

are now essential to maintain war. Within the last three years, however, the chemists of this country have almost been born anew or, rather, a new birth has come to chemistry. Thousands of chemists have concentrated their attention with untiring zeal upon the opening up of new avenues for producing the things which heretofore were brought from other lands. They are seeking to make this country independent of Germany, to make it self-reliant and self-contained.—From the 'Manufacturers Record.'

# Mining Practice in the Joplin District

By H. I. YOUNG

**PROSPECTING.** \*Where ore is found at a depth of 100 ft., or more, the prospecting is done by churn-drilling. Machines driven either by steam or gasoline are used. The drilling is started with a 6-in. bit and the size of the bit is reduced, if necessary, as the hole is advanced. It is customary to drill holes from 100 to 400 ft. deep, but this is governed entirely by the position and formation of the ground. In drilling sheet-ground, close spacing of the drill-holes is unnecessary, but in narrow orebodies the holes are placed from 15 to 50 ft. apart.

After the orebody is reached, cuttings are taken every two or three feet, samples being sometimes obtained by pouring the water off the cuttings and taking a portion of the coarse material for assay. It has been found, however, that the sludge removed with the water may contain mineral. To overcome this, cuttings from each two or three feet are put in a container and after the water has evaporated, a sample for assay is taken by means of an automatic device.

Records of cuttings are kept in glass jars or glued on large cards. Drilling at present costs from \$1.25 to \$1.50 per foot. In normal times, the drilling cost ran from 75c. to \$1 per foot.

**DEVELOPMENT.** After proving the property by drilling, vertical shafts are put down to the orebody. The dimensions of the one-compartment shaft vary from 4 by 5 ft. to 5 by 7 ft. in the clear, the two-compartment shaft is from 5 by 10 ft. to 7 by 12 ft. in the clear. Recently a few three-compartment shafts have been sunk. The shafts are usually put down near the edge of the orebody, so that very little driving is required to open up the ground. The shafts are usually cribbed with 2 by 4 or 2 by 6-in. sawed timbers, which extend several feet below the top of the solid rock. The cribbing is lined vertically with 7-in. boards, which help to keep the shaft free from small rocks and water and permit faster hoisting. The cost of sinking a 5 by 7-ft. shaft, where from 100 to 500 gal. of water per minute is handled, to a depth of from 200 to 250 ft., is from \$25 to \$30 per foot. Usually two or more shafts are sunk on each project. The shafts are connected by an air-drift 5 by 7 feet.

In the Granby, Aurora, and Galena districts where ore is found at from 40 to 100 ft., the practice is to sink small shafts, very little drilling being required to prove the shallow orebodies. To increase the tonnage where working-faces are limited, a 7 by 8-ft. drift is extended ahead of the working-faces for 300 to 600 ft. and the ground opened up so as to permit the use of several

machines. Bore-holes are necessary for ventilation where this method is used.

**MINING METHODS** have been developed to suit local conditions. The orebodies, which are 8 to 40 ft. thick, lie in a horizontal plane and are usually found on one level. In parts of the district, however, two distinct ore-horizons exist, and as many as four separate ore-bearing strata, these being separated by relatively thick layers of hard barren rock, the several ore-seams being mined independently. Where the orebody is thicker than 16 ft., underhand stoping is practised, especially in the hard ore sheet-ground. Pillars are left at frequent intervals, the distance between pillars and their thickness depending on the nature of the ground and the thickness of the orebody. The ore is usually found in a hard flint formation, known as the Grand Falls chert, which lies between beds of limestone. The limestone formation is known as the Mississippian, and is overlain by the Pennsylvanian series of shales and sandstones. A comparatively small amount of timbering is required in the mining operations, as there is a cap of flint from 1 to 5 ft. thick. This makes a good roof. In some cases, the flint decomposes into what is known as 'cotton rock.' It is soft and white, and pillars of it must be spaced closely, and the roof arched. In sheet-ground from 10 to 20% of the ore-formation is left as pillars. These are sometimes trimmed, many of them being removed after the orebody has been worked out.

**DRILLING AND BREAKING.** Where the orebody is over 16 ft. thick, it is customary to employ the 'heading and stoping' method of breaking the ground. The heading is supported on 6 or 7-ft. posts. The face is irregular, which is necessary for good breaking. From five to seven holes are drilled at each set-up, and the heading is advanced from 15 to 20 ft. ahead of the stope. If the stope is more than 10 ft. high, a 'splitter' is drilled horizontally so as to relieve the stope-hole. In high stopes more than one splitter is used. Stope-holes are pointed below the horizontal in order to maintain a level bottom.

Where the orebodies are less than 16 ft. thick, the 'heading and overhead stoping' method is employed. A 10-ft. post is used to support a bottom heading, and from five to eight holes are drilled per round. The holes vary in depth from 10 to 12 ft., from 75 to 150 tons of ore being broken per round. After the bottom heading has been advanced from 10 to 25 ft., holes are drilled in the overhanging ore, which is blasted down cheaply. A comparison between these two methods is shown in Fig. 1.

Two types of air-drills are used, the 'piston' and the 'hammer.' In sheet-ground, where the dust is an important consideration, the hammer type of water-drill

\*Abstract of a paper to be read at the St. Louis meeting of the A. I. M. E., Oct. 1917.

has been used with success, showing a drilling efficiency 25 to 40% more than the piston-machine. Drills are operated with air at a pressure of from 85 to 100 lb. High-carbon hollow drill-steel is used with hammer-drills. Holes are started with a 2½-in. bit and finished with 1½-in. It is necessary to change the size of gauge in each two feet drilled, and it is sometimes necessary, in exceedingly hard ground, to use several steels to drill the two feet. Usually the drill-steel is re-sharpened in an underground blacksmith-shop. Mechanical sharpeners are preferred.

Table 1 shows the cost of drilling in a mine where the faces are from 10 to 16 ft. high, for four months of 1917:

TABLE 1

Tonnage broken.....	136,272	
	Amount	Cost per ton of ore
Machine-men .....	\$9,630.40	\$0.0706
Machine-helpers .....	7,940.45	0.0583
Drill-repairs .....	3,505.14	0.0257
Drill-steel .....	2,627.29	0.0193
Sharpening drill-steel .....	3,194.86	0.0234
Oil for machines.....	207.78	0.0015
Compressed air .....	6,168.63	0.0453
Air-hose and fittings.....	703.43	0.0052
Total .....	\$33,977.98	\$0.2493

**BLASTING.** After drilling, the holes are chambered and prepared for powder. Both ammonia and gelatin dynamite (30 to 40%) are used, in sticks of from 1 to 1½ in. diameter. No. 8 caps have been found to give the best results. Where hoisting is done on double-shift the powder-crew works on the second shift, and the blasting is done after the shift, so several hours is given for clearing the smoke. It is necessary to employ skilled labor, both on account of the high cost of explosives and for the safety of the men. The holes are loaded with charges varying from 25 to 150 pounds.

The cost of breaking is from 15 to 30c. per ton, according to the height of the working-faces. The items shown in Table 2 are for a 12-ft. working-face.

TABLE 2

Tonnage .....	136,272	
	Amount	Cost per ton of ore
Labor .....	\$4,006.20	\$0.0294
Powder .....	17,914.00	0.1314
Fuse .....	782.33	0.0057
Caps .....	217.62	0.0016
Total .....	\$22,920.15	\$0.1681

These costs are on powder purchased by contract, the present market price being 70% higher.

**SHOVELING.** After the ore is broken it is necessary to drill large pieces with a jack-hammer, and blast them. The usual practice is to shovel into tubs, which are commonly known as 'cans,' holding from 800 to 1200 lb. of ore. These are 30 by 30 in., 30 by 32 in., or 32 by 32 in., and are trammed to the shaft on small trucks. The shovelers use short-handle No. 2 scoops, an average of 20 tons per shoveler per shift being obtained. All shoveling

is done on contract, and shovelers earn from \$3 to \$7 per 8-hr. shift. Both the Thew steam-shovel and the Myers-Whaley shoveling-machine have been used underground to good advantage, but without a decrease in cost. However, if labor continues to become scarcer, it may be necessary to adopt this method to ensure steady production.

A number of mines have substituted cars for 'cans.' The cars hold from 1500 to 2000 lb. of ore; they are easier to shovel into, as they are less high than the cans. They are also more stable, which permits faster tramming. The cost of shoveling ranges from 20 to 25c. per ton.

**TRAMMING.** Several different methods are employed: by hand, by mule, by motor, and by rope. The selection depends on the length of the haul, the tonnage, and the grade. The tracks are from 15 to 24-in. gauge, the rail varying in weight from 12 to 30 lb. per yard. The trucks are made of wood or steel mounted on plain wheel and axle or on roller-bearings. The roller-bearing truck has been found economical. Where the haul is 200 ft. or less, the shovelers run the cans to the shaft, but for any distance between 200 and 400 ft. additional labor is required. Where a large tonnage is required, as in the sheet-ground mines, and the distance from the shaft to the working-face is from 400 to 1500 ft., mule-haulage is advisable. A mule will haul 100 tons 1500 ft. in an 8-hr. shift, at a cost of from 5 to 6c. per ton. In the large sheet-ground mines, where 1000 tons is hoisted in an 8-hr. shift, and ore must be hauled 2000 ft. or more, motor-haulage is necessary. The 6-ton gasoline locomotive is much used and does not spoil the ventilation. Rope-haulage is employed where the grade is excessive.

The costs in Table 3 show a comparison of gasoline-locomotive and mule-haulage for four months of 1917. The distance on locomotive haulage is 1750 ft. and on mule-haulage 700 feet.

TABLE 3

## GASOLINE-LOCOMOTIVE

Tons hauled .....	136,272	
	Amount	Cost per ton
Engineer .....	\$1,833.62	\$0.0138
Brakeman .....	1,659.12	0.0122
Oil for locomotive.....	239.27	0.0018
Gasoline for locomotive.....	1,458.10	0.0107
Repairs .....	2,063.39	0.0151
Car-couplers .....	2,241.65	0.0164
Total .....	\$9,545.15	\$0.0700

## MULE

Tons hauled .....	81,145	
	Amount	Cost per ton
Mule-driver .....	\$1,868.70	\$0.0230
Maintenance mules .....	406.68	0.0051
Car-couplers .....	964.56	0.0119
Car-greaser .....	470.37	0.0058
Total .....	\$3,710.31	\$0.0458

**HOISTING.** Three methods are used; cans, cages, and skips. The can is best adapted to the depth of hoisting

and to the tonnage of the average Joplin mill. Both steam and electric hoists are in use. The hoisting cycle is as follows: A trammer runs a loaded can to the side of the platform, the hoisting-cable is unhooked from the platform and attached to the load by the tub-hooker; this operation is done quickly, and without any signals to the hoist-man, who now picks up the loaded can, which swings over the platform, where the tub-hooker steadies it in the centre of the shaft. It is raised to the top of the derrick, where the hoist is placed. Here the hoist-man hooks a tail-rope, which is fastened in front of the shieve-timbers, to a ring in the bottom of the can. The

trams; some few aerial trams are used, but the level topography and short hauls have made the inclined tram most popular.

The cost of hoisting is between 6 and 7c. per ton; surface tramming costs 1c. per ton. Table 4 shows a distribution of hoisting-cost for four months in 1917:

TABLE 4

Tons hoisted .....	Amount	Cost per ton of ore
Hoisting-engineer .....	\$2,316.07	\$0.0170
Tub-hooker .....	2,115.57	0.0155
Cable .....	720.50	0.0052
Hoister-repairs .....	429.92	0.0033
Hoist-derrick repairs .....	110.85	0.0008
Shaft-lacing repairs .....	99.16	0.0007
Steam for hoister .....	2,744.92	0.0202
Slickers for hooker .....	140.30	0.0010
Oil and waste .....	73.16	0.0005
<b>Total .....</b>	<b>\$8,750.45</b>	<b>\$0.0642</b>

hoisting-cable is slacked, and the weight is taken by the tail-rope, causing the can to dump into the mill-hopper. The hoisting-cable is taken up and the tail-rope unfastened so as to allow the can to descend in the shaft. With practice a hoist-man and tub-hooker will become so expert at their respective operations that as many as 150 cans per hour can be hoisted from a depth of 250 ft. The record for the district is 1071 cans in an 8-hr. shift. Where two compartments are used for hoisting, the hoists are placed side by side at the top of the derrick, and the shaft is divided for its entire depth to prevent the cans from bumping.

In order to do the shoveling on the day-shift, and to secure a large tonnage, many of the operators hoist from several shafts, and tram the ore on the surface of the central mill-hopper by means of inclined surface-

PUMPING. The serious problem is not the amount of water to be raised, but the acid character of the water. It is seldom that over 1000 gal. per min. has to be pumped at any one mine. In sheet-ground the mines are connected so that many do no pumping at all, a central drainage company being formed. Many types of centrifugal pumps are used; the Pomona and Texas are favored for surface plants, the Texas being used for unwatering mines, while the large-gear duplex or triplex pumps are usually found in the underground pumping-stations.

COSTS. There is no uniform system of accounting. At present operating costs, which include mining, milling, pumping, miscellaneous, and administrative, are from \$1.20 to \$1.75 per ton of ore mined. On account of the high prices of supplies and the scarcity and inefficiency of labor, costs are gradually increasing.

MAGNETIC SEPARATION. C. E. Siebenthal of the U. S. Geological Survey states that roasting and magnetic separation continues to be the general method of eliminating the iron from the marcasite-blende ores of the upper Mississippi Valley district. There were nine roasting-plants in operation and one under construction in 1915. Some of these did custom work in addition to handling the output of the mines where located, and some did wholly custom work. By giving a very light roast, the pyrite is separated in a condition suitable for sale to sulphuric-acid manufacturers. An electro-static separator was built in this district in 1908 and operated until destroyed by fire in 1911. Though successful it was not re-built, possibly because it was more expensive than the roast-magnetic plants which also do good work. Moreover the atmospheric conditions in the district are not the best for such a process.

# Potash Exploration

## Full Text of the Act Authorizing Exploration for Potassium on Public Lands

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the Secretary of the Interior is hereby authorized and directed, under such rules and regulations as he may prescribe, to issue to any applicant who is a citizen of the United States, an association of such citizens, or a corporation organized under the laws of any State or Territory thereof, a prospecting permit which shall give the exclusive right, for a period not exceeding two years, to prospect for chlorides, sulphates, carbonates, borates, silicates, or nitrates of potassium on public lands of the United States, except lands in and adjacent to Searles Lake, which would be described if surveyed as townships twenty-four, twenty-five, twenty-six, and twenty-seven south of ranges forty-two, forty-three, and forty-four east, Mount Diablo meridian: Provided, That the area to be included in such permit shall not exceed two thousand five hundred and sixty acres of land in reasonably compact form.

Sec. 2. That upon showing to the satisfaction of the Secretary of the Interior that valuable deposits of one or more of the substances enumerated in section one hereof have been discovered by the permittee within the area covered by his permit, the permittee shall be entitled to a patent for not to exceed one-fourth of the land embraced in the prospecting permit, to be taken in compact form and described by legal subdivisions of the public-land surveys, or if the land be not surveyed, then in tracts which shall not exceed two miles in length, by survey executed at the cost of the permittee, in accordance with rules and regulations prescribed by the Secretary of the Interior. All other lands described and embraced in such a prospecting permit from and after the exercise of the right to patent accorded to the discoverer, and not covered by leases, may be leased by the Secretary of the Interior, through advertisement, competitive bidding, or such other methods as he may by general regulations adopt, and in such areas as he shall fix, not exceeding two thousand five hundred and sixty acres, all leases to be conditioned upon the payment by the lessee of such royalty as may be specified in the lease and which shall be fixed by the Secretary of the Interior in advance of offering the same, and which shall not be less than two per centum on the gross value of the output at the point of shipment, which royalty, on demand of the Secretary of the Interior, shall be paid in the product of such lease, and the payment in advance of a rental, which shall be not less than 25 cents per acre for the first year thereafter; not less than 50 cents per acre for the second.

third, fourth, and fifth years, respectively; and not less than \$1 per acre for each and every year thereafter during the continuance of the lease, except that such rental for any year shall be credited against the royalties as they accrue for that year. Leases shall be for indeterminate periods, upon condition that at the end of each twenty-year period succeeding the date of any lease such readjustment of terms and conditions may be made as the Secretary of the Interior may determine, unless otherwise provided by law at the time of the expiration of such periods, and a patentee under this section may also be a lessee: Provided, That the potash deposits in the public lands in and adjacent to Searles Lake in what would be if surveyed townships twenty-four, twenty-five, twenty-six, and twenty-seven south of ranges forty-two, forty-three, and forty-four east, Mount Diablo meridian, California, may be operated by the United States or may be leased by the Secretary of the Interior under the terms and provisions of this Act: Provided further, That the Secretary of the Interior may issue leases under the provisions of this Act for deposits of potash in public lands in Sweetwater County, Wyoming, also containing deposits of coal, on condition that the coal be reserved to the United States.

Sec. 3. That in addition to areas of such mineral land to be included in prospecting permits or leases the Secretary of the Interior, in his discretion, may grant to a permittee or lessee under this Act the exclusive right to use, during the life of the permit or lease, a tract of unoccupied non-mineral public land not exceeding forty acres in area for camp sites, refining works, and other purposes connected with and necessary to the proper development and use of the deposits covered by the permit or lease.

Sec. 4. That the Secretary of the Interior shall reserve the authority and shall insert in any preliminary permit issued under section one hereof appropriate provisions for its cancellation by him upon failure by the permittee or licensee to exercise due diligence in the prosecution of the prospecting work in accordance with the terms and conditions stated in the permit.

Sec. 5. That no persons shall take or hold any interest or interests as a member of an association or associations or as a stockholder of a corporation or corporations holding a lease under the provisions hereof, which, together with the area embraced in any direct holding of a lease under this Act, or which, together with any other interest or interests as a member of an association or associations or as a stockholder of a corporation or corporations hold-

ing a lease under the provisions hereof, or otherwise, exceeds in the aggregate in any area fifty miles square an amount equivalent to the maximum number of acres allowed to any one lessee under this Act; that no person, association, or corporation holding a lease under the provisions of this Act shall hold more than a tenth interest, direct or indirect, in any other agency, corporate or otherwise, engaged in the sale or resale of the products obtained from such lease, and any violation of the provisions of this (sec) tion shall be ground for the forfeiture of the lease or interest so held; and the interests held in violation of this provision shall be forfeited to the United States by appropriate proceedings instituted by the Attorney General for that purpose in the United States district court for the district in which the property or some part thereof is located, except that any such ownership or interest hereby forbidden which may be acquired by descent, will, judgment, or decree may be held for two years, and not longer after its acquisition.

Sec. 6. That any permit, lease, occupation, or use permitted under this Act shall reserve to the Secretary of the Interior the right to permit for joint or several use such easements or rights of way upon, through, or in the lands leased, occupied, or used as may be necessary or appropriate to the working of the same, or of other lands containing the deposits described in this Act, and the treatment and shipment of the products thereof by or under authority of the Government, its lessees, or permittees, and for other public purposes: Provided, That said Secretary, in his discretion, in making any lease under this Act may reserve to the United States the right to dispose of the surface of the lands embraced within such lease under existing law or laws hereafter enacted, in so far as said surface is not necessary for use of the lessee in extracting and removing the deposits therein: Provided further, That if such reservation is made it shall be so determined before the offering of such lease; that the said Secretary, during the life of the lease, is authorized to issue such permits for easements herein provided to be reserved.

Sec. 7. That each lease shall contain provisions deemed necessary for the protection of the interests of the United States, and for the prevention of monopoly, and for the safeguarding of the public welfare.

Sec. 8. That any lease issued under the provisions of this Act may be forfeited and canceled by an appropriate proceeding in the United States district court for the district in which the property or some part hereof is located whenever the lessee fails to comply with any of the provisions of this Act, of the lease, or of the general regulations promulgated under this Act and in force at the date of the lease, and the lease may provide for resort to appropriate methods for the settlement of disputes or for remedies for breach of specified conditions thereof.

Sec. 9. That the provisions of this Act shall also apply to all deposits of potassium salts in the lands of the United States which may have been or may be disposed

of under laws reserving to the United States the potassium deposits with the right to prospect for, drill, mine, and remove the same, subject to such conditions as to the use and occupancy of the surface as are or may hereafter be provided by law.

Sec. 10. That all moneys received from royalties and rentals under the provisions of this Act, excepting those from Alaska, shall be paid into, reserved, and appropriated as a part of the reclamation fund created by the Act of Congress approved June seventeenth, nineteen hundred and two, known as the reclamation Act, but after use thereof in the construction of reclamation works and upon return to the reclamation fund of any such moneys in the manner provided by the reclamation Act and Acts amendatory thereof and supplemental thereto, fifty per centum of the amounts derived from such royalties and rentals, so utilized in and returned to the reclamation fund shall be paid by the Secretary of the Treasury after the expiration of each fiscal year to the State within the boundaries of which the leased lands or deposits are or were located, said moneys to be used by such State or subdivisions thereof for the construction and maintenance of public roads or for the support of public schools.

Sec. 11. That the Secretary of the Interior is authorized to prescribe necessary and proper rules and regulations and to do any and all things necessary to carry out and accomplish the purposes of this Act.

Sec. 12. That the deposits herein referred to, in lands valuable for such minerals, shall be subject to disposition only in the form and manner provided in this Act, except as to valid claims existent at date of the passage of this Act and thereafter maintained in compliance with the laws under which initiated, which claims may be perfected under such laws: Provided, That nothing in this Act shall be construed or held to affect the rights of the States or other local authority to exercise any rights which they may have to levy and collect taxes upon improvements, output of mines, or other rights, property, or assets of any lessee.

Sec. 13. That the Secretary of the Interior is hereby authorized and directed to incorporate in every lease issued under the provisions of this Act a provision reserving to the President the right to regulate the price of all mineral extracted and sold from the leased premises, which stipulation shall specifically provide that the price or prices fixed shall be such as to yield a fair and reasonable return to the lessee upon his investment and to secure to the consumer any of such products at the lowest price reasonable and consistent with the foregoing: Provided, That such lease issued under this Act shall also stipulate that the President shall have authority to so regulate the disposal of the potassium products produced under such lease as to secure its distribution and use wholly within the limits of the United States or its possessions.

Passed the Senate August 10, 1917.

Attest: JAMES M. BAKER,  
Secretary.

# The Supply of Gasoline

By MILTON A. ALLEN

A shortage of gasoline has been threatened recently and it has been announced that if the consumption was not reduced voluntarily during the War, legislative regulation would be necessary.

Prior to the War the United States produced 65% of the world's petroleum. Since then the supplies of Russia, Rumania, and Austria have been cut off, thereby placing the burden of production upon the United States. Besides this there is the ever-increasing domestic demand.

In 1914 the marketed production of American petroleum was 250,000,000 barrels and this increased to 281,000,000 bbl. in 1915. Our estimated resources are 5,500,000,000 bbl., or 20 years' supply at the present rate of consumption. The future source of gasoline to supply the increasing consumption and to take the place of our depleting resources is a serious problem. Most of the crude petroleum yields only a small proportion of gasoline and burning naphtha or oils that lend themselves readily to being manufactured into gasoline by cracking. The Mexican, Californian, Texan, and some Mid-Continental oils are of this class. Gasoline must therefore be supplied by the high-grade paraffine-base oils. The best of these yield only 15 to 25% of refined gasoline and naphtha.

The Appalachian and parts of the Mid-Continental fields yield the bulk of these paraffine-oils, but this represents less than 40% of the total crude petroleum output in the United States. From this it is seen that our gasoline supply is limited and restricted. During the year ended June 1915 the United States exported 244,000,000 gal. of gasoline and naphtha that could have been diverted to home consumption. It will be interesting to consider the possible source of gasoline other than crude petroleum, casing-head gasoline, and cracked gasoline.

The sources from which oil can be obtained in quantity for making motor-spirit are natural bitumen, highly volatile coal (lignite and cannel), and shale.

Prior to the discovery of oil in this country in the 'fifties, the cannel-coal deposits of Kentucky were mined and the coal distilled as it is in Scotland today. The oil yielded excellent lighting-oil or kerosene, lubricating oils, and tar. Similarly the albertite deposits of Canada were worked and distilled. Both these industries were forced out of the market when natural petroleum was produced in quantity.

For many years the Scottish oil-shales have been distilled at low temperatures (1000° F.). The richer shales, from which as much as 40 gal. per ton was obtained, are now exhausted; the average yield is now between 20 and

25 gal. only. In the process of distillation used, a large yield (45 lb.) of ammonium sulphate is obtained. The small yield of gas is scrubbed and used in the distillation process and for power. The crude oil is refined, yielding naphthas, burning-oils, gas-oils, lubricating-oils, and paraffine-wax. In spite of the increased price of chemicals, the improvements in retorts and in recovery, together with the installation of electric power have enabled the industry to operate at a profit. It is a fact, however, that in depth the Scottish shale yields less oil.

Large quantities of natural bitumen, similar to albertite, are found in Utah, Oklahoma, and Colorado. It is estimated that there are 32,000,000 tons of uintaite in the known veins in Utah alone. Analyses of albertite and uintaite are given herewith:

	Albertite	Uintaite
	%	%
Volatile .....	60.0	56.5
Fixed carbon and ash.....	39.5	43.0
Sulphur .....	0.5	1.5

Experiments made in Scotland under working conditions showed a yield of 134 gal. of oil per ton of albertite. The yield of uintaite should approach that of albertite.

The market demands for cannel-coal are limited, hence the present output is small; it is used to enrich gas in gas-works and as a grate-coal in some localities. For this reason large areas of cannel-coal in Ohio, Kentucky, West Virginia, Indiana, and Tennessee have not been developed. These coals vary in volatile content from 35% to 54%, and in many instances they approach 60%. It is estimated that there are millions of tons of workable cannel-coal in Kentucky alone.

An analysis of a typical Kentucky cannel-coal shows

	%
Moisture .....	2.4
Volatile .....	50.3
Fixed carbon .....	43.3
Ash .....	3.4
Sulphur .....	0.6

This coal holds considerably less ash than the European cannels, hence the greater possibilities of disposing of the coke by-product if the coal is distilled like the Scotch shale. The coal residue could also be burned in producers and electric power generated on the side.

Experiments in distillation at low temperature of high volatile cannel-coal show that it yields from 35 to 60 gal. of dry tar-oil, the amount depending on the percentage of volatile in the coal and the temperature at which the destructive distillation is conducted. These cannel-coal tar-oils are high in paraffine, and the heavier fraction could readily be cracked to yield a high percentage of motor-spirit.

For many years in England cannel-coal was used in gas-works as an enricher; but if large quantities were employed the tar by-product was difficult to sell to the tar-distillers because of its high percentage of paraffine. This bears out recent experiments, except that the percentage of paraffine hydro-carbons is considerably increased when the coal is treated at a low temperature as in the Scotch shale distillation. The advantages of cannel-coal distillation for tar-oils over the Scotch shale would be that the residue or coke could be used either for power purposes on a large scale, sold directly, or ground and made into briquettes. Ammonium sulphate would be a by-product as in the Scotch shale industry and the yield would probably be large. Experiments on albertite yielded 65 lb. ammonium sulphate per ton.

Apart from the tar-oils the gas when scrubbed yields benzene and toluene and some light oils. The benzene and toluene could be mixed with some of the light oils similar to the use to which casing-head gasoline is put. Benzol has been used in France as a motor-spirit for many years.

In many of our central, northern, and western States, there are hundreds of square miles of lignite. Canadian lignite deposits, it seems, are inexhaustible. Lignite is useless there as a fuel because of its low heating-value. If the lignites are subjected to low-temperature distillation they will yield from 30 to 40 gal. of dry tar-oils, depending on the volatile content of the lignite and the temperature of the destructive distillation. The residual coke can be used similarly to that from cannel-coal.

In Nova Scotia, New Brunswick, and in our western States are large areas in which oil-shale is known to exist. These shales resemble the oil-shales of Scotland. Experiments made on shales from Nova Scotia and New Brunswick yielded from 40 to 65 gal. oil per ton, the ammonium-sulphate by-product varying from 67 to 110 pounds. The following is an analysis of these shales:

	%
Moisture .....	1.00
Volatile .....	45.32
Fixed carbon .....	1.29
Ash .....	50.69
Sulphur .....	1.70

In the Carboniferous system of Kentucky above the cannel-coal deposits are bands of shale similar in composition; also there are separate beds of workable shale. These separate shales show the following analysis:

	%
Moisture .....	0.9
Volatile .....	43.0
Fixed carbon .....	13.1
Ash .....	42.5
Sulphur .....	0.5

A yield of 75 to 85 gal. of oil has been obtained from French shale deposits having the following analysis:

	%
Volatile .....	44.4
Fixed carbon .....	25.0
Ash .....	30.6

No sulphur exists in the oil. This resembles a high-ash cannel-coal.

From the results given, it will be seen that the shales in almost all cases give a high yield of oil. Prior to the War the oil from the Scotch shale was not cracked for motor-spirit, but there is every reason to believe that this now is being done.

In crude experiments in the cracking of lignite tar-oils, after the extraction of the light naphthas, a yield of 40% of motor-spirit has been obtained. It can be expected that the tar-oils of cannel-coal and the shale-oils, which carry a larger percentage of paraffine-oil, will yield a larger percentage of motor-fuel on cracking, and will be more amenable to such treatment. The processes now being used in the cracking of petroleum in this country are the Burton, Hall, and Rittman. The Hall process is being applied successfully in England and Russia.

The War has created a demand for benzol and toluol that did not exist before. Therefore, they were not recovered in the by-product plants. It is doubtful if these products will fall below the price of gasoline after the War because of their value as motor-spirit. Gasoline will probably not go lower.

Considering the low costs of mining and treatment of the Scotch shales by the uneconomical method practised, it is difficult to see why the shales, natural bitumens, cannel-coals, and lignites would not yield large quantities of gasoline profitably at the present price, and at the same time develop resources that are idle for want of profitable use, by the adoption of a modification of the most recent continuous retorts of the Woodall-Duckham or Glover-West type to suit low-temperature work, together with a modern cracking plant.

A NEW METAL as light as aluminum and as strong as steel is now made in the electric furnace. It possesses unusual anti-corrosive properties also. The U. S. Government is testing a pump made of this new metal, for pumping sea-water. It is said to be a chemical union of aluminum with other elements and not an alloy. The name of the new product is 'acieral', probably from the French word *acier*, steel, with the *al* to signify aluminum, or 'steel-aluminum.' It is understood to contain about 92 to 97% aluminum, with 3% nickel and other metals. The chemical reaction is obtained by the use of a secret flux. Its color is white and it has a compact texture similar to the best steel. It is as sonorous as bell metal and has a good conductivity for use in electrical work. Castings made from it show high tensile strength, and when rolled into rods or sheets its strength nearly doubles. It can be cast in sand or die cast, with or without pressure, and it flows well when being cast. It may be forged hot or cold, and can be annealed, drawn, or rolled into shapes. It is resistant to all acids, hot or cold, except hydrochloric, and it resists oxidation by the air when damp, at all temperatures, even when salt is present. Its greatest use is for aeroplanes and automobiles. With aluminum selling at 60c. per lb., the new metal will sell at \$1. It was discovered by M. de Montby.

# REVIEW OF MINING

## SUTTER CREEK, CALIFORNIA

OLD EUREKA MINE.—WILDMAN-MAHONEY.—SOUTH EUREKA.

At the Old Eureka mine, preparations for active development are proceeding satisfactorily, and the portions of the shaft below the 1600-ft. station that had but one compartment, has been enlarged and re-timbered to a point 1900 ft. from the surface, leaving only 260 ft. to reach the bottom. By means of this work the entire depth of the shaft will have three

This company has made application to the Corporation Commissioner for authority to distribute \$60,655.50 to stockholders, their financial statement showing \$57,000 cash on hand and \$68,000 in marketable bonds. The group of mines adjoins the Eureka on the north and could be economically operated under one management. The Wildman-Mahoney and Lincoln mines are credited with a production of over \$7,000,000 and have been opened by means of four shafts: the Lincoln, 2000 ft. deep; the Mahoney, 1200 ft.; the Wildman, 1400 ft., and the Emerson, 619 ft. On the Wildman 1400-ft. level a vein 160 ft. wide, assaying \$3.50 per ton, is said to have been discovered shortly before work ceased in the Old Eureka. The expensive upkeep of the Wildman shaft was a large factor in preventing the successful mining of this orebody. The Emerson vertical shaft was sunk in diabase 1000 ft. east of the Wildman shaft with the object of cutting the vein at 2300 feet.

The South Eureka shaft is likely to be deepened. The working-force has been gradually reduced from 350 to less than 20 men. Those now on the pay-roll are engaged in keeping the shaft in repair, operating pumps, and getting the mine in readiness for sinking. While large deposits of low-grade ore are in reserve, it has become necessary to go deeper for sufficient good ore to mix with the low-grade. For some time, negotiations have been pending for the sale of the property and it is not yet known whether future development work will be done by the present company or by one of the companies that have recently investigated the mine.

MAP OF CALIFORNIA

compartments and the large skips can be used from the surface all the way. Three important levels have been re-opened with encouraging results, namely, the 800, 1200, and 1700. On the 1200-ft. level, about 265 ft. north of the shaft on orebody 30 ft. wide, assaying about \$25 per ton, shows in the face of the drift and gives indication of being the same vein as that on the 800-ft. level. Ore of good grade has been found on the 1700-ft. level. Some of the drifts and cross-cuts are caved, but in most parts of the mine the old timbers appear to be in an excellent state of preservation. Where deemed expedient, parallel drifts and cross-cuts will be run near the caved ground in preference to re-opening it.

Michigan capitalists, several of whom are interested in the Old Eureka mine, have made payment of part of the purchase price of the Wildman-Mahoney-Lincoln group and the Lincoln Con. Mining Co. will pay its stockholders a 10% dividend.

## CRIPPLE CREEK, COLORADO

CRESSON CON. AND GOLDEN CYCLE DECLARE DIVIDENDS.

The directors of the Cresson Consolidated have declared the regular monthly dividend of 10 cents, payable on October 10. A. E. Carlton, the president of the company, announced a net profit for August of \$220,000, and ore-reserves estimated at \$4,500,000, with ore in transit and cash in bank to the amount of \$1,280,000.

The monthly dividend of the Golden Cycle company, of 3c. per share, amounting to \$45,000, has been declared.—The Montana vein is reported cut at the bottom or 1650-ft. level of the Dillon shaft of the Granite mine, and ore of marketable value has been exposed. The company will defer development until such time as the lateral cuts the Bobtail vein, which extends into the Dillon from the Portland estate and is producing heavily on the 1550 and 1450-ft. levels of the Dillon claim.

The Hahnwald brothers, lessees of the El Paso Gold King, in Poverty gulch, were shipping again this week. New ore-bodies have been opened up in the deeper levels and sinking is now proposed. The El Paso Gold King shaft is 1000 ft. deep and it is proposed to sink a 250-ft. lift for a starter. Edwin Gaylord, lessee of the Forest Queen mine on Ironclad hill, is sinking below the 600-ft. level. He continues to ship from the caved ore between the 400 and 600-ft. levels; this ore averages \$15 to \$20 per ton.—The new Hurst shaft on the Ocean Wave, on Battle mountain, is being sunk with two shifts and the work will continue to 500 ft. The property is under lease to the Ocean Wave company.—The Unity Leasing Co., operating the Nightingale of the Stratton estate, is

sinking a new vertical shaft on Raven hill. The Nightingale extends to Bull hill. The south end of the claim adjoins the Maggie mine of the Cresson and the Gold Sovereign, both producing mines.

A depth of 500 ft. has been attained in the shaft on the Longfellow No. 2 of the Stratton estate and a station is now being cut at this depth. The property is under lease to the Excelsior company, which has opened up ore on the 500 and 600-ft. levels of the Golden Cycle mine. A cross-cut will be driven to this orebody from the 500-ft. level of the Longfellow. —The Dig Gold Mining Co., M. B. Burke president and general manager, has installed an electric hoist and compressor on the Alpha and Omega group on the southern slope of Gold hill and is now engaged in sinking the shaft from the 150-ft. point.

## SPOKANE, WASHINGTON

ENTERPRISE LEASED.—CALEDONIA AND STANDARD DECLARE DIVIDENDS.

With silver at over a dollar and prospects of further advance the silver-producing mines are in clover. The Interstate-Callahan and the Bunker Hill mines of the Coeur d'Alene may be taken as illustrations. The former earns from 3 to 20c. per ton with each cent of advance. This means that it receives \$1.59 to \$10.60 more per ton at present prices than two years ago. The Bunker Hill & Sullivan produces an average of 22 oz. per ton or \$11.66 more than two years ago, and the Hecla 26 oz. per ton of ore shipped, or \$13.78 per ton. Hecla would receive \$371,000 more for its annual output than two years ago. These profits are not net, for the cost of production has been increased.

The profits of British Columbia mines are greater. The crude and concentrated ores of mines in the lead belt contain from 30 to 90 oz. silver per ton. The price received is \$15.90 to \$47.70 more than the average price of two years ago. The mines of the dry belt in British Columbia average 200 oz. silver per ton. This makes the gross value more than \$205 per ton for silver alone, an increase of \$106 over the price of two years ago and an increase of \$74 for the current year.

With a score of teams and trucks, each hauling 10 tons of ore at a time, the American Minerals Production Co. is rushing shipments of magnesite from its quarries at Valley, Stevens county, Washington, without waiting for the railroad to be built into the district. The railroad will be standard gauge and have a length of 16 miles. Steel has been delivered for the first 4½ miles. A contract for the work is being executed by the General Construction Co., of Spokane. It will be fulfilled early in January. The line will be operated between Valley and the quarries. A connection will be made at Valley with the Great Northern. Grading has commenced.

Net earnings of the Slocan Star Mines, in the Slocan district, B. C., for August were \$4500, according to a preliminary estimate. This is about the same as reported for July. Shipments in September aggregated 110 tons of zinc and 40 tons of lead up to September 14. The carload shipped this month contained 60% lead and 100 oz. silver per ton. The Enterprise mine, in the same district, which Finch & Campbell of Spokane sold for \$375,000, has been taken over by a new company on a lease and option for \$125,000. The new company is the Seattle-B. C. Lead Silver Co., organized by H. F. Millard, of Valdez, Alaska. Finch & Campbell worked the property for many years, but a high percentage of zinc made the ore less profitable than was expected. The Spokane men sold the property to the British Columbia Mines Co., of London, which worked it profitably by hand-sorting. This company is now selling to Millard's corporation. It is said that the mine has produced about \$600,000 in the past. Mr. Millard estimates the ore in reserve at 40,000 tons; this will sort 10,000 tons and produce 3,891,000 lb. lead, 4,337,000 lb. zinc, and 182,400 oz. silver.

Another car of high-grade antimony ore, from the Pine Creek district, has been shipped to the smelter by the Coeur d'Alene Antimony Mining Co. Pine Creek is one of the few districts in the United States where antimony ore is produced. Its production is small, but better prices for the metal have caused two or three properties to be prospected.

An expenditure of \$300,000 for the purchase of the Independence mine in the Wood River district, Idaho, and \$200,000 more for its development hinges on the close of negotiations by the Federal Mining & Smelting Co. with the owners. An option signed at Denver recently gives the Federal a right to take possession on November 15. In the meantime all the ore that can be broken will be shipped by the owners. The agreement must be ratified by officials of the Federal company and confirmed by stockholders of the Independence company. The owners of the Independence are Mrs. H. J. Allen of Hailey, and Dr. Harper of Chicago, who own three-fifths, and Charles F. C. Rutan of New York and others, who own two-fifths.

The Caledonia Mining Co., in the Coeur d'Alene, has declared its regular monthly dividend of \$78,150, disbursement to be made on October 5. This payment will be at the regular rate of 3c. per share. It will bring the total of payments to \$2,678,941, of which \$781,500 will have been paid this year. The directors of the Standard Silver-Lead Mining Co. have declared the regular quarterly dividend of \$100,000, payable on October 15. This disbursement will be the third of \$100,000 made this year at the rate of 5% quarterly on the capitalization of \$2,000,000. The forthcoming disbursement will bring the total to \$2,700,000, or \$700,000 more than the par value of the issue.

## HOUGHTON, MICHIGAN

HANCOCK CONSOLIDATED.—CALUMET & HECLA.

Operations at the Wyandot continue to be encouraging. The lode is 30 ft. wide, strong, and persistent. Another mill-test will be made when the bins are filled.—Production from the Hancock Consolidated for September will be 250,000 lb. Electric tramping on the lower levels of No. 7 Quincy opens up some of the richest rock this mine can handle. It may be necessary to put an auxiliary shaft down to mine some 600 acres of particularly good lode. In No. 2 shaft the openings are getting into more settled ground, having passed through the disturbed conditions of the Pewabic.—The Wolverine property is recovering 67% of refined copper from its mineral and averaging under 17 lb. per ton. Hardly any waste-rock is hoisted to surface. Last year the total linear feet of sinking, driving, and raising was 1924. While total costs last year were 12c. per pound, that figure has been increased 40% since.—Development on the Butler lode at the Lake mine are so encouraging that a separate shaft will be sunk. In the main shaft the openings all are in good ore.

A careful survey of the Michigan copper district indicates that no mines will be shut-down because of the Government price for copper. The majority of the mines here will be operated to their full capacity. There is a shortage of labor and not much hope of any substantial increase excepting such as comes in the fall and winter after the completion of farm work. Costs will be higher this year than ever before in the history of Lake Superior mining, in spite of the fact that there is no unnecessary construction. The Calumet & Hecla, for itself and subsidiaries, is making extensive improvements, particularly at Lake Linden. The Mutual plant at Tamarack city is one notable instance of improvement for subsidiaries. So, also, is the new coal-dock with its modern equipment. Quincy and Isle Royale are completing a number of new homes. The Copper Range and the Mass companies did some sensible and practical work along this line early in the year.

Lake Superior copper output is likely to be 30,000,000 lb. less than last year.

## TORONTO, ONTARIO

McINTYRE REPORT.—SCHUMACHER RESUMES WORK.—INCREASED ACTIVITY AT HOLLINGER AND KIRKLAND LAKE MINES.—HEAVY SILVER SHIPMENTS FROM COBALT.

Remarkable progress is shown in the McIntyre, at Porcupine, by the report covering a period of 15 months, ended June 30. Despite labor shortage and increased mining cost, ore to the value of \$1,954,793 was treated at a profit of \$725,790. The mining cost per ton was \$2.99 and the milling cost 88c. The most important feature is the increased value of

be working close to capacity. Reports conflict as to the results of the development work in progress, some big figures being current as to the additions to the ore-reserve. At the McEaney, formerly known as the Hollinger Reserve, a good grade of ore has been cut in the winze sunk from the 200 to the 500-ft. level. The ore above the 300-ft. level shows a gold-content of \$13 per ton. A mill will shortly be built with a capacity of 75 tons. The Coniagas, at Cobalt, has exercised its option on the Maidens-MacDonald mine, which will be worked in connection with the Anchorite. A mill is being built on the Premier Langmuir barite-silver property, about 15 miles south-

MAP OF ONTARIO AND THE GREAT LAKES

the ore-reserve. The estimated value of this on June 30 was \$4,943,000, as compared with \$2,247,000 on March 31, 1916. During August the ore milled made a new high record, being 15,410 tons averaging \$9.52 per ton, with a production of \$141,394. The Schumacher resumed operations last month. Approximately 3400 tons of ore was treated during the month ended September 15 with a recovery of \$23,000. Most of the new milling equipment is now in place and the complete plant is expected to be in operation by the end of October. It will have a capacity of 200 tons per day. The Dome is operating at great disadvantage on account of labor shortage, the mine force having been reduced to 200 men. The underground equipment has been improved; now it has a capacity of nearly 4000 tons per day, double that of the mill. The Hollinger Consolidated shows increased activity, and the mill is stated to

east of Porcupine, which is expected to be in operation by the end of the year. It will produce about 30 tons of barite per day. A shaft is down 100 ft., and some driving has been done. Considerable native silver, which will be recovered as a by-product, occurs along the walls of the vein.

The Tough Oakes, at Kirkland Lake, has 126 men on its payroll, and during August the mill treated 3400 tons of ore. At the Lake Shore the foundations for a mill are being set; as the machinery is on the ground, it should be completed in about a month. Development is in progress at a depth of 400 ft. A company under the title of the Ontario Kirkland is being organized with \$1,500,000 capital to operate the Hurd mine, on which five promising veins have been opened. The Orr claims are being developed by the Kirkland Porphyry, a newly formed company. A shaft is being sunk and free gold

is showing.—The Lucky Cross at Swastika is being wound up. The property has been taken over by the principal bondholders, who will form a new company.

Heavy shipments of ore are being made from Cobalt, where the improved silver market has led to the opening up of properties that formerly were unprofitable. Among these are the Silver Queen, containing a large body of low-grade ore, the Provincial, and the National. On the last of these a flotation-plant is treating 100 tons daily. Underground work will be resumed. The Kerr Lake, during the year ended August 31, produced 2,586,532 oz. silver, being the highest yearly production in its history. The net profit is estimated at \$1,166,358. At the Peterson Lake the plant lately in operation on the Susquehanna lease has been removed to the Gould lease, where the 200-ft. shaft has been unwatered preparatory to resuming work. The shareholders of the Ophir have authorized the increase of the capital from \$1,000,000 to \$1,500,000, which will enable development to be continued for at least a year.

There is renewed activity in prospecting in the Portage Bay and Maple Mountains silver district, where some good surface showings are reported. It is hoped that the high price of silver will induce speculators to furnish the capital necessary for the investigation of many promising claims in these areas.

### MANHATTAN, NEVADA

#### EXTENSIVE DEVELOPMENT AT WHITE CAPS AND UNION AMALGAMATED

The most important work in the White Caps has been the driving of the south cross-cut from the 500-ft. level to catch the downward extension of the east orebody. During the past week the work has been in limestone. Assays from the face have run as high as \$12.20 in gold. A slight turn has been made in the direction of the cross-cut, to carry it deeper into the limestone. There has been some surprise that the east orebody has not been already exploited from the bottom level, but a glance at the map of the underground workings will show that the edge of the orebody, if continuing from the fourth level downward at the same pitch and dip, would be several feet from the face of the south cross-cut, and the heart of the ore would be at least 40 ft. away. The hanging-wall cross-cut on the third level has been extended 24 ft., and now is out a distance of 58 ft.; the 310 raise has been put up 15 ft.; the cross-cut has been extended 18 ft. from the fourth level. The south cross-cut on the fifth level is in 257 ft. The footage for the week was 137. The daily tonnage for the mill is still about 100, but the grade is being raised. A large trommel has been erected below the rolls and a closed circuit formed, so that all the products reaching the roaster pass through a 6-mesh screen. The new Case oil-burners that are being tested in the roaster have given satisfaction. The entire roaster will be equipped with these burners.

In the Manhattan Consolidated mine rapid work has been made at the fourth station and the station-timbers are all in place. A cross-cut south has been started from the third level to develop the downward extension of the orebodies, proved to the south and west. The most important orebodies are known locally as the Mushett vein and the Kendall vein. From the fourth level a drift east has been started to expose the orebody, already well developed at the 200 and 300-ft. levels. An underground survey shows that the downward extension of the east orebody should be reached 250 ft. from the shaft.

The operations in the Union Amalgamated for the week are as follows: from the 600-ft. level the north cross-cut on fissure advanced 12 ft.; the east drift from No. 7 north cross-cut east 25 ft. Owing to the distance of the work from the shaft and also to atmospheric conditions, recent work has been considerably retarded by gas. A blower is now being installed, and as soon as this is in operation development work will

show a marked increase. The face of the north cross-cut on the fissure is now in low-grade quartz and should shortly cut the north orebody. The east drift has exposed a mill-grade of ore, the shoot being 80 ft. long and No. 11 north cross-cut has been started to prove the extent of the ore toward the foot-wall of the vein. No. 9 south cross-cut east has cut the hanging wall of the Swanson orebody and some rich ore has been developed, though the orebody is broken up at the point where struck. Owing to the fact that the recent work has exposed so many faces of mill-ore, it has been necessary to relieve the congestion of the mine-bins and during the week the mill-bins have been filled with this ore.

The joint operating shaft of the Extension and Zanzibar companies has now reached a depth of 130 ft. During the week 21 ft. has been added to its depth, entirely in limestone.

### MAYER, ARIZONA

#### BIG LEDGE.—COPPER QUEEN.—ARIZONA BINGHAMPTON.

The Big Ledge Copper Co. announces that construction work is to be resumed by October 1 at the smelter. The second furnace will have a capacity of 400 tons, and the total furnace capacity for the two furnaces will be 600 tons per day. A third furnace, two converters, and one reverberatory are also to be installed at a later date. Three shifts are to be put on two of the company's mines, the Butternut and the Henrietta. On the 200-ft. level of the Butternut, the orebody is said to be 50 ft. wide. The company plans the erection of a flotation-mill at the mine. A wire-rope tram has been purchased for the Butternut mine. The orebodies in the Henrietta are not as large as in the Butternut but are higher grade. The company has increased its capital stock to \$15,000,000 and on September 27 will complete the purchase or consolidation with the Great Western Smelter Co. The policy of the company will be to encourage the small mine-owners by providing a market for their ores.

The Copper Queen Co. is developing more ore in the lower workings of the mine. Claude Ferguson, mine superintendent, has outlined the system of development. The two deepest shafts have been unwatered and extensive old workings are being thoroughly sampled. The shaft at adit No. 2 is to be sunk 200 ft. deeper. It is estimated that 25,000 tons of mill-ore has been blocked out.

The Arizona Binghamton Co. has purchased a diamond-drill equipment and will prospect the lower workings with cross-holes before running mine cross-cuts. The second unit at the flotation-mill has brought the capacity to 250 tons. The high-grade ore that was being sent to the Humboldt smelter is now being run through the mill with the lower grade and satisfactory results have been obtained.

The district is active, especially in the vicinity of Copper mountain. There is a demand for silver properties.

### MEXICO

#### AMERICAN SMELTING & REFINING CO.

According to C. L. Baker, general manager, there is no immediate prospect of the smelter of the A. S. & R. Co. at Chihuahua being re-started. Mr. Baker said: "A little construction work is being done at Chihuahua, but it is not with a view to the re-opening of the smelter, and the idea circulated that Mexican officials have offered the protection of General Francisco Murguia's forces is all poppycock. The only reason the smelter is not being run is lack of coke. No Mexican officials have approached me with the suggestion that the Mexicans take over the smelters and reduction works is not to be considered. I have no statement to make concerning the smelter situation. The work of the American Smelting & Refining Co. will continue as before. We have three smelters operating at Monterrey, Matehuala, and Aguas Calientes."

## ALASKA

(Special Correspondence.)—The Rainy Hollow lode properties and the Porcupine gold placer properties that are being operated by Col. W. L. Stevenson, under option, are doing well. Ore taken out of Rainy Hollow is said to assay \$260 per ton, mostly in silver, although the copper value is about \$60. The hydraulic plant on the Porcupine river is said to be producing about \$1000 per day. The Rainy Hollow properties were optioned from a dozen claimants on condition of development,

The War Eagle mine on the Kuskulana river, owned by the Chitina Kuskulana Copper Co., is being developed by driving two adits, one on the west end of the War Eagle and one on the east end of the Calcite claim. The working force is about 45 men. The plant consists of a 120-hp. boiler, a 100-hp. engine, a 65-kw. generator, and an air-compressor. The ore is chalcophyrite. The company intends to build a spur railroad from the main line, a distance of about eight miles.—The Alaska Copper Co., operating on Nugget creek near the Kuskulana river, is one of the high-grade properties of Alaska.

The company has at present a working force of 100 men. Howard W. DuBois is consulting engineer. An auto-truck road is being built from Strelina to the mine, a distance of 18 miles, and the company expects to ship ore soon. The machinery consists of two combustion tandem engines, and a compressor with a capacity of about 500 cu. ft. free air per minute.—The North Midas copper and gold mine is employing 20 men and is operating in the east adit on a vein of high-grade ore. The machinery consists of a semi-Diesel combustion tandem engine, and compressor. The company expects to be shipping ore this year.—The Great Northern Development Co., at Copper Mountain, on the Kuskulana river, has completed 8000 ft. of development work, opening up a large low-grade property. E. F. Gray is general manager. He expects to install a 5000-ton flotation plant, work to commence in 1918. There are 165 claims in this property and a majority of the patents have been

MAP OF ALASKA

and this has been in progress all summer. The Porcupine placer was secured on option from the Porcupine Mining Co., a corporation organized by Col. Horvey Conrad several years ago. Martin Nolan, representing Col. Stevenson, is in charge.—The Kennecott mine is now employing 450 men.—The Mother Lode mine has produced about \$5,000,000 worth of ore this year. At present the company is erecting a steam-electric plant at the mouth of McCarthy creek, and is building an auto-truck road up the creek 14 miles to the lower terminal of the tramway. They are also building a 250-ton mill. The present production of the Mother Lode is about 250 tons per day, and the working force is about 200 men.—Pat Bonner has a bond on the Erickson property, which shipped two carloads of high-grade copper ore to the Tacoma smelter this spring. Mr. Bonner expects to build an auto-truck road from McCarthy to the mine. The mine is 36 miles south-east of McCarthy creek on the Nizina river. There are several hydraulic gold mines in the Nizina district that are working crews of from 10 to 150 men. The principal operators are Frank Kernan, George Max Esterly, and Howard Birch.

issued.—The Big Horn mine, on Big Horn mountain, owned by L. C. Dillman, is being developed by an adit driven on the ore. T. W. Lynch is in charge of the property.—The Climax mine, owned by London & Cape Co., is being developed by two adits. This property consists of 14 claims and was the second property to be patented in the Copper River district. The ore outcrop is 40 ft. wide and runs from 3 to 8% copper. The property joins the east end of the War Eagle.—Hubbard & Elliott Co., on Elliott creek, has a property being developed by a long cross-cut.

Treadwell, September 16.

(Special Correspondence.)—The Alaska Agricultural Industrial Fair held here September 3, 4, and 5 was a decided success, and hereafter will be held annually. The Willow Creek mining district was well represented in the mining section. One of the most interesting exhibits was a quantity of bornite brought from the Kashwitna district by four prospectors, William Trout, Dolf Smith, Anton Stander, and Fred Kelly. Besides bornite the ore contains quartz showing gold in leaf and wire form. The vein is said to be in granite. A

number of prospectors have left for the scene of the discovery. —An expedition carrying 10 men has left here for Snug Harbor to investigate an alleged mineral discovery. —There is a strong possibility that owing to increased cost of materials and abnormal conditions generated by the War the Government will suspend operations on the main line of railroad, but the branch line to the Chicaloon coalfields is nearing completion and will be finished shortly.

Anchorage, September 11.

## ARIZONA

(Special Correspondence.)—Of the eleven large smelters in the State, seven are now operating at full capacity, one is reaching full capacity rapidly, while three are idle.

E. L. Jones, Jr., of the U. S. Geological Survey, has been investigating manganese deposits of the State during the past month.

More than 1800 men have come to Bisbee since the beginning of August.

The Oatman mines produced \$228,000 during August, the best return for a single month to date.

Oatman, September 29.

## COCHISE COUNTY

(Special Correspondence.)—It is announced by Col. T. N. Seger, president of the Golden Reef Mines Co., that fresh exploration is to be undertaken. Samples taken over a distance of 800 ft. on 1000 ft. of outcrop give an average assay of \$9.92 per ton. —Owing to the advance in the price of silver, shipments of ore from the Tombstone district are increasing. Considerable manganese ore is also being mined and shipped. —A rich strike of silver ore is reported in virgin ground at the Commonwealth mine, which has been idle for some months. —The Central Butte Mining Co., of which A. H. Struthers, of Douglas, is manager, is making an excellent showing and is expected to begin production soon. At the Middlemarch mine, seven miles from Pearce, 40 men are now employed; ore is being hauled to Pearce by motor-truck.

Tombstone, September 20.

## GILA COUNTY

(Special Correspondence.)—The International smelter is now working at full capacity and handling all the concentrate from Miami and Inspiration. Miners are returning to work daily, and in 30 days the mines will be working full shift. —W. W. Reese, principal owner of the Columbia mine, at Grass Valley, California, accompanied by engineers, has been looking over the Greater Miami property with view to purchase.

Globe, September 22.

## MARICOPA COUNTY

(Special Correspondence.)—The Blue Ridge prospect, at Wickenburg, owned by John Grace, has been sold to Fraser & Ridgley. The Blue Ridge adjoins the Monte Cristo mine.

Phoenix, September 20.

## MOHAVE COUNTY

(Special Correspondence.)—The new Steffy mill has commenced to treat 3000 tons of Altata ore, supposed to average \$11 in gold, silver, copper, and lead. —An important strike of ore has been made in the Emerson tunnel of the Chloride district. This tunnel is now in 406 ft., and 150 ft. below the surface it opened up good ore for its entire length. —Operations have been resumed at the Merrimac mine. A compressor and engine have been ordered, and a contract calling for 300 ft. of sinking and cross-cutting will be let in a few days. The firm of Sill & Sill, engineers and ore-testers, have taken samples for treatment. —Fred W. Sherman, general manager of the Keystone mine, expects to have the re-constructed mill

operating within a few days. New machinery has been added to the plant. It is intended to treat the dump ore for several months and in the meantime the mine will be unwatered. Prior to the closing of this mine from 70 to 80 men were employed. —Two Oatman companies, the Gold Road Bonanza and the Oatman United, are calling meetings of their shareholders to change the articles of incorporation so that the stock can be made assessable. It is hoped that the extra money raised in this way will enable the companies to complete their development. —Work is expected to be started soon on a tunnel to open up the Diamond Joe mine. —The shaft of the Leviathan mine is now down to the 200-ft. level and is in ore 5 ft. wide averaging 5% molybdenum. It is the intention to sink this shaft to 250 ft. and cross-cut a parallel vein. The Arizona Moss Back Co. has been organized to develop and work the old Moss Back mine, which was last worked in 1901. The present 330-ft. shaft will be sunk to 530 ft. The property became idle on account of litigation, but in the spring the mine was unwatered and examined, resulting in the formation of the new company. There is ample water one mile north of the property for mining and milling.

Kingman, September 18.

A large body of molybdenite ore, assaying from 5 to 12% MoS<sub>2</sub>, has been struck in the Jackman mine, Hualpai mountains. The property is under option to the Willys Automobile Company.

## PIMA COUNTY

(Special Correspondence.)—The control of the Daily Arizona Consolidated Copper Co. has been acquired from W. H. and John Daily by W. H. Martin and associates, of Indiana. The company is to be re-organized and \$100,000 spent in development. Machinery is on the ground. The ore mined during development, which is expected to be 50 to 100 tons per day, will be shipped. Diamond-drilling is being continued on the Little Ajo. About a mile west, on the property of the Arizona Mines Co., which adjoins the New Cornelia, diamond-drilling is also being carried on. On the latter property are good showings of ore, some of which has been shipped. The New Cornelia company has increased its copper output this month.

Tucson, September 21.

## PINAL COUNTY

(Special Correspondence.)—It is reported that the shares of the Silver King Extension, from which several hundred thousand dollars was taken out in the early days, are in demand because this property adjoins the Fortuna mine, in which the recent strike has been made. Development work has commenced in the Camelback mine. A contract has been let for the first 100 ft. of adit to intersect a lode in which a shaft has been sunk to a depth of 40 ft. The company owns 12 claims. Ore in good quantities has been shipped, running 270 oz. in silver and \$26 in gold. At a recent meeting of the Arizona Ray Copper Co. the name was changed to the New Arizona Ray Copper Co., and the capital increased from one to five millions. It is proposed to sell 100,000 shares at 75 cents for further development, which will include drilling and sinking.

Florence, September 21.

## YAVAPAI COUNTY

(Special Correspondence.)—F. P. Taylor is in Prescott for the purpose of opening the Comanche mine, in the Weaver district near the Hassayampa river. This property was forfeited by Mr. Taylor while on military duty at Fort Whipple. Development work will be commenced early in the fall. Assays made for Mr. Taylor 35 years ago ran from 60 to 300 oz. in silver. —It is reported by E. H. Oldham, of the Yeage Copper Co., that an excellent showing of manganese ore has been found on the company's property in Yeage canyon. Sinking

was started until 35 ft. was reached, when water stopped the work. Samples show 40% manganese.

Prescott, September 21.

(Special Correspondence.)—A remarkable body of copper ore is being opened into by the Big Ledge Copper Co., at the Butternut mine, two miles north-west of here. At a depth of 300 ft. the vein is 48 ft. wide; the average value being 4% copper. On the 425-ft. level a cross-cut is being run, and so far 15 ft. of the vein has been traversed, the copper-content increasing to 10%. The finding of this ore in such a large body settles the question of tonnage for the company's smelter here; it is now to be rushed to completion. Dwight L. Woodbridge, the consulting engineer of the company, is due from Duluth. Plans are made for a large flotation-mill at the Butternut mine to treat the ore that has already been developed in the upper workings.

The Blue Bell mine, owned by the Consolidated Arizona Copper Co., is stopping 40 ft. of ore on the 1000-ft. level, and the Arizona Binghamton and Copper Queen companies are working on orebodies that will average 15 ft. in width above the 400. These mines are not contiguous, but they have much the same character of ore, principally chalcopryite with some chalcocite on the lower levels.

Driving will begin in a few days on the new 1200-ft. level in the Blue Bell mine. The shaft has been sunk 200 ft. deeper from the 1000-ft. level. It is expected that the orebodies that are now furnishing 300 tons daily for the Humboldt smelter will be cut at this new level. Chalcocite has been coming into the ore at the 1000-ft. level recently, giving reason to believe that a higher grade of ore will be found on the 1200 level.

Mayer, September 28.

## CALIFORNIA

### DEL NORTE COUNTY

(Special Correspondence.)—Manganese claims have been located in the Shelley Creek district by G. W. Gravlin of Grants Pass, Oregon. Some high-grade copper ore is being taken out at the Old Crow copper mine. E. A. McPherson is manager.

Crescent City, September 24.

### EL DORADO COUNTY

Owing to the increase in the price of silver, the once famous camp of Calico is beginning to show renewed activity. A new cyanide plant is treating 400 tons of tailing per month. It is estimated that there is 200,000,000 tons of tailing on the old dumps. A number of mining men have visited the locality and it is probable that other plants will be erected.

### SHASTA COUNTY

(Special Correspondence.)—The Noble Electric Steel Co. has arranged to operate a second furnace on manganese ore, which will bring the output of ferro-manganese to 400 tons per month. The company is turning out an 80% product and for the present will confine its attention to the manufacture of this material. Shipments of manganese are being received from several points. Recent developments in properties in the vicinity of Greenville and Indian Falls, Plumas county, have proved encouraging.

The Pittsburg-Mt. Shasta Co. is operating the 15-stamp mill at the Little Nellie mine on gold ore, and shipping copper-bearing ore to the Kennett smelter. The latter ore is drawn from the lower levels, and diamond-drills indicate wide bodies of copper ore to an average depth of 800 ft. The property lies near the Mountain Copper mine.

The Craig Mining Co. has arranged to prospect placer deposits near Igo with diamond-drills. William McKee is in charge. The gravel channels have been worked in the past with indifferent results, although rich ground has been found. With a modern dredge it is believed much of the ground can be mined profitably.

The East Side belt continues to show growing activity. The Afterthought Copper Co. is treating 300 tons of ore daily at its flotation plant and expanding its work in the mine.—The Bully Hill group is undergoing aggressive development and shipping to the Kennett smelter.—The Arps group continues to develop well.—Ore conditions in the Shasta-Belmont have improved to a point where early shipments are expected. Several small properties are being worked vigorously and two important deals are reported pending.

Kennett, September 30.

### SIERRA COUNTY

(Special Correspondence.)—Under the management of D. E. Hayden, the Wisconsin Mining Co. is installing an electric hoisting and pumping plant. Underground work has been discontinued pending completion of surface improvements. The company has developed some excellent ground, and the outlook is considered satisfactory.

At the adjoining North Fork mine the main incline and drift have been re-timbered and development has been resumed. North and south cross-cuts will be driven to determine the length of the ore-shoot recently uncovered, from which rich ore is being mined. Prospecting for a second shoot has begun. George F. Stone is superintendent. The mine is near Forest.

With two shifts the main adit of the City of Six group is advancing rapidly toward the lode. It is at present in 350 ft., with the vein showing harder rock and better defined walls. A cross-cut has been started to seek the hanging wall, and other cross-cuts will be driven. This mine is near Downieville.

The Twenty-One Co. has erected a bunkhouse capable of housing 50 men, a boarding-house, and other structures at its property near Alleghany, and has begun building a blacksmith-shop and several cottages. Considerable new work has started. Thirty men are on the payroll.

Downieville, September 30.

### SISKIYOU COUNTY

(Special Correspondence.)—The Dewey gold mine, nine miles west of Gazelle, resumed operations this summer, after being closed for ten years. It is equipped with a 10-stamp mill, run by electricity. The vein is from 10 to 20 ft. wide and is opened by a 900-ft. drift. The new improvements include nine miles of power-line. G. C. Smith, of Los Angeles, is superintendent.—The Jillison gold mine near Hornbrook has closed-down until next spring.—The Siskiyou Dredging Co. is operating successfully on Greenhorn creek.—The Woods & Brown company is developing the Sunset group of copper claims near Slater Butte on Cade mountain.

Hornbrook, September 27.

## COLORADO

The Platon Rey Leasing Co., which leased the Margin & Silver King claims, shipped a car of high-grade silver over this week. This is the first shipment, but the dead-work being completed, regular shipments may be expected henceforth.

A large body of manganese ore, assaying 35 to 40% Mn, has been discovered in the old Bohn mine at Leadville. The ore-body was struck on the 400-ft. level, and a level has been driven 40 ft. in solid ore and a raise put up 12 ft. without reaching the limits of the deposit.

### BOULDER COUNTY

(Special Correspondence.)—The plant of the Mojave-Boulder Tungsten Co. is completed and in operation. This company acquired the Bracken group, and has been developing it actively. The April Fool and Good Friday give promise of becoming good properties. H. Brower, the superintendent, estimates that with the force now employed, he can produce 20 tons daily for many years.

The Slides, an old mine of the early days near Boulder, has a dump that is being worked over by the Gold Hill Concentrating Co., namely, George Teal, Charles Gustafson, Robert Kimoch, and Clifton Barr. The ore is being treated by the flotation process with satisfactory results.

A strike has been made in the Boulder Falls section on the Catastrophe mine, belonging to Henry Lawrence of Boulder. The vein ranges from 10 to 2 ft. in width and averages over 40%. A ton of tungsten is produced daily. This is considered to be one of the best strikes of the season. Maurice Beckman, a mining man, has moved from Clear Creek county to Boulder and is now operating a lease on the Yellow Pine mine. The Evans group near Summerville, consisting of eight patented claims, are being cleaned out and re-timbered. On Gold Hill, George Kirkbridge has a group of 10 patented claims. He has leased the Cash, St. Joe, and three others to Denver parties. Active operations are in progress. The Myrtle mine belonging to D. S. Clark on Gold Hill has been leased to Jim Gouyde and Oscar Wallon. Regular shipments of gold ore are being made. W. F. Murphy, from Iowa City, Iowa, is building a mill on the Little Johnny mine at Salina. He has a new process. The old Victoria mine at Summerville, with a big silver-producing record, has been modernized in equipment and is maintaining a steady output. Frank M. Pickard is superintendent. The Hudson mill in the same district has added a Dorr agitator and another flotation unit. The Huron people at Eldora are getting out some good gold ore. The Consolidated Leasing Co. is getting material hauled for the new mill. C. E. Dewitt, superintendent of the Wolf-Tongue Tungsten mill, reports everything running to fullest capacity. Eldora, September 22.

## NEVADA

### EUREKA COUNTY

(Special Correspondence.)—At the Marne mine, Harris and Finn have completed sinking their shaft to the 150-ft. level and are making their first shipment from that place. The Eureka Croesus shipped nine cars this week from the new strike on the 400-ft. level which is reported to run about \$60 per ton.—Work has been commenced by J. H. Rogers as manager for a new company on Mineral hill immediately south of the Richmond property to try to discover the fault that is supposed to have enriched the orebodies on Ruby hill now owned by the Richmond Eureka Mining Co., a subsidiary of the United States Smelting Co.—C. F. Wittenburgh of Tonopah came in a few days ago and made arrangements to commence work on the Cyanide mine on Adams hill. Two outfits in the Philipsburg district, about 18 miles north-east of Eureka, have about three carloads of ore out but are held up owing to lack of teams. Several shippers have been notified by the smelters to curtail shipments on account of congestion of ores at the smelters, scarcity of labor, and coal for smelting. Four trucks and a trailer are hauling ore to this place for shipment from Hamilton in the White Pine district, about 30 miles east, making about two trips in three days, averaging five tons per load.

Eureka, September 24.

### HUMBOLDT COUNTY

(Special Correspondence.)—An exploratory drift from the 900-ft. level of the Rochester mine last week cut an orebody 40 ft. wide. The vein has since been tapped by ten more cross-cuts and shows high-grade ore. The discovery, which is beyond the old foot-wall, opens interesting possibilities in an entirely new section of the property. On the 800-ft. level the Adams vein has widened so that it has been found necessary to maintain a central pillar of ore to support the roof. The main stope is 20 ft. wide and is in solid ore. The winze from the 900-ft. level is progressing in ore assaying \$17 silver and \$4 gold, with better ore as the foot-wall is approached. The

mill is treating 211 tons daily, averaging about \$13 per ton. A shipment of bullion valued at \$31,300 was made on September 21.

With the exception of motors for the tubes and ball-mills, and trolley-locomotives, all equipment for the 300-ton mill of the Rochester Combined is either on the ground or has been shipped. Sinking of the Happy Jack shaft has advanced to the 200-ft. level, where a station has been cut, and north and south drifts started. Excellent ore is developing in the north drift and west cross-cuts on the 100-ft. level. New work has been begun from the Kromer and Shepherd adits, with encouraging results.

The orebody lately intersected in the La Toska mine, at

MAP OF PART OF NEVADA

Wright's canyon in the Humboldt range, is yielding ore running high in silver and a little gold. It was intersected about 3000 ft. from the adit-portal, after a search of six years. The lode is six feet wide and lies between walls of limestone and rhyolite.

Humboldt now stands second among the counties of Nevada in point of productive mines, and is steadily increasing its yield of gold, silver, copper, and lead. Prospecting is active, and the general outlook is encouraging.

Rochester, October 1.

### NYE COUNTY

(Special Correspondence.)—In the Silver Top shaft of the Tonopah Mining Co. 136 ft. of development was performed and 15 ft. in the Mizpah shaft. Re-timbering of the Sandgrass is completed and stoping has been resumed. The raise driven on the Mizpah vein, showing a 4-ft. face of mill-ore, has developed considerable tonnage. The production for the week was 2400 tons. The Tonopah Extension shipped 20 bars of bullion, valued at \$46,000, which represents the bi-weekly clean-up. Development in the No. 2 shaft amounted to 124 ft. The Murray vein on the 1260-ft. level is 8 ft. wide. The Victor was developed 119 ft. On the 1440-ft. level 613 raise is being driven in 6 ft. of mill-ore, while 1503 raise on the 1540-ft. level is in 3 ft. of ore. The south cross-cut on the 1680-ft. level was driven 61 ft. during the week. The production was 2380 tons.

The Tonopah Belmont has announced the purchase of the Alta, St. Louis, and Palmyra mines, near Telluride, Colorado. The large tonnage of complex ore will be treated by the Jones-Belmont flotation process. Raise 44 from the 900-ft. level has found some ore, while raise 90 on the 1100-ft. level has developed an orebody on the Rescue vein. On the 1166-ft. level the Mizpah fault-vein has been intersected  $4\frac{1}{2}$  ft. wide. The plant at Millers shipped 21 bars of bullion valued at \$43,908, while the Belmont mill shipped 58 bars of bullion valued at \$122,650, and 31 tons of concentrate valued at \$12,000. In August 10,790 tons of ore was milled for a net profit of \$121,695. All the stored silver of the Belmont company has been sold. The production last week was 2445 tons.

The West End Con. Mining Co. produced 905 tons from the West End and Ohio shafts. Sampling in the West End has developed a large tonnage of low-grade ore that can be exploited if the price of silver is sustained. At the Ohio, 512 cross-cut has reached the foot-wall of the vein. Owing to the high price of silver the McNamara Mining Co. has been able to resume operations after a shut-down of three years. The underground workings were found to be in excellent condition, so stoping was commenced immediately. A crew of about 20 men has been added. A few minor repairs have been made in the mill, which will commence operation on September 28. Development is contemplated in addition to the regular stoping.

The Jim Butler Tonopah Mining Co. produced 3403 tons of ore in August, realizing a profit of \$46,740. The production last week was 750 tons. The Buckeye Belmont has commenced development on the Buckeye-Eagle vein. The Rescue-Eula produced 171 tons of ore, the Montana 71 tons, the North Star 54 tons, the Midway 94 tons, the Cash Boy 40 tons, and miscellaneous 58 tons, making the week's production at Tonopah 9388 tons with a gross value of \$164,290.

Tonopah, September 26.

## NEW MEXICO

(Special Correspondence.)—The Gold Eagle group has resumed operations and will start milling shortly.—The recent strike on the 300-ft. level of the Johnson mine is developing well. The Socorro Mining & Milling Co. operates this property and is arranging to increase shipments to the mill.—During the week the Mogollon Mines Co. has opened up a quantity of good ore in the upper workings that had been overlooked by former operators.—The Oaks Co. is shipping from each of its properties, namely, the Maud S., Deep Down, Eberle, and Clifton.

Mogollon, September 25.

## Obituary

JAMES F. BURNS died at his home in Colorado Springs on September 22 at the age of 64. He was one of the locators of the Portland mine at Cripple Creek. He was associated with W. S. Stratton and James Doyle in the development of the mine, making a large fortune. From 1895 to 1905 he was president of the Portland Gold Mining Company.

E. M. DE LA VERGNE, a pioneer of Cripple Creek, formerly general manager of the Elkton Consolidated, superintendent of the United Gold Mines, and locator of the El Dorado claim, the first recorded location in the district, died at his home in Colorado Springs, on September 18, at the age of 71 years. De La Vergne was superintendent for five years of the Old Man mine at Camp Fleming, and the Black Hawk mine at Silver City, N. M. Returning to Colorado he managed the Orient mines at Lawson, and the first assay-certificate signed by Professor Lamb of Colorado College in December 1890 is believed to have been the first authoritative record of gold in the Cripple Creek district.

# PERSONAL

*Note: The Editor invites members of the profession to send particulars of their work and appointments. This information is interesting to our readers.*

J. B. TYRRELL has been to Newfoundland.

BENJAMIN REZAS, of Mexico City, is here.

A. A. ARLUCK has been drafted into the National Army.

BLAMEY STEVENS has left Mexico and is now at Brooklyn.

H. VINCENT WALLACE has returned to Los Angeles from New York.

DRUMMOND MACGAVIN has arrived in England on his way to France.

T. A. RICKARD has gone to St. Louis, to attend the meeting of the Institute.

FRANK W. ROYER, of Los Angeles, was in San Francisco during the week.

F. R. WOLFLE has gone from Spokane to the Florence mine at Ainsworth, B. C.

ROY STARBIRD, recently at the Perseverance mine, has returned from Alaska.

CHARLES W. MERRILL has gone to Washington to join the Food Administration.

F. S. KIRKLAND is consulting engineer at the Yankee John mine in Shasta county.

N. A. STOCKETT has enlisted in the 164th Depot Brigade at Camp Funston, Kansas.

M. M. JOHNSON is consulting engineer at the Silver King mine in Shasta county.

THOMAS NEILSON, metallurgist from Siberia, will sail for Manila on professional business.

IRVING A. PALMER has been appointed professor of metallurgy in the Colorado School of Mines.

F. M. LELAND, of New York, formerly manager of Balaklala mine at Kennett, is at Redding, California.

COURTENAY DE KALB has returned to San Francisco from a journey of observation in southern Arizona.

FLETCHER MCN. HAMILTON, State Mineralogist of California, is attending the Institute meeting at St. Louis.

L. E. PARKER, formerly of Montana, is general manager of the Silver King mine, near Redding, California.

HOMER HAMLIN has opened an office as consulting engineer and geologist at 1103 Central Bdg., Los Angeles.

G. P. WATSON, metallurgist at the Braden Copper Co., arrived in San Francisco last week on his way from Chile.

FREDERICK G. CLAPP, chief of the Petroleum Division of the Associated Geological Engineers, is in Kansas and Oklahoma.

CHARLES F. WILLIAMS, formerly with the Tonopah-Belmont company, has been commissioned Lieutenant in the Engineer Corps and is at Fort Leavenworth, Kansas.

A. C. BEATTY has offered his London house as a hospital for American officers under the supervision of the Columbia Hospital Unit.

P. K. LUCKE, formerly consulting mining engineer for the Cia. Minera de Penoles and Cia. de Minerales y Metales, has resigned, and will resume independent practice at 621 Bedell Bdg., San Antonio, Texas.

E. G. SNEDAKER and ANDREW NEWBERRY have been commissioned Lieutenants in the Engineer section of the Officers Reserve Corps and are now at Vancouver barracks, Washington.

THE ST. LOUIS MEETING of the American Institute of Mining Engineers opens on October 8. An excellent programme has been arranged, including visits to the zinc and lead districts of Missouri and the oil-fields of Oklahoma. A special session of the War Minerals Committee will be held.

# THE METAL MARKET

## METAL PRICES

San Francisco, October 2

Aluminum-dust (100-lb. lots), per pound.....	\$1.00
Aluminum-dust (ton lots), per pound.....	\$0.95
Antimony, cents per pound.....	17.00
Antimony (wholesale), cents per pound.....	14.75
Electrolytic copper, cents per pound.....	23.50
Pig-lead, cents per pound.....	8.25-9.25
Platinum, soft and hard metal, respectively, per ounce.....	\$105-111
Quicksilver, per flask of 75 lb.....	\$105
Spelter, cents per pound.....	10.50
Tin, cents per pound.....	61
Zinc-dust, cents per pound.....	20

## ORE PRICES

San Francisco, October 2

Antimony, 45% metal, per unit.....	\$1.10
Chromite, 40% and over, free SiO <sub>2</sub> limit 8%, f.o.b. California per unit, according to grade.....	\$0.80-0.75
Chromite prices show a tendency to remain stationary. With the advent of winter, when the haulage conditions are less favorable than at present, prices will be more erratic and are likely to go higher.	
Magnetite, crude, per ton.....	\$8.00-10.00
Manganese: The Eastern manganese market continues fairly strong with \$1 quoted on the basis of 48% material.	
Tungsten, 60% WO <sub>3</sub> , per unit.....	28.00
Molybdenite, per unit MoS <sub>2</sub> .....	\$40.00-45.00

## EASTERN METAL MARKET

(By wire from New York)

October 2.—Copper is inactive and nominal, remaining at Government price at 23.50c all week. Lead is dull and steady, remaining at 8c. all week. Zinc is quiet and easier at 8.50 to 8.37c. Platinum remains unchanged at \$105 for soft metal and \$111 for hard.

Copper producers express general approval of the plan to pool output of the country. It is stated on highest authority that prompt arrangements to this effect will be put in operation by the Government, regardless of possible appointment of a special board of administration. Smaller producers will share an apportionment of trade with all consumers, and on the other hand larger producers will share pro rata in whatever allotment is diverted to domestic consumption.

The owners of leading American copper share will receive in September in dividends an estimated total of \$27,232,000. This compares with disbursements in August of \$11,467,000 and of \$26,389,000 in September a year ago. In the first nine months of 1917 these copper companies will have paid to their stockholders the huge total of \$140,437,443, compared with \$107,681,058 in the same period of last year.

A canvass of the larger copper producers in New York discloses great uncertainty in the copper market, notwithstanding price-fixing by the Government for the next four months. Both producers and consumers are "up in the air," due to lack of details in connection with the carrying out of the proposed plans for handling the copper market, and this condition will continue until Washington furnishes more detailed advice as to what can be done and what should not be attempted under the new order of things.

Charles Hardy writes on September 23 from New York:

Tungsten has been exceedingly active during the past week and considerable business has been done. The tonnage turned over is heavy, yet some of the buyers would have bought more if the price-fixing for steel had not made them hesitate before committing themselves. As it appears now, the prices fixed for steel leave high-speed steel and tool-steel out of consideration and further business is now looked forward to in tungsten. Off-grade ore containing copper though high in tungstic acid which could not be sold a few days ago at \$21 was sold this morning at \$23, which would put the price for highest-grade wolframite at \$25 or better. The demand for tungsten has received further impetus by heavy inquiries on the part of the motor industry where aeroplanes and tractors are called for by the Government. Scheelite remains unchanged at \$25 basis 60% WO<sub>3</sub>. The molybdenite market continues firm at \$2.50 per pound on the basis of 90% MoS<sub>2</sub>. Lower-grade material has been sold in proportion.

Small business has been done in prompt antimony around 15½c per pound for November delivery. Prices remain for prompt around 15½c. The market continues practically lifeless.

The manganese market remains the same with \$1 still quoted on the basis of 48% material.

Consolidated Interstate Callahan Mining Co. has passed its dividend. In explanation, President Percival says: "The directors decided that the uncertain outlook, due to the War, and the increased cost of production, together with the necessity of providing for heavy war taxes, estimated under the provisions of the statute as now drawn at approximately \$300,000, which must be paid out of 1917 earnings, make it desirable for the company to create a strong reserve in order to be properly protected against any emergency."

# Eastern Metal Market

New York, September 26.

The entire metal market has a better aspect due to the fact that some important uncertainties that have been hanging over the market for so long and causing extreme unsettlement have at last been determined; at least a definite price for copper has been named by the Government, affording a basis for future negotiations, although the market for copper at present is at sea. Lead has also fallen to the Government price-level.

Copper is inactive and nominal.

Tin is firm and strong.

Lead is steadier and firm.

Zinc is quiet and fairly firm.

Antimony continues inactive.

Aluminum remains unchanged.

The long expected Government announcement of steel prices came on Monday and with unexpected suddenness. The steel world, excepting those on the inside of the negotiations, has not yet recovered, nor does it really know where it stands. Pig-iron has been fixed at \$33 per gross ton, but no grade of iron is mentioned, and they vary in prices. Coke has been fixed at \$6 per ton, but there are two kinds of coke. Steel bars are placed at \$2.90 per 100 lb., or \$58 per ton; structural shapes at \$3 per 100 lb., or \$60 per ton; and plates at \$3.25 per 100 lb., or \$65 per ton. Whether private business has to be done at these figures is still uncertain, and at the present writing the trade is 'up in the air' and at a standstill.

## COPPER

The sensation of the week has been the announcement by the Government of its price for copper, 23.50c. per lb. This appeared last Friday, September 21, and was reported as applying to both Government, foreign, and domestic business for a period of four months. Generally speaking the price is distinctly satisfactory, and is higher than many expected. It is deemed eminently fair and conducive to the maintenance of production at a high rate. There is no question that a good, and in some cases a high, profit can be made at the new price. This is the general opinion in the trade. So much for the price. The market, however, at present does not know just where it stands. There is no market quotation unless that of the Government be adopted; there is no business for producers, and dealers refuse to quote; there is considerable inquiry, but producers are generally saying that they have no copper to sell at the Government price at present, while the smaller dealer is not informed whether he may sell at a higher price than 23.50c. per lb. without getting into trouble. Many small wholesale dealers have high-priced copper that they sell in 5 and 10-ton lots. Until some definite information as to the exact status of both large producers and small dealers is forthcoming business is practically at a standstill. It is not known to what extent domestic business will be ruled by the Government price, as it is a fact that legally the Government cannot fix any prices except for its own needs. In the absence of any transactions for any purchases, our quotation is necessarily nominal at the Government price of 23.50c. For delivery in the first quarter 26c. is quoted by some, but consumers are uncertain what the condition as to price-fixing will be then, and consequently are not anxious to enter the market. The general feeling, however, while chaotic at this writing, is that the big problem will work out for the benefit of all concerned. It is recognized that the Government's main object is to cut out speculation.

## ZINC

The market has not changed greatly from the distinctly better tone reported last week. Demand is not large and has apparently eased off. In the last two weeks a fair business has been done at the prices already quoted. It has been well distributed, but not large in volume. For the most part it has been for fairly early delivery, business for the later positions being of small consequence. Producers and dealers are not inclined to commit themselves far ahead. Today the market is steady, but is a little easier, if anything, with quotations at 8.25c., St. Louis, or 8.50c., New York, for September and October delivery, with last quarter held about  $\frac{1}{2}$  to 1c. higher. Reports are to the effect that demand from the galvanizing and brass interests is not large. It is expected, however, that the latter phase of the trade will demand large amounts of zinc as the War progresses.

## TIN

The tin market is higher than a week ago when our last report was sent. This is due to several causes. The principal one is a report that an embargo in shipments from the East was to be put into effect in October. This has not been confirmed, but nevertheless it has a stiffening influence. Another factor is an advance in Atlantic war-risks due to a fear of submarine activity on this side. The fact that the London market has advanced decidedly has been a factor also. Straits tin advanced there to £3 5s. per ton for spot delivery with spot standard up to £3 and future standard up £2 15s. Yesterday spot Straits on this side was nominal at 62.50c., New York, but the market is nervous and inquiry is lacking. Tin arrivals have been 2235 tons so far this month, with 4500 tons afloat. No large volume of business is reported.

## LEAD

Unquestionably the lead market is gradually assuming a more stable aspect. The fact that the independent and Trust price are at the level at which the Government is obtaining its supplies is a stabilizing influence. There is more inquiry, and the market is steady. It is believed that the market quotation of 8c., New York, or 7.92c., St. Louis, can be and is being slightly shaded by some small interests, but, on the whole, what business is being done is mostly going at 8c., and it is likely that the bottom has been reached and that an upward swing is in prospect or certainly a firm and stable market at near the present level.

## ANTIMONY

The market continues in its dull and lifeless condition with quotations for Chinese and Japanese grades unchanged to 15 to 15.50c., New York, duty paid.

## ALUMINUM

No. 1 virgin metal, 98 to 99% pure, can still be obtained at last week's quotations of 41.50 to 42.50c. per lb., New York. The market is no stronger and demand is still of small volume.

## ORES

Tungsten: The market has been active with considerable business reported at the prevailing prices of \$23 to \$26 per unit. Ferro-tungsten is unchanged at \$2.30 to \$2.60 per lb. of contained tungsten.

Molybdenum and antimony: Firmness characterizes the molybdenum market at \$2.20 per lb. of MoS<sub>2</sub> in 90% material with lower grades in proportion. There is nothing to report in the antimony-ore market. Quotations are unchanged.

## Recent Decisions

### OIL LEASE—SOLD SUBJECT TO DELIVERY CONTRACT

Where one purchases an oil lease with knowledge that his vendor has contracted that the oil produced on the property shall be sold and delivered to a pipe-line company at a price named in the sale-contract, he is bound by such contract.

*Simms v. Southern Pipe Line Co. (Texas), 195 South-western, 283. May 17, 1917.*

### POLLUTION OF STREAMS FROM MINES

Where a State statute requires the draining of working places in mines into adjacent streams or water courses, the State cannot prosecute a mining company for pollution of a stream resulting from such drainage even though an indictment would lie at common law.

*Commonwealth v. Kingston Coal Co. (Kentucky), 194 South-western, 1038. May 25, 1917.*

### MINING CORPORATION—WHEN NOT DOMICILED

A New York corporation engaged in mining in Alaska is not "doing business" in Washington because it is maintaining an office there for buying supplies and forwarding them to Alaska, such as will enable a Washington court to obtain jurisdiction of it on a cause of action arising in Alaska, by service of the complaint and summons on such purchasing agent.

*Macario v. Alaska Gastineau Mining Co. (Washington), 165 Pacific, 72. May 19, 1917.*

### OIL LEASE—INJUNCTIVE RELIEF DENIED

An oil lessee who has drilled one "dry hole" but has not thereafter proceeded within the time set, with diligence and good faith, to drill other wells to develop the property will be denied injunctive relief to prevent the lessors from enforcing a forfeiture of his lease.

*Advance Oil Company v. Hunt (Indiana), 116 North-eastern, 340. May 29, 1917.*

### COAL LEASE—CASUALTY CLAUSE CONSTRUED

A coal-mine lease provision that minimum royalties need not be paid during strikes and other unavoidable casualties beyond the lessee's control while the mine is closed due to such casualties, includes shut-downs caused by failure to get railroad-cars after the exercise of due diligence in the attempt to obtain them, but is inapplicable to shut-downs caused by machinery troubles or poor market conditions.

*Bennett v. Howard (Kentucky), 195 South-western, 116. May 25, 1917.*

### MINING OPTION—ACCEPTANCE

Where an optionee under a mining bond goes on the property solely to examine and prospect with a view to determining whether or not he will buy, such actual entry and possession do not constitute an exercise of the option or render the optionee liable for payments under the option, even though in accordance with a parol understanding the optionee remains after the time for acceptance has elapsed in order to complete the annual assessment work for the owner.

*Johnson v. Clark (California), 163 Pacific, 1004. March 13, 1917.*

### MINER LIENS—FAILURE TO POST NOTICE

Where a co-owner of a group of mining claims permits his co-tenants to go into possession of the same and purchase materials and supplies for and employ labor in the development of the claims, without posting any notice of non-responsibility for them, he cannot estop lienors from establishing their liens

merely by a subsequent suit and judgment quieting his title to the entire group against his former co-owners.

*Bishop v. Henry (Oregon), 165 Pacific, 237. May 29, 1917.*

## Book Reviews

**DESCRIPTIVE MINERALOGY.** By William Shirley Bayley. 12 mo. Pp. 542. Ill. D. Appleton & Co., New York and London. For sale by the MINING AND SCIENTIFIC PRESS.

This volume is not intended as a book of reference; but rather to give a comprehensive view of modern mineralogy. The minerals selected for description, therefore, are not the most common ones, nor those that occur in greatest quantity, but those that are of scientific interest, of economic importance, and illustrations of some principle employed in mineral classification. The book is divided into three parts and appendices, and is sub-divided into 23 chapters. The first part, consisting of two chapters and 25 pages, deals with composition and classification of minerals, their formation and alteration. In the second part, in which are 19 chapters and 25 pages, we find descriptions of the minerals selected. They have been grouped together from a chemical rather than a physical standpoint. Thus, for example, we find sulphides, tellurides, selenides, arsenides, and antimonides in one chapter; chlorides, bromides, iodides, and fluorides in another; phosphates, arsenates, and vanadates in another, and so on. The third part is devoted to blow-pipe analyses and characteristic reactions of the more important elements and acid-radicals. This occupies two chapters and 16 pages. The four appendices, covering 32 pages, give a guide to the descriptions of minerals, a number of exceedingly useful well-arranged tables, and a bibliography that is far from complete. The book is well illustrated with 40 photographic reproductions and over 200 drawings. In all, nearly 700 minerals are described, and well described. The descriptions deal with their chemical qualities; physical qualities; crystalline form; action before blow-pipe on charcoal and in closed tubes, with and without reagents; effect of acids and other reagents; synthesis; occurrence and origin; place where found; and uses. The giving of the synthesis of minerals is unusual and goes to show the advancement of science in this direction. The chapter devoted to blow-pipe analyses, though not attempting to be exhaustive, is distinctly good, while in that given to characteristic reactions of the more important elements and acid-radicals there are some excellent tests not only for the common but for many of the rare elements. The tests, too, are well chosen, simplicity being the key-note when possible. The tables in the appendices, as we have said, are excellent, but with regard to them the author hoists a danger-signal that should be heeded. He says: "The most serious objection to the use of determinative tables lies in the danger that the student will feel, when the name of the mineral is obtained, that the object of his search is at an end, whereas their true aim should be to lead him to such a thorough study of the mineral that there will remain no doubt in his mind as to its real nature." He advises further that the tables are intended only to lead the student to the text in the main body of the book where the true distinction between the different species is to be found. The tables divide the minerals into two classes, namely, those with metallic lustre, which are always opaque on their thinnest edges, and those without metallic lustre, which are transparent in splinters and on their thinnest edges. There are 14 double-column pages of these tables. Nine pages of tables arrange the minerals according to their principal constituent. Thus, under cobalt we find: cobaltite, erythrite, glaucodite, linnaeite, smaltite. Finally, four and a half pages are given to a list of minerals arranged according to their crystalline form. The type is good, the cuts are clear and sharp, and the book is a convenient size. Anyone interested in mineralogy should have it on his shelf. F. H. M.

# INDUSTRIAL PROGRESS

## TELSMITH CRUSHERS

The Telsmith primary breaker is a novel type of gyratory machine which presents many interesting modifications of the so-called standard gyratory crushers which have been on the market for many years. Fig. 1 shows the primary breaker in section-elevation. *A* is the central shaft which is stationary and neither gyrates nor rotates. It is, in effect, a

FIG. 1

large forged steel bolt which clamps the spider tightly to the frame. *B* is an internal eccentric that imparts the gyratory movement to the concaves *D*, through the sleeve *C*. The eccentric is thus inside the head instead of below it. The head does not turn, but moves horizontally, the movement being similar to that of an eccentric-strap on a steam engine.

The advantages claimed for this type of construction are that of lengthening the eccentric whereby the area of the main bearings is increased two or three times, reducing the unit working-stresses and increasing the life of the babbitt lining. The level principle is discarded. Thus, the long springy centre shaft of the old type gyratory crusher and the correspondingly long two-piece crusher-frame are eliminated. A parallel stroke is produced through the action of the internal eccentric. This gives a crushing movement of equal amplitude at the top and bottom of the bowl.

The crusher-head is made in two pieces; the crushing cone, or bowl, and the liner. Two jack-screws *F* are provided on the liner for adjusting the cone vertically to change the opening and take up wear, while crushing-cone and liner function as one piece. A feather key prevents the cone from turning, and split lock-nuts on the jack-screws keep the head in position. Distance rings *G* of various widths are provided for the purpose of fixing the vertical height of the head and the width of the discharge opening.

The standard head and concaves are usually made of special-grade iron, chilled to an unusual depth. Manganese steel cones and liners may be supplied wherever the product to be broken is unusually hard and abrasive. It should be noted that the cone encloses not only the shaft but also the eccentric and liner, thus greatly augmenting the crushing area, and at the same time practically doubling the life of both cone and liners by reason of the increased area. The parallel stroke distributes the wear evenly over the entire crushing surface. The top of the heads and concaves work as well as the bottoms.

This crusher is made in seven sizes, varying from a receiving opening 7 by 37 in. to 21 by 90 in., each machine having two openings. The capacities range between 10 tons per hour to a 1-in. ring, to 500 tons per hour to a 4-in. ring. It is claimed by the manufacturers that this crusher does exceptionally good work on products which are difficult to handle in other types of machines. Especially good work is done on gravel and hard granite boulders, the horizontal stroke gripping the round smooth surfaces of the boulders as soon as they enter the feed opening. Slipping and jumping do not take place.

Fig. 2 shows the head liner with head lifted to show the feather key. The jack-screws are in posi-

FIG. 2

tion on the liner flange. The piece at the right is the eccentric with driving gear attached. The lower piece is the central shaft with taper bushings.

Fig. 3 shows an exterior view of the Telsmith reduction breaker. This is an interesting development of the Telsmith principle illustrated in section elevation in Fig. 4. This is a secondary breaker intended to follow the Telsmith primary crusher wherever an especially fine-crushed product is desired.

FIG. 3

It is not intended to be either a pulverizer or a primary breaker, but should be used only for secondary purposes. The chief point of difference in this machine lies in the head, which is made low and flat. The frame is even shorter than in the primary machine. It is cast in two pieces, walled and ribbed to withstand large strains. The crushing principle is the same, but the shaft is somewhat shorter. The top spider is cast into the upper section of the frame. The spider arms are short and heavy. The bottom spider is cast into the lower section of the frame with four large arms and hub. A shows the jack-screws; B the clamp bolts; C the wedge-ring screws; D the tightener screws, and E the adjusting shims.

The manufacturers report the following installations of the Telsmith primary breaker within the last 12 months: Braden Copper Co., four No. 7½'s; Kennecott Copper Co., one No. 8; Federal Lead Co., two No. 7½'s (making four in all); Thomas Iron Co., Wharton, N. J., one No. 7½; Chattanooga Coal & Iron Corporation, Chattanooga, Tenn., one No. 7½; Porphyry Dike Gold Mining Co., Rimini, Mont., one No. 5; United Eastern Mining Co., Oatman, Ariz., one No. 6; Rochester Combined Mines Co., Lovelock, Nev., one No. 7½; Pacific Mines Corporation, Ludlow, Cal., one No. 4; Arizona Middlemarch Copper Co., Pearce, Ariz., one No. 5; Deer Trail Mining Co., Marysville, Utah, one No. 3.

The first installation of a Telsmith reduction crusher was in a Pennsylvania limestone quarry some two years ago. The machine is said to have operated for two seasons without repairs. Another machine is in operation at the Standard Chemical Co., Canonsburg, Pa., where it is being used for crushing ferro-vanadium, while a plant is under construction

now for the Molybdenum Products Corporation, at Denver, consisting of one No. 6 Telsmith primary breaker and two No. 2-F Telsmith reduction crushers.

These machines are manufactured by the Smith Engineering Works, Milwaukee, Wisconsin.

## COMMERCIAL PUBLICATIONS

**VOLUTE CENTRIFUGAL PUMPS.** Worthington Pump & Machinery Corporation. The different types of volute centrifugal pumps manufactured by Henry R. Worthington are illustrated and described. The advantages of each type are set forth.

**WESTINGHOUSE OIL-IMMERSED SELF-COOLING TRANSFORMERS OF THE CAST-IN TYPE** are designed to meet the demand for transformers of moderate size. They are illustrated in leaflet 3562-A; Westinghouse Electric & Manufacturing Company.

**BUCHANAN ALL-STEEL ROCK AND ORE CRUSHER, TYPE C.** Bulletin No. 10, C. G. Buchanan Co., Inc., 90 West street, New York. A line of heavy crushers in sizes ranging from 24 by 36 to 60 by 84 inches, jaw opening, is described.

**LINK-BELT ELECTRIC HOISTS.** Book No. 246, Link-Belt Co., Chicago. The booklet describes a line of compact, self-contained hoists suitable for the operation of traveling cranes and trolley hoists.

**WESTINGHOUSE SYNCHRONOUS MOTORS FOR POWER FACTOR CORRECTION.** By Nicholas Stahl. Circular No. 1570. Westinghouse Electric & Mfg. Co., East Pittsburgh, Pennsylvania.

**HOW TO WASH FILTER CLOTHS.** Clenzall Machines Co. of America, St. Louis. The Clenzall

FIG. 4

washing machines and their use for washing filter cloths are described.

**ZELNICKER'S BULLETIN No. 224.** By the Walter A. Zelnicker Supply Co., St. Louis. The bulletin briefly describes pressure and storage tanks.

**CASINGS FOR LINK-BELT SILENT CHAIN DRIVES.** Link-Belt Co., Chicago. Dust and oil tight casings for silent chain-drives are described.

## TABLE OF CONTENTS

### EDITORIAL

	Page
NOTES .....	525
A NEW COPPER DISTRICT .....	526
Important contribution on the Mandy mine and Flin Flon lake copper deposits by Maj. Karri-Davies; ores formed near contact between schist and intrusive granite; opens new possibilities in central Canada; difficulties of exploration. <i>M. &amp; S. P., October 13, 1917.</i>	
AN AUSTRIAN MELCHIZEDEK .....	527
Count Czernin's peace programme analyzed; significance of the speech in connection with the recent Papal letter; an effort by the Central Powers to encourage the pacifists among the Allied nations. <i>M. &amp; S. P. October 13, 1917.</i>	
MR. HOOVER AND SULPHURIC ACID.....	528
Price of super-phosphate; comparison of prices of sulphuric acid and acid-making materials; some causes of the discrepancies; reason for inactive demand of fertilizers. <i>M. &amp; S. P., October 13, 1917.</i>	

### DISCUSSION

MILL-TESTS V. HAND-SAMPLING	
By CHARLES BENNETT .....	529
Consideration of Morton Webber's proposal to introduce the foot-weight factor in adapting mill-tests to accurate mine-sampling; dividing the mine into zones, using the mill-test to indicate sampling-errors, might have prevented miscalculation at the Alaska Gold. <i>M. &amp; S. P., October 13, 1917.</i>	
SECONDARY ZINC DEPOSITS	
By CLYDE M. BECKER .....	529
Discussion of article by Dr. Nason; enrichment by gangue-subtraction not confirmed at Hanover, New Mexico; observations at the Hanover deposits. <i>M. &amp; S. P., October 13, 1917.</i>	
MINING LAWS	
By C. M. EYE .....	530
Recommendations for classification of deposits to fit conditions in the Philippine Islands. <i>M. &amp; S. P., October 13, 1917.</i>	

### ARTICLES

RECOLLECTIONS OF MEXICO	
By A REFUGEE .....	531
Vacillations of the U. S. Government; orders to leave	

regardless of property; personal experiences of Americans in revolutionary Mexico. *M. & S. P., October 13, 1917.*

### A NEW CANADIAN MINING DISTRICT

By WALTER KARRI-DAVIES .....	534
Jottings by the way; stages in the journey from Winnipeg to Flin Flon; high-grade copper from Mandy mine on Schist lake; large copper-gold-silver-zinc property at Flin Flon lake. <i>M. &amp; S. P., October 13, 1917.</i>	

PRODUCTION OF PYRITE .....	536
<i>M. &amp; S. P., October 13, 1917.</i>	

### THE SYNTHETIC MAKING OF SODIUM CYANIDE

By G. H. CLEVENGER .....	537
Tests to check economic possibilities of the Bucher synthetic process; modification of original process, leaching cyanized briquettes directly with mill-solutions; description of apparatus; conditions for successful fixation of nitrogen as cyanide; practical leaching tests on gold and silver ores with synthetic cyanide. <i>M. &amp; S. P., October 13, 1917.</i>	

LARGEST INGOT MOLD EVER MADE.....	543
<i>M. &amp; S. P., October 13, 1917.</i>	

NON-FERROUS METAL EXPORTS.....	543
<i>M. &amp; S. P., October 13, 1917.</i>	

A SIMPLE HEAD-FRAME.....	544
Details of construction of self-dumping head-frame, for ore and water, with illustration. <i>M. &amp; S. P., October 13, 1917.</i>	

### CHEMICALS USED IN FLOTATION

By O. C. RALSTON AND L. D. YUNDT.....	545
Acids; theories to explain effect of; use of copper sulphate; increases recovery of zinc; deleterious with copper and silver ores; effect of lime and alkalies; caustic soda assists flotation of copper ores; organic acids with clayey ores; silico-fluorides; calcium sulphate with ores having a colloidal gangue; chloride of lime in separation of zinc-blende and pyrite; sodium cyanide with acid mill-water. <i>M. &amp; S. P., October 13, 1917.</i>

# G-E Complete Electrical Equipment for Cranes Assures Speed with Safety

G-E engineers have studied crane requirements and designed electrical apparatus to meet known operating conditions. Every requirement for stopping or starting, and the entire operating cycle is fully met by specially designed apparatus.

## Motors

Interpole motors, capable of standing heavy overloads, are manufactured in any speed or horsepower needed. These motors have split frames and large handholes for accessibility, and can be disassembled without disturbing back gearing.

## Brakes

G-E crane motors are furnished with automatic solenoid brakes which work without jar or shock and make automatic compensation for brake shoe wear. Brake shoes made of metallized asbestos compound give a high co-efficient of friction with but little wear.

## Resistors and Protective Panels

The G-E standard for crane equipment is to supply all resistor sections of uniform size, which reduces the number of spare parts needed to a minimum. The design of the cast iron grid resistance units is such as to avoid the danger of short circuits by vibration and double insulation protection against grounding is provided.

Protective devices are furnished in small panel units which can be attached in any convenient place. A push knob on master panel opens line in an emergency, and overload protection is afforded at all times.

## Controllers

Horizontal or vertical handle controllers are furnished which are absolutely reliable and very accessible. They are equipped with magnetic blow-outs, arc chute protecting covers, and many refinements which twenty years of controller building suggested.

Your inquiry for complete electrical crane equipment is solicited.

6876

**C**OST of the War to date is estimated at about 100 billion dollars, of which 25 billions, or one-quarter, has been incurred alike by England and Germany, leaving 50 billions as the money spent by the other belligerents. France and Russia are credited with 20 billions apiece.

**B**EGINNING on October 8, the 115th meeting of the American Institute of Mining Engineers will be held at St. Louis. An attractive programme has been arranged and much has been done to ensure the success of this gathering of the profession at the home-town of the president of the Institute, Mr. Philip N. Moore.

**F.** A. VANDERLIP is a type of the enlightened patriot. As president of the National City Bank of New York he has exhibited the highest intelligence and public spirit in many directions, particularly since the beginning of the Great War. Now he resigns all his regular duties in order to assist Secretary McAdoo in financing the Liberty Loan. His services, which are gratuitous, should prove of great value to the National purpose.

**Q**UESTION has arisen whether the Government's price for copper applies to sales made for the period beyond the four months specified in the agreement with the producers—for it was an agreement, not a peremptory dictation. It is said that 26 cents is asked for copper sold for the first quarter of 1918 instead of the uniform price now prevailing of 23½ cents. We expect that the War Industries Board will answer this question equitably by applying the present price to forward sales also, otherwise the intent of the agreement would be stultified. In these matters all concerned must forego any quibbling and do their best to live up to the spirit of the agreement, which is such regulation of the market as is helpful to the national purpose.

**O**UR people are asked again to provide the sinews of war. The second Liberty Loan must be as successful as the first, for we have the money and we have the obligation. Since the issue of the first loan our soldiers have begun to go forward to the battlefield and the youth of the country has been called to prepare for active

service. Those that cannot serve in that way can aid by contributing the money needed to bring the War to a victorious conclusion. This 4% Government loan is the most gilt-edged of all securities; it is particularly suitable as an investment for professional men. While the loan is sure to be a success, it is the duty of every citizen to help to crown the issue with an over-subscription to prove to all the world, particularly the hostile part of it, that our people are supporting the Government without reservation.

**F**LOTATION is being improved in a multitude of details, and some of the most interesting opportunities for betterment seem to lie in the peculiar properties of many chemicals both for modifying the physical state of the flotative medium and for cleansing and altering the surfaces of the minerals to be floated. This subject is treated at some length by Messrs. O. C. Ralston and L. D. Yundt elsewhere in this issue. They raise a question concerning the supreme importance of a change of surface-tension in the water that will renew interest in the investigation of this phenomenon. Above all they show how wide is the field for new discovery in the application of chemistry to the process. They are justified in their assertion that the art of flotation is in its infancy.

**E**FFORTS to control the price of silver are being made in defiance of the inexorable laws of supply and demand. The Indian government has prohibited both the import and export of silver, in order to protect its currency, endangered by the temptation to melt rupees into bullion. This will not prevent the conversion of coins into feminine jewelry nor the demand of prosperous workmen for silver in preference to paper. In India, as in France and England, the increase in wages calls for more silver coin, the prejudice against paper money being persistent. The recent eccentricities of the silver market, a big rise being followed by a sudden precipitous drop, are not surprising, considering the changes of value so suddenly created. Stores of silver have been brought into the market for realization at the high price prevailing. The 350,000,000 ounces of silver represented by minted dollars stored in the United States treasury against outstanding silver certificates represents a potential regulator of the market, for it may

become necessary in the interest of the United States and of our Allies to prevent an excessive appreciation of silver. Such control can be exercised easily.

**USERS OF CYANIDE** will welcome the article on the synthesis of sodium cyanide by Dr. G. H. Clevenger, which we print in this issue. It gives the results of an interesting series of experiments in the production of this chemical by direct fixation of the nitrogen of the air in the presence of a catalytic agent, following the remarkable method recently developed by Prof. John E. Bucher of Brown University. The process is revolutionary in its simplicity and economy, and possesses the merit of being adaptable to operations on a relatively small scale. Mr. Clevenger has shown the difficulties that will be met in practice and the way to overcome them. He has also tested the synthetic cyanide which he produced in the extraction of gold and silver from ores, with parallel tests employing the cyanide of commerce. The results are entirely satisfactory. The article is accompanied by a tentative flow-sheet which will be useful to those that may wish to follow the subject further.

**A REFUGEE** from Mexico gives a picture in this issue of the tribulations of the American citizen, deserted by his country, in a land rent by revolution. We need to be reminded many times of the low regard that our official policy engendered for American rights abroad. What then happened in Mexico had much to do with inspiring contempt for us in Germany, and it emboldened the Kaiser to assail us in ways that ended by drawing us into the War. We are now setting forth to redeem ourselves, and one splendid fruit of this great struggle must be to exalt the dignity of American citizenship, and to make it a guarantee of safety and just treatment among all nations. Conditions are said to be improving in Mexico, and perhaps our 'refugee' could now return without fear of the abuses formerly suffered, but it is too early to count on a change of heart in that country. We must first give proof of our prowess, and of our determination to make the world everywhere safe for Americans. After it has been made safe for Americans it will be quite a safe place for democracy.

**SEVERAL** members of the Mining & Metallurgical Society of America have written to us asking for aid in selecting the mining engineer to whom is to be awarded the Society's medal, which this year is to be given for "distinguished service in the administration of mines." This self-imposed task of awarding a medal every year is a gracious act, but it must be embarrassing at times. We could mention a hundred men worthy of a medal under the specification quoted, but we should dislike very much to be compelled to select one super-eminent in this branch of professional work. If a medal must be given we would like to see it awarded to some modest fellow on whom the rewards of wealth and prominence have not been bestowed already. But then his

"service" would not be of a "distinguished" kind, it may be urged. So the medal will probably go to one already possessed of such prizes as befell the successful. Nothing succeeds like success. It would be a nice thing if it were understood that the medal could not go to any member of the Society, which then would become a splendid jury for the awarding of these marks of distinction and thus have one more reasonable excuse for existing.

## A New Copper District

On another page we publish an account of a visit to the newly discovered copper deposits in Manitoba. This is written by Mr. Walter Karri-Davies, well known in South Africa as one of the two organizers of the Imperial Light Horse, which gave such splendid service in the Boer war. The name of Major Karri-Davies is part of the history of South Africa and we need say no more. The article is interesting not only as coming from a distinguished man but as giving information concerning a new copper-mining district in the North. Sundry descriptions of the locality have appeared previously in print. Mr. J. A. Campbell, the Commissioner of Northern Manitoba, has published an account of a trip he made thither last July. In that account he does not fail to descant upon the scenic beauty of the region. He refers to the Mandy mine, now controlled by the Tonopah Mining Company, but he makes no statement regarding its value. Concerning the Flin Flon, which was the object of Major Karri-Davies' trip, Mr. Campbell says that 6000 feet of drilling proved 6,000,000 tons of ore and that this "will develop into the greatest orebody of its kind in America." We fear that his opinion will not carry much weight after such a statement, for the largest body of ore of that kind is so vastly bigger than 6,000,000 tons as to make the comparison ludicrous. However, this healthy prospect justifies his next suggestion that the Flin Flon and Mandy ventures "will result in opening up a number of other claims in the district where mineral deposits have been shown to exist, and which, owing to their remoteness and the amount of money involved in handling them under existing conditions, make their development by present owners now out of the question," in short, that the prospects justify a vigorous exploration of the district by those possessed of sufficient capital. Another report worthy of note is by Messrs. R. C. Wallace and J. S. Delury of the University of Manitoba. These geologists describe the formation of masses of copper-bearing sulphide ore, containing gold and silver, in sericitic schist near the contact with intrusive granite, presenting conditions, as our readers know, often associated with pyritic bodies of lenticular shape, when of magmatic origin. They mention seeing at Flin Flon "an almost solid mass of chalcopyrite and zinc-blende, 25 feet wide in the centre, the sulphides grading into pyrite on both sides." Besides the copper lodes there are gold-bearing quartz veins. The finding of these on the shore of Herb lake incited the first prospecting in the region.

These also show lenticular masses of some extent in which the gold is associated with arsenical pyrite. The presence of tourmaline marks them as contact deposits, and we cannot say that the description is prepossessing. They remind us too much of the Lake of the Woods. However, if they contain enough gold to yield a profit, we need not dispute over the character of the geologic environment. The best evidence of a gold mine is gold not mixed with too much quartz or other valueless rock. Undoubtedly the discovery of large bodies of copper-sulphide ore in this part of Canada is a notable event. It is likely to lead not only to the development of one or two big mines, but it will furnish a new point of departure for intelligent exploration in a vast region full of possibilities. Those that have been in this glaciated country, one of inundated *roches moutonnées*, as the geologist sees it, are well aware of the difficulties presented to the search for veins and lodes underneath the mantle of moss and drift that covers the surface. Moreover, so large a part of the region is covered by shallow lakes that the search is further hindered by another obstacle even less easy to circumvent, although in the Lake of the Woods district and on Silver Islet, in Lake Superior, the miner sank shafts even under the water. We believe that the Canadian government will be wise in assisting bona-fide exploration in northern Manitoba, both by giving the scientific aid of its Geological Survey, as already done, and by encouraging the building of branch lines of railway. In some cases transport by water can be facilitated by blasting the rocky bottom of rapids and by building short tramways at portages between the lakes. The presence of the precious metals in the copper lodes is of particular significance and encourages the expectation that a local mining industry of some importance may be established. American capital is participating in the development of the region and we venture to add that the Canadian people at this time are particularly friendly to enterprise originating from this side of a frontier on which no fort has been built or is ever likely to be built. Cordial co-operation is assured.

## An Austrian Melchizedek

Count Czernin has spoken, so that we now know somewhat more of the mental aberrations of the Central Powers. It is not our purpose to treat his utterances with levity, for he speaks with the authority of his Emperor, and the Austrian throne is in the same position as "me too" Platt when Roscoe Conkling committed a certain irreparable and famous political blunder. What Count Czernin says regarding the peace of the future reflects the mature ideas of Kaiser Wilhelm as to what he would have the outer world believe. Dr. Michaelis recently treated us to a masterly expression of Prussian contempt for the military power of the United States; he brusquely read us out of the list of worthy foes, which may serve perhaps to render us more fully conscious of some of our defects which may have looked

larger than they are when viewed through the Teutonic microscope. Taking us in the large we will disappoint this microscopic estimate of the German chancellor. The after-dinner speech of the Austro-Hungarian Minister of Foreign Affairs, however, is not all bluff; it represents a point of view that will affect many people whose sentiment occasionally proves toxic to their practical patriotism. When Count Czernin tempers his announced policies in pretended accord with the spirit of Pope Benedict's recent appeal, he is playing on a very ancient and historic chord that has not yet wholly lost its resonance. Although the Holy Roman Empire as an actual force in world-politics faded away long before the Napoleonic era, the formal abdication of this imperial dignity by the house of Austria took place barely a century ago. The Emperor at that time possessed a sufficient sense of humor and self-respect to insist no longer on a form that had no substance. Nevertheless the Empire of Austria has continued to occupy a peculiar position in the affection and confidence of the Papal councils. When the Austrian minister ventures to announce what purports to be an interpretation of the Pope's letter we may assume that the construction he puts upon that document is not entirely without sanction.

Coming at the same moment with the revelations of the duplicity of Bolo Pasha and Count von Bernstorff, the attitude of this mouthpiece of the Huns as an advocate of a peace to be established on broad humanitarian principles is interesting. Likewise Bolo Pasha and Count von Bernstorff were preaching the doctrine of love and amity among men, and at the same time buying newspapers to promulgate falsehood in order to befuddle and mislead the world into acceptance of a 'German peace.' Bolo Pasha was the arch peace propagandist, encouraging well-meaning sentimentalists to impede, in the name of humanity, every sane effort to prepare for the protection of our country, and now we find that he and the former ambassador from Germany were distributing a vast 'slush fund,' a nasty name that suits the nasty purpose to which it was applied. Our good people who used to preach the doctrine of submission and national impotence so earnestly should now be filled with shame and remorse. Their folly has helped to plunge us into a war from which we would have been saved by preparedness. Count Czernin, however, is clearly of the opinion that the pacifists have not fully recovered from their delusion, and he poses as the modern Melchizedek. In his speech at the dinner given by the Hungarian minister, Dr. Alexander Wekerle, he insists over and over upon the willingness of the Central Powers to come to an agreement for peace upon the basis of disarmament and arbitration. This is the fundamental idea in his announcement. As a corollary to it is, specifically, naval disarmament, although he would not extend this to the narrow or territorial waters, whereby the high-seas would become severely modified by application of the principle of the *mare clausum*. Conceding these two basic doctrines, he argues that "every ground for territorial guarantees disappears," which is a unique

way of proposing to defend the principle of nationalism. He might have stated this thesis more boldly had he been convinced of the essential benefit of nationalism as a factor in human development; but he was thinking of the anger of an outraged world that might disrupt the two empires that have filled the earth with destruction and sorrow. Finally he proposes the relinquishment of economic war . . . by the opponents of Germany and Austria! This is to trifle with the one great principle that could insure the peace of the world. He would apply it to his enemies, not to the Central Powers which have not forgotten in the midst of war to make preparation with increased factories and an augmented merchant marine to go forth under the shield of Teutonic protectionism to the commercial conquest of the Earth after Mars has sheathed his sword. Disarmament on land, disarmament on the high-seas but not in the *mare clausum*, absence of territorial guarantees, and abandonment of the economic war by the enemies of the Teuton only, is the "pacific and moderate programme" set before the world by the spokesman for the Kaiser under cover of Austria's historic pretensions to second, as a temporal power, the spiritual manifestoes of Rome.

## Mr. Hoover and Sulphuric Acid

Great Britain, by order of the Minister of Munitions, has fixed the price of super-phosphate, based upon the percentage of tri-basic or mono-calcium phosphate present. The maximum prices are \$22.50 per long ton for super-phosphate containing from 15 to 16% of the soluble salt. This shows that the British farmer is worse off than the American, since the current Atlantic seaboard quotation for acid phosphate is from \$16 to \$18 per ton. Meanwhile crude unwashed Spanish pyrite, averaging 48 to 52% sulphur is worth 16 cents per unit of 20 pounds at Philadelphia and Baltimore, a price that has remained stationary since March last, although the quotation on acid phosphate has risen 34% within that period. The difficulty of obtaining pyrite is, therefore, not as real as it has been represented, despite the sudden flurry at the beginning of the ruthless submarine campaign. Another interesting circumstance is that sulphur has likewise sold quite steadily at \$35 per ton in the open market for many months, and the demand, though large and insistent, has not justified the erection of expensive plants to produce it in large quantity from the abundant low-grade deposits in various parts of the country. It is difficult to penetrate the mysteries of commodity markets, but it is quite certain that no real shortage of raw material for making super-phosphate exists. Enormous deposits, actually stupendous deposits, of high-grade phosphate rock lie untouched and undeveloped in Utah and Idaho; the great smelters within range of these supplies are just beginning to convert their waste fume into sulphuric acid, and are doing it cautiously with full realization that the demand for fertilizer is not sufficiently acute to warrant the build-

ing of elaborate plants. Florida phosphate rock averaged about \$3.45 per long ton before the War, and is now quoted at from \$3.25 to \$6 according to grade. The average has not increased in proportion to the advance in price for the finished product. California has an enormous developed tonnage of pyritic ores that will assay more than 48% sulphur and 1% copper with small amounts of gold and silver, and these could be loaded on vessels at San Francisco bay at a cost that would compare not unfavorably with Rio Tinto pyrite put on ship at Huelva. The Calumet & Arizona Mining Company has such great quantities of pyrite developed in its Junction and Briggs shafts at Bisbee that it could produce 1000 tons per diem of material that would average higher than 45% sulphur and 2% copper, with a fair assay value in gold and silver, if the Council of Defense deem it important enough to arrange an emergency railroad-rate for the sake of hurrying this acid-making material to the producers in the East. We have heard of the struggle of the acid manufacturers to obtain sulphur-burners to replace their pyrite roasters, in order to maintain the supply of sulphuric acid for munitions and fertilizers, and we also hear of restrictions upon the exportation of sulphur; and 60° sulphuric acid, furthermore, is still selling at about \$25 per ton, although it formerly sold at \$6 and less when Spanish pyrite was laid down at the works for 9.75 cents per unit of sulphur. The elevation in the price of Spanish pyrite has been 64% against a corresponding rise of 316% for the acid. Here is a trade mystery that needs explaining. The world measures its advancement in the arts by its consumption of sulphuric acid, as emphasized by Disraeli and other statesmen and thinkers of long ago. It is as true a measure as can be found, and the selling price of this essential may also serve as a measure of commercial values in other industries. In this instance it may prove to be a convenient measure of inflation, and may merit the serious attention of the price-regulators. The cost of fertilizers is vitally related to the cost of food, to the cost of labor, and in logical sequence to the cost of producing metals, and Mr. Hoover may become exercised over the fact that the farmers, shrinking from the enormous prices, are adopting cheaper make-shifts in fertilization. These may be useful in their way, but they would be more valuable as a sure reliance if combined with plenty of the old dependable acid phosphate. The farmers are even skimping the land, putting it on short rations, so to speak, as well as the tiller with his meatless and wheatless days. 'Hooverizing' is excellent as a means of economy and for the cure of over-worked livers; a less bilious people will do better work in overcoming the unspeakable Teuton, but we must not apply Hooverizing to the soil. Evidently there is no need, if the powers possessed of the proper authority look carefully into the question of fair prices for sulphuric acid and super-phosphate, now that the locked treasure of potash in Searles Lake has been set free by recent legislation, so that this necessary may be abundantly supplied.

## Mill-Tests v. Hand-Sampling

The Editor:

Sir—I have read with interest the article by Mr. Morton Webber on this subject appearing in your issue of July 28. I was particularly struck with the care in the example cited called the Red mine in obtaining a representative sample for a mill-test that would reflect the proper proportion that each stope of the mine would contribute, if operated under large-scale conditions. As Mr. Webber points out, it is impossible to break down the backs of a stope in a mine under examination so that each stope will contribute its proper portion to the mill-test. He states one stope will break down 50% over its proportion, while another would break 100% in excess of its proportion. He states it is here most mill-tests or car-shipments to a smelter (for the same purpose) fail. In this I thoroughly agree. The method devised by Mr. Webber depending on a "predetermined foot-weight" is, I think, the most accurate and practically convenient method that could be devised. The intention to break more rather than less than the required foot-weight is also an important point, the idea being, as explained, to prevent going back and tampering with the face to obtain the deficient portion.

My object in contributing to the subject is because I am a believer in the mill-test if properly conducted, but my experience is that extremely few mill-tests are properly conducted; for the reason that the above fundamental requisites are not usually considered. There are many text-books on the mail-sampling of mines, but I know of no standard work on the mill-test as a mine-sampler. Many of us, at one time or another, have shot-down various stopes in a mine and flattered ourselves we were 'sampling' the property, when as a matter of fact we did not, because we failed to realize the fundamental necessity of the 'foot-weight' as described in Mr. Webber's article.

Referring to the last paragraph of the article where reference is made to the mill-test as an indicator of the sampling-error for hand-sampling large low-grade deposits, it is not clear how such a method should be devised—as the detail is not outlined.\* If, however, it was possible to divide the mine into zones using the mill-test as the sampling-error indicator for various zones, as described by Mr. Webber, an obvious advance would be gained, and if practicable, would no doubt have pre-

vented the failure of the Alaska Gold property, which, I understand, was the inception of your editorial and the interesting and constructive outcome that followed in your paper.

CHARLES BENNETT.

London, September 3.

## Secondary Zinc Deposits

The Editor:

Sir—In his interesting and clear-cut article, appearing in your issue of May 19, Dr. Nason advances a theory of enrichment of secondary zinc deposits by the subtraction of gangue-material. This clarifies some puzzling problems encountered in the study of oxidized zinc ores. I know that Dr. Nason is particularly qualified to write on this subject and that it was chiefly through him that the great zinc mines of the Empire Zinc Co. at Hanover, New Mexico, were discovered. Nevertheless, I do not believe that his theory of residual zinc deposits is applicable to the zinc deposits of Hanover, as he states in the article.

The zinc ores of the Hanover district are found in the sedimentary metamorphic zone, surrounding a quartz-monzonite-granite batholith. The sediments are heavily garnetized, and all the primary ores of the district are zinkiferous garnets, the alteration varying from slight to complete metamorphism. It is evident that the zinc accompanied the other volatile garnetizing agents and is a constituent part of the rock-mass.

There appear to be two horizons of garnetization, (1) the upper portion of the crystalline lime and the blue lime immediately above it, and (2) the lower portion of the crystalline lime and the basal sediments underlying that. The crystalline lime is approximately 150 ft. thick and is about 200 ft. above the basal granite. Late evidence, namely the finding of zinc-sulphide ore at a depth of 200 ft. in the Republic mine, where the sediments are known to be thin, lends weight to the theory that garnetization and mineralization will extend down to the basal granite.

The oxidized orebodies are found immediately below the upper garnet. This formation is usually the crystalline lime. When precipitated under these conditions the ore is always a carbonate, as are the ores of the great Antonio mine, discovered by Dr. Nason. But in one important instance, the Pewabic mine of the Hanover Copper Co., a stratum of silicious shale lies between the zinkiferous garnet and the crystalline lime; and here the oxidized ore is the hydrous zinc silicate.

\*This was explained in detail by Mr. Webber in our issue of September 29, 1917.—EDITOR.

It is my contention that the oxidized ores of this district are a direct result of the decomposition, by meteoric waters, of the upper zinkiferous garnets; that the zinc, instead of being residual, has been the first metal to migrate, being re-precipitated by the first precipitant encountered; and that the character of the ore, whether carbonate or silicate, is controlled by the character of the precipitant.

It appears to me that this theory is borne out by the conditions in the field. The first indication of an oxidized orebody, not actually exposed by the erosion of the decomposed garnet, is a low-grade residual iron gossan, which shades off quickly into a soft decomposed hornblende material, undecomposed portions of which show zinc and often lead sulphides. The decomposed hornblende usually contains small amounts of oxidized zinc and lead. Underlying this decomposed garnet in the formerly barren crystalline lime are the secondary zinc ores. They are peculiarly free from all impurities. Inasmuch as the primary ores usually contain lead, iron, etc., and the oxidized ores are free from them, it is evident that they are the result of the selective leaching by descending solutions.

In one remarkable instance, the Bond mine of the Hanover Copper Co., the garnet in decomposing gave up its silica as well as its zinc. Crystalline lime underlies the garnet at this point. The resultant orebodies are enclosed in a true 'honeycomb' quartz, each cell filled with zinc. This ore effervesces weakly upon the application of hydrochloric acid, showing carbonate, but along the walls of the cell the ore has the radial crystalline structure of calamine. I have never found this ore to assay above 33% zinc, but when exposed by erosion the zinc leaches out, leaving the quartz behind as light as pumice. Below this pumice-like quartz, in the crystalline lime, the purest and highest grade of smithsonite ever found in the district has been mined.

Dr. Nason refers to the carbonate orebodies that abut against a low-grade zinkiferous garnet in the Antonio mine. I have studied this particular condition and I am convinced that it is due to faulting, there being absolutely no shading of one formation into the other. The change is abrupt and clearly defined. Along the course of the fault a little oxidation occurs in the garnet, but these ores are always low-grade and impure, while the abutting carbonate orebodies are of an exceptionally fine grade and quality.

In these carbonate orebodies of the Antonio mine and in the other oxidized ores of the district, residual pebbles and boulders of the replaced formation are common. These are always absolutely barren and unleached. The attacking solutions have come from without and not from within. A boulder presenting the appearance of solid ore is often found to have only an outer shell of ore, a second shell of gypsum crystals and ore, and a core of crystalline lime. Gypsum crystals are always most plentiful (except where found in vugs) where an orebody has floored on a solid bed of the lime, which lies

in a manner to check or completely impede the descending solutions. The presence of gypsum crystals in the oxidized orebodies seems to indicate that the zinc came down in the form of a sulphate and that the result of its reaction with the lime was zinc carbonate and calcium sulphate.

In the Maggie mine, five miles north of Hanover, in Little Shingle canyon, a very low-grade zinc carbonate changes within a few feet to sulphide. The surface ore assays from 3 to 8%, and the sulphide from 10 to 25% zinc. The gangue here instead of being zinkiferous garnet is an almost unaltered soft lime-shale, and the conditions are ideal, apparently, for the operation of the theory of segregation of the zinc through the leaching of the gangue-matter; yet the converse is true.

During the past two and one-half years I have studied every known zinc deposit in this district, and am convinced that the theory of replacement of the limestone by descending zinc-bearing solutions, whereby a barren formation has been transformed by constant enrichment to commercial ore, is the only theory that accounts for the results.

CLYDE M. BECKER.

Hanover, New Mexico, September 25.

## Mining Laws

The Editor:

Sir—In making recommendations for needed changes in the mining laws at present in force in these islands, I have been impressed by the lack of a proper classification of claims. I am therefore proposing the following classification, which I believe covers the field.

(1) **LODE CLAIM:** This shall be understood to apply to all lands containing veins or lodes of quartz or other rock in place, bearing gold, silver, mercury, tin, lead, zinc, copper, tungsten, or other valuable metals or the minerals thereof, in workable or appreciable quantities.

(2) **PLACER CLAIM:** This shall be understood to apply to all lands containing deposits of an alluvial nature, bearing gold, silver, platinum, or other precious metals in the native state, or containing minerals of tin, tungsten, copper, lead, zinc, or of other metals, susceptible of recovery by washing or concentration from such alluvium.

(3) **FUEL CLAIM:** This shall be understood to apply to all lands containing or suspected of containing deposits of coal, oil, peat, bitumen, asphalt, natural gas, or other hydro-carbon substance capable of being used commercially for fuel or in manufacture.

(4) **QUARRY CLAIM:** This shall be understood to apply to all lands containing stone or earth or earthy minerals of commercial value, such as building stone, limestone, iron ore, manganese ore, salt, sulphur, infusorial earth, guano or other phosphates, soda, potash, nitre, and all other non-metallic mineral substances of commercial value, including cement rock, sand, and gravel.

C. M. EYE.

Baguio, Philippine Islands, August 24.

VILLISTAS ON THE MARCH

THE RAVAGES OF WAR

## Recollections of Mexico

By A REFUGEE

Now that we are safe on this side of the Rio Grande, where neither Carrancistas, Zapatistas, Villistas, nor any other kind of 'istas can touch us, even though we tell the whole truth about them and their unhappy regimes, we can indulge in a few reminiscences. Since the revolution began in 1910, the life of the American residents of Mexico is best described in the words of that little verse that goes something like this:

"In again, out again,  
On again, off again,  
Home again, Flanagan!"

For in the last five years as many orders have come from Washington for its citizens to "get out" of Mexico, as though "getting out" of your home was the merest trifle in the world. The only way to appreciate just how we felt when these famous warnings came is to imagine what it would mean to you to be ordered periodically to leave your home and business, knowing that when you returned you would find, at least, your interests neglected, if not ruined. Caretakers are only human, and get tired of a continued performance; in time they begin to feel that they own what they were left to care for. And yet that is what the citizens of the United States living in Mexico have been forced to do repeatedly: to leave their all. If we had known even how long we would have to remain away, we might have arranged our affairs more advantageously. Often we left, thinking that it would be necessary to remain away but a few days, until this or that trouble blew over. But the uncertainty of safety would oblige us to stay away for months at a time. We could make no plans, as our future was so uncertain, always expecting that the American government would take some steps to safeguard our lives and properties, and that we would be able to return to our homes. Surely those who blaze the way for American trade and commerce deserve protection. One of the hard parts, during these enforced absences, was to maintain a second

home in the United States while our houses in Mexico stood vacant. After becoming discouraged with watchful waiting, we would return to take our chances once more in Mexico until the 'next time;' which was never far. Remedies for our situation have never been wanting. A favorite one is "Why don't you sell out all your interests and leave Mexico for good?" But who will buy? The wealthy Mexicans are all living in exile, and the Carranza government has decreed that no more foreigners may acquire property in Mexico. Even if we could realize on our Mexican holdings, there would be difficulty in finding any one rash enough to venture now into that disordered republic, in spite of its vast resources. And it is one easy for anyone accustomed to doing business in Mexico, where different modes, customs, and laws obtain, to adapt himself to new ways in this country or to stand up against the competition of established firms. We have even been advised to live with relatives, until such time as Mexico is normal. Though they too urge us to flee when danger threatens, we would be precious welcome, as anyone who has ever tried this expedient can testify!

Then again we are asked "What do you gain if you do save your property by endangering your life?" Most of us feel that there is small choice between being shot if we stay or of starving if we go.

Advice is never lacking, but no relative and no government offers to pay our expenses or set us up in business. We are simply advised to go, at any cost, no matter what the nature of our business, the limit of our income, or the size of our family. After the first few warnings from Washington came to naught, we decided not to heed them in the future, so when the next order to leave came, we refused to heed our consul, though he notified us daily of some special refugee train from farther south that was passing through our town. Finally the consul was recalled; believing then that intervention was at hand, and that the last train was leaving, we made up our

minds to go too just one hour before train-time. How we rushed around, throwing things into trunks and suit-cases, food into baskets, filling bottles with water, for well we knew from past experience that there would be nothing on the train. There was no time to call a *coche*, so we rode down to the station atop our trunks in an express-wagon. So great was our haste, we left the house with our shoes unbuttoned, but one of us had the presence of mind to grab a button-hook, as we rushed out! We reached the station just as the conductor called out *vamonos*, which, being interpreted, means 'All aboard.' But often when instructions came to leave the country, there was nothing to go in but box-cars, and many of us have made the trip thus, perched on a suit-case but glad of the chance to be able to ride at all. They could hardly be called *de luxe*—the trains in which we have traveled in our various flights from Mexico.

Even on those rare occasions when we were fortunate enough to get a Pullman or day-coach, there were never any lights, or water, or anything but the car. Imagine a pitch-dark car at night, without a porter or conductor even. As to bed-clothes and food, we carried our own, and always had to provide for several weeks, as we never knew how long we might be on the road. Mere special and passenger trains were side-tracked at any old place in order to accommodate the many military trains on the road. But we did not waste time pitying ourselves; we considered ourselves lucky to get away with a whole skin. There were times when warnings came to quit the country, that the train service was so poor that the refugees would have to wait at the station several days for a train, going home to eat and sleep, but coming back to their post until a train happened to come along. There was no regular schedule, and the station-agent either would not or could not tell when a train was due. These exoduses had their amusing as well as pathetic sides. One time a Scotchman was commissioned by the foreign consuls to go to the outlying districts in our State to notify all foreigners living there to come into town in order to leave the country on a special train that was to go on a certain day. After advising those living near-by, the Scotchman decided to save himself a long horseback ride by telephoning the news to a distant American mining camp, from the little village he was in. There was only one long-distance telephone and that was in charge of the Mexican military authorities, and they were not supposed to know until after the exodus. Nevertheless the Scotchman asked permission to use the telephone and his request was granted, but on condition that his business be transmitted in Spanish. Now the Scotchman's knowledge of Spanish was very limited, consisting of several words only; besides, the nature of his message was rather delicate to have the military authorities know. Possibly that is why they insisted upon the Spanish, having surmised the situation. However, the poor Scotchman used all the Spanish at his command, but the American mine-owner at the other end of the line failed to get his meaning. Finally, to the relief of the distracted message-bearer, the soldier on guard relinquished

his vigilance long enough for the Scotchman to get in two good old English words, "Beat it." Needless to add, it did not take the Americans at the mining camp long to get his meaning and act on his suggestion.

Once, having been asked by a friend in the United States to explain the exact procedure of getting the Americans out of Mexico, every time relations between the two countries were strained, the inquirer replied, in all seriousness, "Oh, I thought that the President wrote each one of you a note."

A mildly pathetic incident happened just before our last flight from Mexico. A foreign-refugee train from farther south was detained for days by military operations, in our home-town in the north. As the refugees had several little babies and children and had been on the road so long, in crowded day-coaches, the American residents of the northern city invited the refugees to their homes that they might rest, refresh themselves with baths, etc. Of course, the refugees dared not leave their train without some guarantee from the military authorities that their train would not be ordered to move during their absence. But this the authorities refused to do, so the tired travelers spent many more weary hours in their crowded cars, and instructions to pull out came several days after.

In our various flights to the border we have had many a thrill. The last time we fled from the wrath of Villa, suddenly our train came to a stop, away out in the desert, where there was no sign of human habitation. As we were close to one of the bandit's favorite hiding-places, we were thoroughly alarmed to see a large body of horsemen approaching the train. The soldiers that the military authorities had sent to guard our train grabbed their guns as they jumped to the ground and the male passengers, also heavily armed, took positions at the doors and windows of the car, ready for any emergency. The captain of our escort went bravely to challenge the men. Imagine our relief to learn that they were Government scouts and not bandits coming to hold up the train, as we had feared. Our train carried no lights, not even a headlight, but as darkness came on we felt more and more apprehension until the last Mexican town was reached and only the international bridge lay between us and safety. Across the river on all sides we heard the slogan, 'Remember Columbus; remember Santa Ysabel.' But we were trying to forget.

Some of the refugees have established themselves in business in this country, but many are idle, depleting their small fortunes, the fruit of years of labor in Mexico. And the exiled Mexicans, whose only crime was the possession of wealth, dare not return to their native land. Their confiscated houses and lands have not been returned to them, as Carranza promised. Their beautiful homes have continued to be used as barracks, stables, and even abattoirs, exactly as in the days when Villa ruled. Though we hoped for better things when Carranza came into power, the situation remains the same. When the City of Mexico was under Carranza's rule and we in the North were in Villa's dominion, a friend wrote "While

COMMISSARY OF THE MEXICAN ARMY

MACHINE-GUNS IN CAR AND SOLDIERS TO GUARD REFUGEE TRAIN

you are praying for Carranza to come into power there, we are just as earnestly wishing for Villa here, for while Villa may not be any better than Carranza, he cannot possibly be any worse." All industries are paralyzed, chiefly because Carranza has made such a fiasco of finance. Had he allowed the old Federal bills to circulate instead of throwing them out, thousands of people would have been saved from ruin. Instead, he reeled off his own fiat money, as a printing-press makes handbills. And although it had no backing, Carranza declared each paper dollar worth ten cents gold. He, of course, had dreams of confiscating mines, oil-wells, etc., to back his currency. To appreciate the havoc wrought by the repudiation of the Federal money, imagine if you can, a president of the United States declaring null and void the legal tender of the country. Outside of a few native products, such as corn and beans, most articles of food and clothing come from the United States, so the merchant must pay gold for his goods. How then can he continue to do business in Mexico while he is obliged to sell for worthless paper money, as he has had to do the past few years? Just now silver is again in circulation. Of course, if he could charge paper or silver money in proper proportion to his outlay, it would be another story. But the Government has made decrees forbidding exorbitant prices. They fix the value regardless of the merchant's purchasing price and the gold duty they have been known to charge on imported goods, even during times when it was a crime for a private individual to refuse the paper money. The reason given for forcing the merchants to sell at impossible prices is to help the poor. How they have been helped, the spectacle of the country in ruins, financially, industriously, and literally is the most significant answer. The poor were a thousand times better off when there was honest labor for everybody, and when their wages were paid in real money.

The poor, as well as the rich, the native as well as the foreigner, all have suffered at the hands of the brigand governments of the past five years. The only ones who have benefited are the military grafters themselves. We are tired of war, we do not want either internal strife or outside intervention. All we hope is that any faction strong enough to preserve peace and order may attain ascendancy, so that we may return to our abandoned

homes and neglected businesses, exiles and refugees no longer.

"Rough-piled, far-flung, unending, range on range  
And still beyond all wrapped in purple mist,  
Are mountains dimly beckoning."

IN AN ADDRESS by W. S. Kies at the Chemical Exposition in New York he stated that in 1914 this country exported, in round numbers, chemicals, drugs, and dyes to the amount of \$27,000,000. In the fiscal year 1917 these exports amounted to \$185,000,000; but this does not tell the full story because the list of exports does not include the great group called 'explosives,' which is so closely allied to the chemical industry as to be in fact a part of it. In explosives the value of the exports grew from \$6,000,000 in 1914 to \$820,000,000 in 1917. Under this class were listed cartridges, dynamite, and gunpowder. Under the heading 'other explosives,' the exports grew from \$1,000,000 in 1914 to \$420,000,000 in 1917, showing that in the industries closely allied with chemistry the growth has been quite as striking as in chemicals proper. In the articles which may be considered as strictly chemicals, we exported in 1914 \$500,000 worth of acids; in 1916 \$24,000,000, and in 1917 approximately \$55,000,000 worth. Our dye-stuffs exports have grown from \$333,000 in value in 1914 to \$12,000,000 in 1917, and these latter figures do not include foreign dyes re-exported. A few other illustrations may be of interest. Our exports of soda salts and preparations grew from practically nothing in 1914 to \$18,000,000 in 1917. The importance of the chemical industry is evidenced by comparison of the amount of capital and the value of the products turned out with that of other leading industries. According to the census of 1915, the value of capital of the group known as 'chemicals and allied industries' was \$723,000,000 in 1914. The capital of the automobile industry in 1914 was \$408,000,000, and the capital of the flouring-mill industry was \$380,000,000. The amount of capital invested in the group distinctly classed as chemicals was, in 1914, \$224,000,000, which represents an increase of nearly 800% since 1880, and the value of the products was \$158,000,000, or 70c. per dollar of capital invested.

# A New Canadian Mining District

By WALTER KARRI-DAVIES

In Australia a new chum takes to the bush and a sun-downer goes to town to knock down his check. In South Africa a roineck treks across the veldt and a backvelter inspans for the nearest dorp to nacht mahl. In Canada a greenhorn hits the trail and an old-timer goes to town to have a blow-out.

In taking these jaunts, thoughtful kindness on the part of all concerned is important. The old-timer is just as apt to require friendly guidance when he steps into his boiled shirt at Ritz-Carlton as the greenhorn when he steps into his canoe in north-western Canada. It would be surprising if it were otherwise. One finds it easier to forget than to remember that this is true.

It is a little difficult to say where one first hits the trail. A Pullman sleeper and a dining-car can no more be called the 'trail' than the new stern-wheel river steamer 'Nipewin' with its comfortable berths, excellent food, and good attendance. These luxuries are better described by saying that "we struck it rich." In our case we might fairly say we hit the trail when we started from Sturgeon landing. It was there we took to our feet and launched our canoes.

We started from Winnipeg, Canada, by train for The Pas at 9 a.m. on the 6th of August and arrived at our destination at 8:30 next morning. The Pas is a frontier town, but it is clean and comfortable. Take a map of North America, find Lake Winnipeg, picture yourself standing on the north-west corner of the lake facing west. Walk 90 miles due west and you will come to the place where Sir John Franklin's sailors wintered. You may enter the little church and see the seats that his sailors carved, all of which are in good preservation. This is The Pas, in Manitoba, on the bank of the Saskatchewan river.

At 1 p.m. on August 9 we started down the river on the 'Nipewin' of the Ross Navigation Co., Captain H. H. Ross in command. The Captain belongs to the cultured pioneer type. In normal times he spent part of his life shooting pheasants in England and the rest of the year shooting rapids on the Saskatchewan.

It was from my comfortable shake-down on the deck of the 'Nipewin' at about midnight that I first saw the northern lights. They are too beautiful to describe; all I can do is to write my impression as I wrote it for my children. It seemed to me as if the great torch-lights of eternity were being flashed by The Almighty to light the fairies on their joyous way from the stars and planets to Heaven, where they arrived bright and happy, and the angels tucked them in and kissed them good-night; then the lights went out and all was peace.

Next day we arrived at Cumberland House, which is the oldest Hudson Bay trading-station in Manitoba, having been established in 1774 by Samuel Hearne. Crossing Cumberland lake and Namew lake we arrived at Sturgeon landing at the mouth of the Sturgeon river at 5:30 p.m. on the 11th. This trip can be done in 16 hours, but we were delayed owing to the necessity of tuning up the engines on a maiden voyage.

The name Sturgeon landing expresses all there is to say about this spot. From here last winter the Mandy mine transported about 3600 tons of high-grade copper ore over the ice from the mine on Schist lake, about 65 miles away, the ore being loaded on barges and towed to The Pas, whence it was sent by rail to the smelter at Trail, B. C., 1200 miles away. I understand that the ore assays about 22% copper, 7% zinc, \$2 gold, and about 3 oz. silver per ton. A heap of about 1500 tons of ore was still awaiting shipment. Messrs. H. C. Carlisle, D. M. Haynes, and C. B. Morgan, together with 100 men and 92 teams of horses were responsible for this creditable piece of work of hauling the ore in the depth of winter over the ice.

At 5:45 a.m. on August 12 we sailed forth from Sturgeon landing, our party consisting of Messrs. Jack F. Hammill, Henry C. Perkins, John H. Black, William Wallace Mein, the brothers Dan and John Mosher, myself, and four Indians, together with three canoes, tents, mosquito-nets, eiderdowns, food, fishing-tackle, guns, knapsacks, etc. The natives poled the canoes up the rapids with two of the party to help. The rest of us tramped for nine miles, the walking being over moss, which is called 'muskeg' in Canada. A two-horse wagon carried most of our equipment and one canoe, and we got on the wagon to cross Sturgeon river. Mr. Black took the opportunity of examining the bed of the river to see if it was suitable for a railway-bridge. He decided it was, without delaying us. After walking another two miles, we came to Goose river, where we loaded everything into the canoes and sent the wagon back.

On the way up the river we landed and lunched, and then crossed Goose lake, landing on Gooseberry island on the north side at 3:30, when we camped for the night, having a swim in the lake before turning in. The island gets its name from the wild gooseberries growing on it. Starting at 5:45 on the 13th, we paddled most of the day, making several portages. Then we crossed Athapuskow lake, a most beautiful sheet of water with many lovely islands, which look like botanical gardens. The formation in places was limestone, and in other

places schist and quartzite. At 5:30 p.m. we arrived at the Mandy mine on Schist lake, a distance of about 65 miles from The Pas. We camped for the night on the mainland near the island on which the Mandy is situated. At the mine, which is owned by the Tonopah Mining Co., we found Messrs. Graham and Kennedy in

shore of the island. Reynolds went into the bush a short way and pulled up some muskeg, under which he found copper pyrite. Jackson had said to his mate Reynolds when they first went out prospecting, "Now, if we find anything worth while, I want it to be called the Mandy, as it is a name my wife fancies"; so when Reynolds saw

PART OF MANITOBA, SHOWING NEW MINING DISTRICT

charge, and they extended the courtesies that real mining men always offer each other the world over.

The history of the Mandy mine is interesting. A discovery of copper had been made on the mainland, and at the point of the island, claims being staked by the Mosher brothers. Two other prospectors, F. C. Jackson and Sidney Reynolds, later paddled their canoe to the

the copper ore he called out to Jackson, who was still in the canoe, "Well, here's your Mandy for you." The claim was pegged and registered in Jackson's name. He sold it to the Tonopah company for a 15% share in profits on condition that they develop it. Now he denies that Reynolds had any interest, and the case has been heard in court, but no decision has yet been given.

I do not know what the legal position is, but what I do know is this, that when a man goes out prospecting, and discovers something of value, he should benefit by his discovery and it should not be in the power of any man to take this benefit away from him entirely.

The Mandy is a glory-hole out of which 3600 tons of ore has been taken. I understand about 20,000 tons of similar ore has been proved in the lode by diamond-drilling, besides 100,000 tons of disseminated ore that will require concentrating. In any case, there are some millions of dollars to be taken out of this property and I sincerely hope that those benefiting will recognize the moral, if not the legal responsibility to Reynolds, as I am satisfied that his story is substantially true.

A trip in the canoe and a portage on the 14th brought us to Flin Flon lake, on which is situated the large copper, gold, silver, and zinc deposits—now under option to David Fasken of Toronto. Several million tons of ore have been proved already by diamond-drilling. Here we found George Scarfe of Nevada City in charge. The name of Flin Flon was given to this property by one of the discoverers, who had read a book of this name, the hero having found a mine, a hole in the ground, out of which he eventually got untold wealth. The name will probably be changed, as it sounds a little too much like a gay lady robed in a modification of Highland costume, and it is thought that the name, like the costume, is not quite suitable to cover a proposition of such large dimensions. The North-Western Mining & Smelting Co. might be a more suitable name. It is too early to say what place this mine will take in the world; more boring is necessary. All that can be said at present is that it has held up to all that could be expected, and if it answers to its present promise it will be one of the big mines of Canada.

The people of the Province of Manitoba and the Dominion government will no doubt take steps to furnish the necessary transportation facilities. Power also will have to be developed. The new wheat railroad to Port Nelson will benefit if it has back freight from a thriving mining district.

The orebody is about 200 ft. wide; it has been proved by diamond-drill for a distance of 2000 ft. and to 600 ft. deep. The ore is wider southward where the last drill-hole went through it. Drill-holes show about 2% copper and 5% zinc, with \$2.50 in gold and 1½ oz. silver per ton. It is recognized by those directing the enterprise that a larger tonnage of such an ore will have to be proved before it warrants the big expenditure necessary to develop a productive mine.

Having spent a few days at the mine and enjoying the hospitality of Mr. and Mrs. Scarfe and Mr. and Mrs. Jack Callenham, we retraced our steps, carrying the impression that a new and important addition has been made to the mineral resources of Canada.

CAUSTIC-SODA burns should be treated with acetic acid diluted to 2%. Stronger acid must not be used. This may be followed by treatment with carron oil.

## Production of Pyrite

Never before was so much pyrite produced or imported by the United States as in 1916. The increase in production is to be attributed mainly to an increased yield from old mines rather than to the opening up of new deposits. The domestic production was 423,556 long tons, valued at \$1,965,702, which is about 30,000 tons more than was produced in 1915 and was valued at about \$290,000 more than the ore produced in 1915. The total consumption of domestic and imported pyrite amounted to about 1,670,000 long tons. In addition to the pyrite ores returns from acid manufactures show that 577,045 long tons of domestic copper-bearing sulphide ores, 196,404 tons of foreign copper-bearing sulphide ores, 531,625 tons of domestic zinc-sulphide ores, and 92,002 tons of foreign zinc-sulphide ores were treated in the United States in 1916 for their sulphur as well as for their metallic content. Of the pyrite 218,000 long tons, valued at \$1,245,000, came from the Appalachian region, including the States of New York, Virginia, South Carolina, and Georgia; 36,000 tons, valued at \$93,000, came from the region east of the Mississippi, including Pennsylvania, Ohio, Indiana, Illinois, and Tennessee; 23,000 tons, valued at \$60,000, came from Missouri, Wisconsin, and South Dakota; and 145,000 tons, valued at \$565,000, came from California. The quantity of crude pyrite was about four times the amount of concentrate sold, the record showing that 336,000 tons of lump ore, valued at \$1,588,000, and 87,000 tons of concentrate, valued at \$377,000, were produced. The importation of pyritic ores was the greatest in the history of the industry, being 1,244,662 tons, valued at \$6,728,318.

BRICK from ordinary coal ash is one of the newer industries. A company has erected a plant in the East for making fire-brick and building brick from this material. Several thousand of such brick have been made for experimental and test purposes, and they are reported as having proved better than the usual fire-brick in the market. This is said to be due to the fact that coal ash possesses greater heat-resisting qualities than fire-clay. This has been recognized for a long time. It is stated, however, that heretofore brick makers have found it impossible to secure a suitable binder. The new process was invented by Earl V. Wagner, formerly a chemist for two large railroad companies. The new brick is lighter than commercial fire-brick. Last August the oil-fuel combustion chamber of the National Paving Co.'s plant at Milburn, N. J., was lined with the new ash-brick, and they gave three times the service of the brick formerly used, when subjected to a temperature of 3000° Fahrenheit.

SULPHUR in Sicily is sold subject to Government regulation of price. Many grades are produced, from the refined article to material as low as 65%. The refined sulphur is now selling for 46.03 lire per quintal of 220.46 lb., which is equivalent to \$88 per short ton.

# The Synthetic Making of Sodium Cyanide

By G. H. CLEVENGER

\*Early in March, after the appearance of the article by John S. Bucher,† covering his work upon the fixation of nitrogen, I undertook a series of experiments to ascertain whether a synthetic process of cyanide formation employing carbon, a sodium salt, and the nitrogen of the air, together with a suitable catalytic agent, would be of such a nature as to give promise of developing into a commercial method for the production of sodium cyanide. It will be noted that the experiments follow closely those outlined by Bucher, with the exception of my proposal to leach the cyanized briquettes directly with mill-solutions rather than to attempt to produce a refined product.

Briquettes were prepared from the various mixtures according to the method suggested by Bucher. The iron and carbon were ground together for a period of about four hours in a large Abbé jar-mill. The sodium carbonate was then added, and the grinding continued until a thorough mixture resulted. The finely ground and intimately mixed constituents were moistened with hot water, and brought to a stiff paste in a water-jacketed kettle to avoid setting. A small household meat-chopper was remodeled in such a manner that the material fed to it, instead of being ground and torn to pieces, was forced straight out through holes 5/32 in. diameter. This gave briquettes which, when dry, were approximately  $\frac{1}{8}$  in. to 1 in. long, depending upon how they broke during handling. These were placed in shallow layers in iron pans, and dried on a hot-plate. The furnace used for heating the iron pipe containing the briquettes consisted of rings of arch fire-brick held together by hoops of heavy iron wire. Two gasoline burners supplied the necessary heat. The temperature of the briquettes was determined in the first experiments by means of a Le Chatelier thermocouple and a Siemens Halske millivoltmeter, but later it was found more satisfactory to use a Féry radiation-pyrometer, for the reason that the wires of the couple were rapidly destroyed by vapors which penetrated the iron protecting-tube, and, moreover, it was found to be rather difficult to introduce the couple into the charge in a satisfactory manner. In the first experiment an attempt was made to use a 4-in. gas-pipe, but in the later experiments it proved more convenient, on account of the small quantity of briquettes available, and the slow rate of heat-penetration with the larger pipe, to use 6-ft. lengths of 1½-in. pipe.

Producer-gas was used throughout the tests as a source of nitrogen. This was made by blowing a carefully regulated blast of air through incandescent wood-charcoal

contained in a 6-ft. upright section of 4-in. gas-pipe. The pipe was arranged with a grate at the bottom for supporting the charcoal, and a large removable plug at the top for charging and cleaning. This small producer worked satisfactorily throughout all the tests, except in the first experiment, when some difficulty was experienced on account of an attempt to use coke instead of charcoal. It was found difficult to keep the coke burning in this small apparatus, and ashes and clinker interfered also, whereas with the charcoal the light ash formed could be blown off readily at intervals by opening the large plug at the top of the pipe. The body of the pipe was jacketed by slipping over it a section of 10-in. light sheet-iron pipe, the annular space between the two pipes being filled with sand. The general arrangement of the producer and the cyaniding furnace is shown in the accompanying drawing. In making a run the briquettes were charged into a length of the 1½-in. gas-pipe, which had previously been fitted at the bottom with a perforated supporting-disc. After the furnace had reached the proper temperature this was screwed into position so as to make a connection with the producer. After allowing sufficient time for the pipe and the contained briquettes to reach the proper temperature, the gas from the producer was turned on and the cyanizing continued for the period stated in each experiment. Upon the conclusion of each test the pipe was unscrewed, lifted from the furnace, and closed at both ends by means of caps which prevented the entrance of air. The contents were not discharged from the pipe until cold.

EXPERIMENT 1. Briquettes consisting of two parts coke, two parts iron-filings, and one part sodium carbonate were charged into a 5-ft. section of 4-in. pipe. This was placed in the furnace and heated to the temperature recorded in the accompanying log. When this experiment was made the difficulties of operating the small gas-producer had not been overcome, so that a 2-ft. column of coarsely crushed coke was placed at the bottom of the pipe, and air was passed through the charge instead of producer-gas. The briquettes were separated from the coke by means of an iron screen.

Time	Temperature, degrees C.	Remarks
1:00		Started burners.
2:00	600	Bottom of pipe red. Added a 2-ft. column of coke.
2:15	650	Added a 1½-ft. column of briquettes.
2:40	500	Increased heat.
2:50	600	Upper 2 ft. of pipe dull red. CO flame at mouth of pipe.
3:03	740	Slow stream of air passed through. CO flame increased.

\*Published by permission of the Director of the Bureau of Mines.

†Jour. Ind. & Eng. Chem., March 1917.

Time	Temperature, degrees C.	Remarks
3:20	860	CO flame at mouth of pipe showing more sodium at temperature increases.
3:30	900	
3:40	950	
3:50		Air line out.
4:00	1920	
4:15	1030	

Upon the conclusion of the experiment it was found that the bottom of the pipe had melted, due to the intense heat produced by the combined effect of the burners and the combustion of the coke inside the pipe. The briquettes contained in the tube were sampled, and titrations for cyanide were made upon samples as below:

Sample	NaCN in equivalent of KCN,† per cent
1 (top) .....	0.15
3 (middle) .....	0.45
5 (bottom) .....	0.41

†Throughout this article cyanide percentages are expressed in terms of potassium cyanide. The actual percentage of sodium cyanide present in any particular case would be lower, and may be calculated by dividing the figure given by 132.8%.

**EXPERIMENT 2.** In this an attempt was made to heat a section of the 1½-in. pipe electrically, but despite the fact that it was insulated on the outside by pulverized fire-brick, it was impossible to raise the temperature, with the current available, above a maximum of about 650°. However, producer-gas was passed through the pipe containing a charge of briquettes of similar composition to those used in experiment 1, but careful analysis of samples taken from various parts of the charge failed to show any cyanide. Failure to form cyanide was doubtless due to the low temperature.

**EXPERIMENT 3.** 950 grammes of briquettes of the same composition as used in experiment 1 was charged into a 1½-in. pipe. When the charge had reached about 900°C. a slow stream of producer-gas was passed through, and was maintained for 20 minutes after the charge had reached a temperature of 1060°. The total time of passing gas through the charge was approximately one hour. As soon as the gas was turned off the thermo-couple was removed. The pipe was taken from the furnace and allowed to cool. While it was cooling, the air had access to the pipe, as the opening of the thermo-couple was not closed. A small amount of water inadvertently found its way into the pipe, causing some decomposition. Titrations for cyanide upon three samples taken from various parts of the mass were made; the results are given below:

Sample	NaCN in equivalent of KCN, per cent
1 (top) .....	0.5
3 (middle) .....	9.5
5 (bottom) .....	0.075

**EXPERIMENT 4.** 950 grammes of the same briquettes as those used in experiment 1 was charged into a 1½-in. pipe. The temperatures throughout the test were as follows:

Time	Temperature, degrees C.	Remarks
1:15		Started burners.
2:00	900	Briquettes added, 950 gm.
2:30	920	
2:50	1020	Producer-gas turned on.
3:10	1070	
3:30	1090	
4:00	1100	
4:25	1100	Producer-gas turned off.

Upon conclusion of the test the pipe was removed and immediately capped and allowed to cool in the air. Samples were taken at various points in the charge and were found to contain the percentages of cyanide noted below:

Sample	NaCN in equivalent of KCN, per cent
1 (top) .....	10.2
2 (next to top) .....	18.5
3 (middle) .....	5.3
4 (next to bottom) .....	trace
5 (bottom) .....	trace

**EXPERIMENT 5.** 1772 grammes of briquettes was charged into a 1½-in. pipe which was placed in position after heating the furnace to 1000°C. During this test the gas issuing from the tube containing the briquettes was passed through a 0.3% solution of sodium hydroxide in order to determine whether there was any volatilization of cyanide.

Time	Temperature, degrees C.	Remarks
10:15		Pipe placed in position and burners started.
10:45	1020	
11:00	950	Producer-gas turned on.
11:20	1030	
11:30	1040	
11:45	1050	
12:00	1090	Producer-gas turned off.

Upon completion of the test the pipe was removed from the furnace, capped at both ends, and allowed to cool to room temperature. Titrations for cyanide were run upon samples from various parts of the charge (samples 1-5) and also upon a general sample (6) divided from a mixture of the whole charge.

Sample	NaCN in equivalent of KCN, per cent
1 (top) .....	0.075
2 (next to top) .....	4.1
3 (middle) .....	16.9
4 (next to bottom) .....	5.1
4 (bottom) .....	0.11
6 (general) .....	4.2

The total weight of the briquettes after treatment was 1500 gm. No cyanide could be detected in the sodium-hydroxide solution through which the exit-gas bubbled. This would indicate that the loss of cyanide by volatilization under the conditions of this experiment was negligible.

**EXPERIMENT 6.** Briquettes composed of two parts coke, two parts roll-scale, and one part sodium carbonate were used in this test. The original weight of the briquettes as charged into the 1½-in. iron pipe was 1520

gm. In drying the briquettes containing roll-scale it was noted that even when the pan in which the briquettes were placed to dry did not rest directly upon the hot-plate, but upon a thick sheet of asbestos, and when every precaution had been taken to dry at a low heat, the briquettes would suddenly become red hot and glow for some time as the drying progressed. The black color of the original briquette was then transformed to brown. Although considerable care was exercised in drying the briquettes containing iron oxide, this difficulty was not entirely overcome. The exit-gas was

In this test the sodium-hydroxide solution through which the exit-gas bubbled showed a trace of cyanide, which indicated that there had been slight volatilization of cyanide. The weight of the briquettes upon completion of the experiment was 1000 grammes.

EXPERIMENT 7. Briquettes were made up from two parts of sage-brush charcoal, two parts iron filings, and one part sodium carbonate; 975 gm. of these which were somewhat bulkier than those previously used being charged into a section of 1½-in. pipe. After the furnace had reached a temperature of 1000°C., the pipe was in-

APPARATUS FOR MAKING SODIUM CYANIDE

passed through a 0.3% solution of caustic soda, as in the previous tests.

Time	Temperature, degrees C.	Remarks
1:30		Pipe placed in position and burners turned on.
2:00	950	
2:05	1020	Producer-gas turned on.
2:20	1040	
2:40	1070	
3:05	1080	Producer-gas turned off.

Upon shutting off the producer-gas, the pipe was immediately removed from the furnace, capped, and allowed to cool to the room temperature. Cyanide was found in the various samples of briquettes as indicated:

Sample	NaCN in equivalent of KCN, per cent
1 (top) .....	7.8
2 (next to top) .....	19.7
3 (middle) .....	6.4
4 (next to bottom) .....	0.03
5 (bottom) .....	0.035
6 (general) .....	5.4

produced, and producer-gas passed through. The temperature at various stages of the test was as below:

Time	Temperature, degrees C.	Remarks
3:10		Pipe placed in position and burners turned on.
3:35	1020	
4:00	1070	
4:20	1070	
4:35	1050	Producer-gas turned off.

Upon conclusion of the test the pipe was removed, capped, and allowed to cool to the room temperature. Various sections of the charge showed cyanide as indicated below:

Sample	NaCN in equivalent of KCN, per cent
1 (top) .....	0.05
2 (next to top) .....	1.45
3 (middle) .....	6.60
4 (next to bottom) .....	3.70
5 (bottom) .....	0.12
6 (general) .....	4.3

No cyanide was found in the caustic-soda solution

through which the exit-gas bubbled. The briquettes in the bottom portion of the charge did not disintegrate and fall into powder, as was the case in the other experiments. The weight of the briquettes at the end of the experiment was 768 grammes.

EXPERIMENT 8. Briquettes were made from two parts coke, two parts Swedish iron ore (magnetite), and one part sodium carbonate. The weight of the briquettes which was charged into the 1½-in. pipe was 1208 gm. In this test the thermo-couple was damaged, so the temperature readings were low, and as a consequence the bottom portion of the pipe became overheated and melted through at one point. Producer-gas was passed through the tube for a period of one hour.

Sample	NaCN in equivalent of KCN, per cent
1 (top) .....	12.2
2 (next to top) .....	8.2
3 (middle) .....	0.3
4 (next to bottom) .....	trace
5 (bottom) .....	0.4
6 (general) .....	4.6

A trace of cyanide was found in the caustic-soda solution through which the exit-gas bubbled, indicating slight volatilization of the cyanide. The weight of the briquettes after treatment was 923 grammes.

EXPERIMENT 9. Briquettes were prepared consisting of two parts of oak-charcoal, two parts roll-scale, and one part sodium carbonate, 1585 gm. of these briquettes being charged into the 1½-in. pipe. Producer-gas was passed through the charge for a period of one hour. Temperatures as given below were determined by the Féry pyrometer:

Time	Temperature, degrees C.	Remarks
1:20		Pipe placed in position and burners turned on.
2:20	1040	Producer-gas turned on.
2:40	1050	
3:20	1070	Producer-gas turned off.

On completion of the test the pipe was removed from the furnace, immediately capped, and allowed to cool. Over one-third of the charge at the bottom of the tube was found in a pulverulent condition. Cyanide determinations were made upon various samples, as recorded below:

Sample	NaCN in equivalent of KCN, per cent
1 (top) .....	trace
2 (next to top) .....	13.0
3 (middle) .....	21.4
4 (next to bottom) .....	0.12
5 (bottom) .....	0.68
6 (general) .....	9.50

The weight of briquettes after treatment was 1089 gm. No cyanide was found in the caustic-soda solution through which the waste-gas bubbled.

EXPERIMENT 10. Briquettes similar to those used in the earlier tests, namely, coke, iron filings, and sodium carbonate, amounting to 1700 gm., were charged into the 1½-in. pipe. Arrangement was made in this case for passing the producer-gas through an emulsion of lime, with the idea of removing such CO<sub>2</sub> as still remained in the gas. The temperatures of the containing pipe as indicated by the Féry pyrometer were given below:

Time	Temperature, degrees C.	Remarks
4:30		Pipe placed in position and burners turned on.
5:10	970	Producer-gas turned on.
5:40	1030	
6:10	1070	Producer-gas turned off.

The total time of passing producer-gas was one hour. Cyanide determinations as tabulated below were made upon samples taken from various parts of the charge:

Sample	NaCN in equivalent of KCN, per cent
1 (top) .....	0.10
2 (next to top) .....	13.60
3 (middle) .....	28.30
4 (next to bottom) .....	1.70
5 (bottom) .....	trace
6 (general) .....	10.40

The total weight of briquettes after treatment was 1007 gm. A small portion of the charge at the bottom of the tube was unavoidably lost in removing the pipe from the furnace. No cyanide was found in the caustic-soda solution through which the exit-gas bubbled.

The highest maximum cyanide-yield was realized in this test, and a much higher total yield was obtained than in the preceding tests where the conditions were the same except for the removal of the carbon-dioxide from the producer-gas. This test would seem to indicate that complete removal of the carbon-dioxide is advantageous. However, it is possible that the small amount of water-vapor absorbed by the producer-gas in passing through the lime-emulsion is also advantageous. The opinions expressed in 'The Cyanide Industry' by Robine, Lenglen, and Le Clere, appear to differ upon this point, some investigators claiming that a small amount of water-vapor is advantageous, while others claim that it is disastrous. Further experiments will be necessary to settle this point.

TREATMENT OF GOLD AND SILVER ORES. The question at once arose as to whether the cyanide leached directly from the briquettes could be utilized for the economic

extraction of gold and silver in the well-known cyanide-process. In order to determine this point, the tests described below were made upon ores of different types. A small lot of briquettes was leached with tap-water and the strong-solution thus produced was diluted with water to produce a working-solution containing 0.123% of cyanide in terms of potassium cyanide. Agitation-tests employing this solution were made upon two samples of a Nevada gold-silver ore. The tabulation above shows the results obtained, together with the extraction previously made from the same samples when employing a solution of commercial cyanide such as is ordinarily used in the treatment of gold and silver ores.

The silver extraction with the briquette-solution is lower, particularly with sample B. The average extraction of gold is slightly lower, but the difference could easily have arisen in the tests, as each series was made independently by different men. In this case no attempt was made to purify the briquette-solution before applying it to the ore. Qualitative tests had indicated the presence of sulpho-cyanate, ferro-cyanide, and alkaline sulphides in the briquettes, but there was considerable variation in the proportion of these impurities present in the different samples. The lower silver extraction obtained in this series of tests with the briquette-solution may have been due to the presence of a small amount of alkaline sulphide, since no effort was made to remove it from the solution prior to use. In order to more thoroughly test the briquette-solution for ore-treatment a portion of the briquettes from Test 9 was leached with tap-water and the resulting solution diluted with water to a working-strength of 0.101% cyanide in terms of potassium cyanide. This solution was found to contain a small amount of ferro-cyanide and only traces of sulpho-cyanate and alkaline sulphides. A few drops of lead acetate was added to assure the absence of alkaline sulphides, and lime was used to give a protective alkalinity of 47 points. A solution was also prepared from commercial sodium cyanide, such as is commonly used in the

treatment of gold and silver ores, containing 0.1005% cyanide in terms of potassium cyanide. This solution was similarly treated with a few drops of lead-acetate solution, and with lime to give a protective alkalinity of 51 points. The aim was to have both solutions in as nearly the same condition as possible. Parallel tests were made, as noted below, on three different types of ore, the only difference, within commercial limits, being the source of the cyanide used. A silver ore from the Presidio district in Texas, assaying 23.18 oz. silver per ton and but a trace of gold, was ground to pass a 100-mesh screen, and samples were treated with both solutions by agitation for periods of 24 and 48 hr. Lime of a very low grade, containing only 38.6% CaO, was added at the rate of 15 lb. per ton.

A silver-gold ore from Virginia City, Nevada, assaying silver 7.72 oz. and gold 0.50 oz. per ton, was then ground to pass a 100-mesh screen and was given the same treatment as in the case of the Presidio samples, the same grade of lime being used as in the former test.

Next a gold-silver ore from the Jarbidge district of Nevada, assaying silver 2.08 oz. and gold 1.65 oz. per ton, was ground to pass a 65-mesh screen and was treated similarly to the Presidio samples, the same lime, in the proportion as before, being added.

With the exception of the silver in the Ophir ore the results upon the two solutions check within the ordinary limits of experimental error. However, in this case the difference might have arisen through irregularity in the sample or through an error in assaying. On the whole it would appear from these small-scale tests that the synthetic cyanide is about as effective for the treatment of gold and silver ores as the commercial cyanide ordinarily used. Nevertheless, cyclic tests should be made, covering a considerable period of time, in order to determine whether harmful impurities would accumulate in the solution. A tentative flow-sheet is offered that shows how the proposed synthetic method of cyanide-formation might be made to fit into the operation of a cyanide-

plant. Inasmuch as the cyanide solutions employed in cyanidation are very dilute, and as the increase in the strength of cyanide necessary at the end of each cycle to restore the original working-strength of the solutions is small, the conditions for applying the idea are considered to be favorable. Although the final cyanide-product is of a low grade, the fact that the bulk of impurities (carbon and iron) are comparatively insoluble renders it possible to introduce, through the suggested method, high-grade cyanide into the mill-solution in a very simple manner. It would appear that the formation of sulpho-cyanates and soluble sulphides could be avoided by using raw material free from sulphur. Traces of soluble sulphides, when they do occur, can readily be removed by the use of a lead salt. Excessive formation of ferro-cyanide apparently could be avoided by rapid leaching of the freshly cyanized product. The presence of ferro-cyanide would invariably be expected when using iron as a catalytic agent, but it is not anticipated that the concentration of the mill-solutions in the presence of the zinc would increase to the point where it would cause trouble.

As indicated in the flow-sheet it is proposed to use a portion of the barren solution for dissolving the cyanide from the briquettes, thus giving a strong solution with which to bring up the strength of the whole mill-solution. The barren solution is used rather than a solution containing the precious metals in order to avoid premature precipitation of the gold and silver by the finely divided iron and carbon in the briquettes. The spent cake would be returned to the mixer, where, after adding carbon, and as much of the catalytic agent as might be necessary, together with a sodium salt, it would be converted into fresh briquettes which, after being dried and having had producer-gas passed through them, would again be leached. The reagents required would therefore be carbon, sodium carbonate, nitrogen from the air, and replacement of so much of the catalytic agent as might be necessary to replace the losses. The proposal to leach the cyanized briquettes with mill-solution avoids the difficulty of recovering alkaline cyanides in the solid purified form, which, according to Williams,\* has proved a stumbling block with many processes of cyanide manufacture, particularly those in which atmospheric nitrogen has been used.

The most vital point in the application of the process is the furnace in which the combination of the elements to form cyanide is effected. It is assumed that in heat-

ing the charge it would be necessary to keep it out of contact with the products of combustion. It therefore becomes necessary, unless electric heating be used, to put the charge in a metallic container of refractory material, heated from the outside. The difficulties arising from the use of refractory material for this purpose would be those of cracking, of slagging with substances in the charge, and of slow transfer of heat. On the

FLOW-SHEET FOR MAKING SODIUM CYANIDE IN CONJUNCTION WITH MILLING

other hand, metallic containers are open to the objection that they might be subject to rapid destruction through oxidation and burning from the outside at the temperature necessary to bring about the reaction. The rate of heat-penetration into a charge of this kind is slow; therefore, if the time-factor is to be kept down to a reasonable limit, and the overheating of the containing tubes is to be avoided, it would be necessary to use a container of comparatively small section. So far as we know, this should be made preferably of iron. Increased capacity of the individual unit could be obtained by making the tube elliptical in form, and a sufficient number of these units could be mounted in a suitable furnace to give the desired capacity. They should be interchangeable and removable, so that when they failed they could readily be

\*'The Chemistry of Cyanogen Compounds and their Manufacture and Estimation.' Blakiston's Son & Co. (1915), p. 302.

taken out and replaced. In the experiments cited the iron pipes rapidly oxidized during cooling, forming a thick layer of scale, a pipe rarely lasting longer than three tests. It is claimed by the inventor, however, that if the containers are not allowed to cool, and particularly if the furnace gases are maintained at a reducing composition, and furthermore if the cyanized briquettes are discharged as fast as formed, into special receptacles for cooling, the life of the container is greatly prolonged. When electrical heating is adopted it would appear possible to surround the outside of the containers and heating-elements with a reducing-gas or nitrogen. Assuming that a product containing 10% of cyanide is formed (which I have by no means definitely proved to be possible in continuous commercial operation), and that the furnace is properly designed, this method of cyanide formation would appear to be feasible, even though the loss of containers be high, particularly under conditions of high cost of cyanide, such as have obtained for some months.

Attention is called to the fact that a small fund only and a very brief time were available for making these tests. Therefore, in the absence of complete data, my discussion of the subject and of the conclusions reached must be looked upon as being of a purely tentative character. I am informed, however, that the Nitrogen Products Co., the owners of the Bucher patents, is rapidly placing the process upon a commercial basis for the production of high-grade sodium cyanide.

Largest Ingot Mold Ever Made

The largest ingot mold ever made has just been poured by the Bethlehem Steel Co. at South Bethlehem, Pennsylvania. Its dimensions are 15 ft. 7 in. high, with a mean diameter of 91½ in., its shape being octagonal and corrugated. At its thinnest section or point of corrugation the thickness of the metal is 15 in., and the heaviest section is 20¾ in. A mold of this size is made so that steel can be poured into it to form ingots large enough to be reconverted into 16-in. and 18-in. guns. A steel ingot poured in this mold will weigh 300,000 lb., and from it tubes and jackets for the large guns will be forged. Before the mold can be used large steel bands, 12 in. wide, must be shrunk around each end of the casting after it has cooled. Because of the necessity of pouring this large mold quickly bessemer pig-iron was melted in three large open-hearth steel furnaces and the melted iron suspended in ladles over the mold at one time. A continuous runner from the ladles was made so that the iron was thoroughly mixed before entering the mold. It took 340,000 lb. of pig-iron to pour the casting, not counting the 10,000 lb. needed later to fill up the sink-heads so as to take care of the natural shrinkage. The mold had to be left covered in the sand for a considerable time to completely cool. Two large 100-ton cranes were used to lift it from its pit and prepare it for transference to the open-hearth department where it will be used regularly for casting ingots.

Non-Ferrous Metal Exports

Exports of non-ferrous metals for June were \$59,918,-666, against \$64,148,723 in June 1916, a decrease of \$4,230,057, or 7%. Exports for 12 months totaled \$820,818,850, \$414,033,182 in 1916, and \$164,747,501 in 1915. The average rate of export on the basis of 12 months ended June 30 has been more than four times the corresponding figures for 1915, which was a representative period just before the war movement started on a large scale.

The following gives totals for the six metals:

	1917	1916
Copper and manufactures	\$30,860,643	\$24,379,526
Brass "	21,565,239	31,929,451
Zinc "	3,602,070	5,161,552
Lead "	1,859,031	1,301,128
Alum. "	1,278,043	488,007
Nickel "	753,640	889,059
June total	\$59,918,666	\$64,148,723

Exports of the copper group in 1917 increased in value 223% compared with corresponding figures for 1915. Exports of zinc and zinc manufactures were three times greater than those of 1915 and aluminum and manufactures in 1917 were nearly six times those of 1915. Comparative statistics of the exports of the six principal non-ferrous metals for the 12 months show:

	1917	1916	1915
Copper and manufactures	\$322,284,174	\$173,946,226	\$99,558,030
Brass "	383,291,964	164,876,044	20,544,559
Zinc "	66,108,586	45,867,156	21,243,935
Lead "	16,563,290	13,823,004	9,004,479
Alum. "	20,299,982	5,664,349	3,245,799
Nickel "	12,270,854	9,876,403	11,110,699
Total, 12 months	\$820,818,850	\$414,033,182	\$164,747,501

PAINT can be removed from iron and steel surfaces by the following process as employed by the U. S. Coast Artillery Corps which employs it to clean the exterior surfaces of big guns and carriages. One pound of concentrated powdered lye is dissolved in six pints of hot water, and lime is added to make the solution thick enough to spread. It is then applied, freshly mixed, with a brush, and allowed to remain until almost dry. When it is stripped off it will take the paint with it. In case the paint is thick and old it may be necessary to wash the surface and apply a second coat of the emulsion. After the old paint has been entirely removed and before a new coat of paint is applied, the metal should be washed with a solution consisting of one-half pound washing soda, or sal soda, dissolved in eight quarts of water, after which, of course, the parts should be thoroughly dried.

IMPORTATIONS of sulphur in 1916 were practically the same as for the last five years, amounting to 22,235 long tons, valued at \$404,784. The exports, however, increased nearly 350% over the exports in 1915, amounting to 128,755 long tons, valued at \$2,505,857.

## A Simple Head-Frame

At small mines it is usually necessary to equip and operate at the least possible expense, as there generally is little money available to be wasted in unnecessary equipment or in doing work that has not some direct and immediate value. Among the structures that small mines most commonly require is a head-frame designed to meet all requirements, and one that may be made of a minimum amount of timber, easy to construct, and therefore inexpensive. As the shafts of most new mines and prospects are sunk on the vein, and as the vein is seldom

SELF-DUMPING HEAD-FRAME

vertical, inclined shafts are more common than those that are vertical.

The accompanying illustration is that of a head-frame designed for a small mine, having an inclined shaft. Usually miners select timbers for head-frame construction that are much heavier than necessary. It is a very common thing to see a head-frame not more than 30 or 35 ft. high, built of 12 by 12-in. timbers, when the greatest stress it will ever be called upon to meet will be, perhaps, weight of a skip or bucket, loaded with rock or ore, with perhaps two or three men, the whole weighing less than 3000 lb. A properly constructed head-frame of 8 by 8-in. timbers will be strong enough for this load with a large factor for safety, if properly designed and built. The structure here illustrated is composed of as few pieces of timber as possible to meet the necessities of the work, which requires provision for an ore-bin in the frame and a dump for both ore or rock, and one for water. The water-dump is arranged just above the collar of the shaft, as shown, where a segment of the track on either side is provided with hinges and forms a gate which may be swung back, when it is desired to dump water or tools from the skip.

When the skip comes up loaded with ore the top-man closes the gates and the skip descends into the shaft at the pleasure of the engineer.

The skip is of the ordinary pattern, without special arrangement of extra wheels, or other dumping device. When the skip arrives at either the lower or the upper dump, the forward wheels follow the curve in the track and run out horizontally. The engineer continues to hoist, taking care not to overwind, and as the lower part of the skip is lifted by the draw-bar, it is tilted forward and the load dumps automatically. As soon as the engineer releases the brake the rear wheels of the skip again drop onto the track and the skip runs down the shaft. The whole thing works automatically, and one man at the engine may do all the top-work when necessary. Not only is this device inexpensive and simple in operation, but it has been demonstrated to be perfectly safe at many mines in California.

The accompanying drawing is incomplete as it is intended merely as a suggestion, for the reason that each superintendent has his own ideas about the construction of ore-bins and other structures about his mine. However, the ore-bin may be secured to the main timbers of the head-frame, or it may be provided with individual posts to support it.

This frame is pyramidal in shape, the main members tapering, and meeting at the apex, where the sheave-bearings are placed, the sheave itself running between the right and left-hand sides of the structure. If for any reason a rectangular frame is preferred it must be made somewhat higher than here shown and then the sheave rests in boxes secured to two upright timbers, that are mortised into the cap and into a tie placed about three feet below the cap. This will give the necessary clearance for dumping the skip in the upper bin.

THE EXPECTED has happened in the spelter industry. Confronted with operating at a loss, a number of zinc plants have closed and still others have inaugurated drastic curtailment. At the mid-year 14 zinc plants had become idle, their capacity being 35,000 retorts, with a probable yield of about 120,000 tons of spelter per annum. Both the Caney and Deering smelters of the American Zinc, Lead & Smelting Co. have closed. These have a combined capacity of about 38,000 tons of spelter per year. It is understood that one of the Granby smelters, also controlled by American Zinc, will close shortly. Other smelters have curtailed heavily and one plant, controlled by one of the largest factors, has shut down. On June 30 there had accumulated 35,000 tons, according to the Government compilation. Producers believe that, despite the growing curtailment since that time, unsold stocks have been piling up. Domestic demand has fallen flat; Government requirements by no means call for today's production and the export movement has subsided materially.

# Chemicals Used in Flotation

By O. C. RALSTON and L. D. YUNDT

**INTRODUCTION.** \*The development of the flotation process in a few years to a stage where over 100,000 tons of ore is treated every day in the United States, and half as much more in the rest of the world, threatened, for a time, to upset the market for various products such as pine-oil, coal-cresote, and coal-tar. Incidentally, flotation has also opened a market for other chemicals that formerly could not be used in the Western inter-mountain districts.

**ACIDS.** Almost the only acid used for flotation work is sulphuric, which costs less than most of the other acids. No one knows why the addition of sulphuric acid to certain pulps improves the flotation. We do know that it often produces a froth containing less gangue, and also that higher recoveries are made. Further, it can reduce the amount of oil necessary to produce the same frothing effect. However, the addition of acid to an ore-pulp sometimes proves fatal to good flotation, especially with copper ores in which a part of the copper has been oxidized by weathering, as at Inspiration, Arizona. The trouble may be due to the formation of copper sulphate. The oxidized copper minerals dissolve easily in dilute sulphuric acid solutions, whereas the natural copper sulphides are not attacked.

When the addition of sulphuric acid causes an improvement in the flotation of a particular ore, its exact function is difficult to explain, and theories are conflicting. The Potter-Delprat process depended on acid to develop bubbles of gas through reaction with carbonate minerals (such as calcite) in order to form a froth, and bubbles of air were not beaten into the pulp. Consequently it was natural that some of the early theorists claimed that the addition of acid caused an increased number of gas bubbles to form in the pulp and so facilitated the flotation of all the desired mineral. The fallacy of this argument has long been recognized.

Fanciful electro-static theories have been advanced to explain flotation and the statement has been made by one theorist that the addition of an electrolyte to the water of the pulp allowed the electro-static charges on the gangue-particles to be conducted away while the charges on the particles of the desired minerals were insulated by a surrounding film of oil. This theory was soon exploded, as it rested on a misapprehension as to just what caused charges to appear on suspended particles. The surfaces of small particles suspended in a liquid usually tend to adsorb more ions of one electric sign than of the other sign and hence carry apparent

electro-static charges. The thing to be noted, however, is that these charges on the particles are not conducted away in the presence of electrolytes, but their existence is dependent upon the presence of ions in the solution. The surface of oil droplets and of air bubbles likewise adsorb ions from solutions, and a certain parallelism between the charges on these various particles of matter and the conditions of good flotation has been observed. Just what is the inner connection has never been explained. It is an interesting fact that one mill in Colorado was reported to receive pure water from melting snow and that flotation of its ore in this water was unsatisfactory until the water was contaminated with an electrolyte, sulphuric acid proving acceptable among other things.

Bancroft<sup>1</sup> calls attention to the fact that the acid may not react because of the replaceable hydrogen atom but by cutting down the concentration and consequently the adsorption of the hydroxyl ions. The connection that he wishes to draw is that "in acid and neutral solutions air seems to be adsorbed by organic liquids much more readily than by water," and he thus derives a reason for the attachment of the air bubbles to the oiled sulphides. The preferential adhesion of the oil to the valuable sulphide minerals in the presence of gangue-minerals is well known.

The surface-tension theorizers have claimed that the addition of the proper electrolytes, like sulphuric acid, so alters the surface-tension of the water that frothing can take place. This may be true without conflicting with the colloidal theory, but we would call attention to the small amounts of acid that produce a marked effect on flotation and the small resulting changes in surface-tension of the water. Small amounts of electrolytes are sometimes known to produce profound changes in colloids and we feel more inclined to favor the colloidal theory.

Nevertheless it is not right to claim that the replaceable hydrogen atom has nothing to do with the improvement in flotation results when acid is added. Allen and Ralston<sup>2</sup> have called attention to the fact that if any sample of ore is ground dry it is usually necessary to use acid in the flotation, whereas it is often possible to grind this same ore in a wet condition in a pebble-mill and obtain the same flotation results without the use of acid. The natural inference is that the dry grinding has caused oxidized films to form on some of the particles of natural sulphides and that the sulphuric acid was needed

\*A paper read before the American Chemical Society, at New York, September 1917.

<sup>1</sup>Wilder D. Bancroft: 'Ore Flotation', 'Met. & Chem. Eng.' Vol. XIV, p. 631 (1916).

<sup>2</sup>M. & S. P., January 1 and January 8, 1916.

to dissolve these films, leaving a clean unaltered surface for the action of the oil and the bubbles. This, of course, is a special case and does not make any exception to the colloidal theory.

The amount of acid used is usually the minimum that will produce a given effect. It varies from two or three pounds of sulphuric acid per ton of ore (mixed with three to five tons of water), to as high as one or two hundred pounds of acid. When a large excess of acid is necessary we feel that it must be dissolving off oxidized films, while small amounts of acid are probably effective in causing selective-adsorption effects. Acid seems to be necessary in the flotation of sphalerite and iron pyrite. Occasionally a pyritic copper ore needs acid. The Anaconda slime constitutes an example. The present tendency among flotation men is to find substitutes for acid.

**COPPER SULPHATE.** So much has been said about the "flotation mystery" involved in the improved results obtained at the Mascot, Tennessee, plant of the American Zinc, Lead & Smelting Co., that a word should be said here. There is no doubt that the use of less than one pound of copper sulphate per ton of ore, suspended in over four tons of water, has caused much higher recoveries of the sphalerite in their ore and allowed cleaner work. The same effect has been noticed in many other mills treating zinc-sulphide ores, although an improvement in the flotation is not necessarily the invariable result of adding copper sulphate to zinc-sulphide ores.

At Mascot, the large-scale plant was unable to reproduce the results obtained in the laboratory. At last it was realized that the bronze castings used in the laboratory machine might account for the difference, and the hanging of a plate of copper in the mill-pulp while it was passing through the large flotation machines corrected the difficulty, and led to the discovery of the effect of salts of copper on the flotation of sphalerite.

Copper sulphate is deleterious in the flotation of silver ores<sup>3</sup> and of copper ores, its effects being overcome by precipitation with such a reagent as hydrogen sulphide, sodium sulphide, or sodium carbonate. Neither silver minerals nor copper minerals precipitate copper ions from solutions, but it is known that natural zinc sulphide reacts with copper-sulphate solutions, precipitating copper sulphide; in fact, this reaction is used in the Huff electro-static separation process for separating zinc sulphide from minerals of the same specific gravity and likewise poor conductors, such as barite. By soaking the mixture of minerals in a dilute copper-sulphate solution a thin imperceptible film of copper sulphide is formed over the zinc-sulphide particles, and when dry these act like good conductors and can be caused to jump off the electro-static machines, leaving the barite behind.

The suggestion is inevitable that in the case of improved flotation of sphalerite the copper going into solution is precipitated as copper sulphide on the surface of the zinc-sulphide particles, making them capable of bet-

ter flotation. Why the modified particles float better is the real mystery. Whether the increased electric conductivity of the surfaces of the particles has anything to do with it, or whether copper sulphide has some inherent property of being more easily 'oiled,' is hard to say.

Some other effects not previously recorded have been reported to me by F. G. Moses, one of the engineers of the General Engineering Co. He had observed the appearance of the tailing from the flotation machines treating a sphalerite ore, when it was passed over a slime-table (as a pilot to indicate the work of the flotation machine by the size of the concentrate streak produced). Before the addition of copper sulphate the slime in the tailing seemed impalpable, but afterward it had the appearance of curdled milk (flocculated). However, in a second mill the slime in the tailing still seemed to be deflocculated. In both instances the finely ground zinc sulphide in the concentrate seemed to be flocculated and in the second case the grade of the concentrate was raised considerably by passing it through a drag-classifier from which some of the deflocculated gangue-slime could overflow. This observation may prove important. I have often noticed the flocculated condition of the concentrate in flotation-froths but had attributed it to the oil that supposedly collected the material into little flocks. Evidently the copper sulphate could assist in this flocculation, for it is well known that heavy metal ions are strongly adsorbed. In colloid chemistry it is usual to find small amounts of such chemicals producing striking effects and it is probable that the extremely small amounts of copper sulphate involved in the case under discussion are sufficient only for some colloidal reaction, be that what it may.

The condition of the concentrate and gangue particles, with regard to their degree of flocculation, has not been sufficiently investigated; hence we are confronted with the necessity for determining just what becomes of the copper introduced into such ore-pulps. Is it precipitated as copper sulphide or is it adsorbed?

**LIME AND ALKALIES.** Of late there has been a tendency to use various alkalies as addition-agents in flotation, with the result that in many places they are competitors of acid. Of course, the best thing to do, if possible, is to find an oil mixture that will not call for any addition-agent, but as long as the use of these further addition-agents increases the extraction of the desired mineral or improves the grade of the concentrate enough to more than pay for the amount of addition-agents used, they will not be displaced. The use of alkaline addition-agents has advantages in lessening the corrosion of the machinery, and often diminishes the amount of oil necessary. With alkaline pulp the oils can be added to the pulp ahead of the final grinding machinery so that the tubes or ball-mills can be caused to disseminate the flotation-oil before the pulp reaches the flotation machinery.

Few people have reported any observations on the phenomena produced by the use of these addition-agents,

<sup>3</sup>M. & S. P., December 18, 1915. 'Effects of Soluble Compounds of Ore on Flotation.'

beyond the improvement of the metallurgical results. There is no doubt that soluble heavy-metal salts are precipitated by the use of these various alkaline substances and it is also well known that these soluble metal compounds are often deleterious to flotation, so that their removal by precipitation is imperative. It is also known that in a number of instances it has been possible to float a 'tarnished' ore by the addition of various alkaline sodium salts where the same flotation-oils did very little good when used on the ore alone. If sodium sulphide were the alkali used this would not be surprising, as it could be easily seen that the sodium sulphide would react with copper carbonates and other oxidized minerals, forming sulphides and thus causing their flotation, but when sodium hydroxide brings about the same results it makes it seem possible that the thin films of oxidized material are dissolved off the faces of the natural sulphide particles. This would be possible with zinc, copper, or lead ores, since the hydrates of these metals are somewhat soluble in sodium alkaline solutions. Instances of improvement of the grade of work with ores containing each of these metals are known. I have not heard of many instances of the improvement of the flotation of pyrite by the use of such addition-agents. British Patent 5856 of 1914, granted to Minerals Separation and DeBavey's Processes Australia Proprietary, Ltd., states definitely that in the flotation of such tarnished ores the water in the circuit should be distinctly alkaline toward phenol-phthalein. Sodium carbonate is the alkali preferred.

The use of caustic soda has resulted in some degree of satisfaction, especially with the disseminated copper ores. At the September 1916 meeting of the American Institute of Mining Engineers, during the discussion of one of the papers, it developed that the Old Dominion mill at Globe, Arizona, was using caustic soda to the amount of one pound per ton of ore. According to the metallurgist, W. B. Cramer, this yielded a much less viscous froth, which lay more flatly in the flotation machine, was more easily broken down, and ran more readily in the launders, so that not so much water was required. This, in turn, permitted better practice in the overworked Dorr thickeners. Further, the recovery was somewhat increased, the grade of the concentrate was raised, and hence less 'insoluble' was left in the concentrate. At still another mill there also resulted a reduction in the flotation-oil necessary.

It is noticed that such alkalies produce a weaker and more mobile froth. The effect of the addition of alkali to a ball of stiff clay lying on a board is well known. A drop of alkali will cause the clay to flatten out, whereas the same amount of water does not. The alkali deflocculates the clay so that it 'liquefies.' So also the alkali tends to deflocculate the gangue-slime, and therefore any desirable mineral particles entrained in the flocks will be liberated and become available for flotation. In consequence less flotation-oil and agitation will be necessary in the attempt to break up the flocks and bring the oil in contact with the sulphide minerals. Not so much air

being necessary to bring the mineral particles to the surface, there will not be such a large proportion of mechanically entrained gangue in the concentrate.

Of the various alkalies used, caustic soda, sodium silicate, sodium carbonate, sodium sulphide, and lime are the principal. Sodium silicate is a more powerful deflocculent than sodium hydrate, possibly owing to a 'protective' action of the colloidal silicic acid formed in dilute solutions. It was used for a while with success in the flotation plant of the Utah Leasing Co., but was later displaced by sodium carbonate. Our own experience with many different types of minerals, at the Salt Lake station of the Bureau of Mines, has been that sodium carbonate is the most desirable alkali as it does not tend to deflocculate the gangue slimes so permanently, allowing easier thickening and filtration of the flotation concentrate and tailing.

A surprising claim is made in U. S. Patent 1,203,341 of October 31, 1916, granted to Allen C. Howard of the Minerals Separation Co. He claims that if alkaline substances are made up into a strong solution and the proper amount dripped into the first cell of a series of flotation machines a better result is obtained than where the circuit-water is already alkaline to the same extent. Attempts to check this claim by experimentation in our laboratory have failed to justify it. The patent says that in the mill of the Caucasus Copper Co., in southern Russia, this effect is quite marked. We fail to understand just how this can be so, and strongly suspect that the patent is actually attempting to claim the use of these alkalies in the manner in which they are most naturally used, in the form of a strong solution, the proper amount of which is dripped into the pulp at the most convenient point in the flow-sheet. To avoid infringing the patent the alkali would have to be previously mixed with all the mill-water before the ore was ground in it, which might prove more expensive and less easily performed.

Lime is not such a desirable addition-agent as the alkaline sodium compounds; and while it may cause desirable effects when added in small amounts, an excess is often harmful. Lime and most other calcium compounds are usually flocculators of gangue-slime, rather than deflocculators as the alkaline sodium compounds are. This may explain the difference between the two, although it has been hinted often that we know too little about the degree of flocculation of the ore-pulp during flotation. It is probable that in the cases noticed where lime improves the flotation it functions in precipitating other less desirable soluble impurities, such as the iron sulphates. At the Miami mill it was found that when lime was added to the pulp before entering the ball-mills an increased recovery was obtained, whereas the addition of lime at the head of the flotation-cells resulted disastrously. Supposedly the lime had to be allowed time enough to react with all the soluble or semi-soluble impurities of the pulp before going to the flotation machines, so that there would be no raw caustic lime to cause trouble.

Sodium sulphide and calcium sulphide or polysulphides are used in the flotation of oxidized ores of lead and of copper. Hydrogen sulphide is also in use for the same purpose in the flotation of copper-sulphide ores. The oxidized minerals are 'sulphidized' by these chemicals and can be floated in the same manner that the natural sulphides can be floated. However, there is no objection to using sodium sulphide or the other sulphides to precipitate soluble heavy-metal salts from solution. Hence these soluble sulphides can serve a double function. Three mills are now in operation using sodium sulphide in the sulphidizing of lead-carbonate ores and several copper mills use it for oxidized copper compounds. The method is fairly satisfactory because only small amounts of the sodium sulphide are used, the lead-carbonate particles being merely coated superficially with a film of lead sulphide that can be oiled and floated. As little as three pounds of sodium sulphide per ton of ore containing 15% lead is successful in causing the flotation of over 90% of the lead minerals. Manganese di-oxide or basic iron sulphates or lead-peroxide minerals tend to use up the sodium sulphide before the lead carbonate is satisfactorily sulphidized. Since such minerals are fairly common in the oxidized ores of lead the method can be applied to only those ores which are free from such constituents. Hydrogen sulphide is in use in the mill of the Magma Copper Co., at Superior, Arizona, sulphidizing copper carbonate.

Of all the alkaline compounds mentioned above, lime is the cheapest, but not the most desirable. Sodium carbonate is not only highly desirable but also can be obtained more cheaply than most of the other sodium compounds. In fact, most of the flotation work which calls for the use of sodium carbonate is situated in the inter-mountain region not far distant from the alkaline lakes and natural trona deposits of the arid and semi-arid regions. An outlet for this natural soda has long been desired. At the present time most of the soda in use by flotation-mills is shipped from the East and is much purer and more expensive than the work demands.

Sodium sulphide also costs too much when delivered into the inter-mountain country from the Middle West or the East. It can be made from nitre-cake or from sodium sulphate by reduction. Sodium sulphate is available in a fair degree of purity from deposits on the bottom of Great Salt Lake or from Searles Lake in California.

ORGANIC ACIDS like tartaric acid, citric acid, etc., and their salts, have been mentioned in British Patent 17,327 of 1914, granted to George A. Chapman, one of the Minerals Separation engineers. Argol, the crude tartrate of potassium, was added to the pulp in both the Anaconda and the Burro Mountain mills, which are treating copper ores. The argol was introduced into the pulp as it entered the tube-mills, in amounts ranging from one-tenth to one-fourth of a pound per ton of ore. Both of the ores mentioned are noted for the high percentage of colloids present, due to clay-like minerals. The flotation results were said to be greatly improved. The effect of the tartaric acid seems to be a slow flocculation or coagu-

lation of the gangue-slime. These organic acids and their salts are known to have low dissociation constants and the theory advanced in Chapman's patent is that these reagents do not flocculate the gangue-slime so quickly, but that the sulphide minerals escape entrainment in the flocks so that they are collected by the oil and air into the froth before flocculation of the gangue. To quote the words of the patent, "the effect of electrolytes upon colloids (as is known) depends *inter alia* upon the valency and upon the ionizing power or dissociation constant of the electrolyte. Tartaric acid is divalent and as compared to ordinary mineral acids it has a low dissociation constant. Citric acid has similar properties but is trivalent. Many other electrolytes such as organic acids and their salts also have similar properties as electrolytes and the choice of a suitable electrolyte for the purposes of this invention can be readily determined by a preliminary test."

This is a most interesting theory, but I have noticed that citric acid, which is mentioned above, usually does not flocculate gangue-slime but rather exerts the reverse effect. It is probable that the effects of organic acids in flotation will be found to be as erratic as their adsorption effects, commonly known to colloid chemists.

SILICO-FLUORIDES. British Patent 4938 of 1914, granted to H. L. Sulman and Minerals Separation, calls for the use of silico-fluorides as a substitute for acid. It is claimed that these compounds give the desired results. The complex fluorine salts have rather unusual ionization and other chemical constants, and hence it might easily happen that their effects on flotation would be unusual and hard to predict. The diversity of the various compounds mentioned as having been patented by the Minerals Separation Co. shows how far their engineers and chemists have gone in developing the process.

A test of Broken Hill tailing was made in London tap-water without the addition of potassium silico-fluoride and another test was made with this addition-agent to the extent of 3.4 lb. per ton of ore. The oil used in each test amounted to 2 lb. of eucalyptus-oil per ton of ore. The data on the two tests were as follows:

ORDINARY FLOTATION				
	Heading	Concentrate	Tailing	Recovery
	%	%	%	%
Zinc .....	19.0	29.0	14.4	56.0
Lead .....	7.0	9.3	2.5	70.2
WITH SILICON-FLUORIDES				
Zinc .....	19.0	36.1	4.8	86.2
Lead .....	7.0	14.7	1.6	88.5

The patent also makes a good suggestion that the silico-fluorides can be prepared by adding hydrofluoric acid to the ore pulp. This produces soluble silico-fluorides of the bases in the pulp. The main value of a substitute for sulphuric acid would be for ores containing a great deal of calcium carbonate or other acid-consuming materials in the gangue.

CALCIUM SULPHATE is a compound which has been added to ores containing colloidal gangue, although its

success has been somewhat erratic. It was once used in one of the Broken Hill mills and its effect was that of an electrolyte. It is sparingly soluble, so that there can never be a high concentration of its ions in solution and it is hence more or less equivalent to the tartrates in providing ions rather slowly, so that, supposedly, the flocculation of the gangue-slime will not entrain particles of the desired mineral.

Sodium manganate and sodium chromate are two oxidizers recommended for differential flotation of two floatative minerals. They seem to deaden one or the other of the floatative minerals so that it will not float. The exact mechanism of this deadening action is not known, for while chromates will deaden galena particles in the presence of sphalerite, manganese compounds have the reverse effect. They are efficient in this type of work, but there is a wide-spread impression among metallurgists that they are too expensive. To be sure, the market prices on the chemicals usually sold are rather high, but extreme purity of these compounds is not essential. There is no apparent reason why they should not be made by fusing local manganese or chromium ores with sodium carbonate. Manganese ores are usually available in zinc and lead districts, whereas the chromium ores are harder to obtain. Mill-managers who have considered only potassium permanganate of the usual high commercial purity might well give their attention to the more cheaply prepared sodium manganate.

SULPHUR DI-OXIDE, SODIUM SULPHITE, SODIUM THIO-SULPHATE. These reagents are inhibitors of flotation, if used in sufficient amount. If sulphur di-oxide is applied to an ore-pulp the first effect is one similar to that obtained when sulphuric acid is added to the pulp, an improvement in the flotation. However, if the sulphurous acid is allowed to act on the ore long enough to form sulphites the result will be non-selective flotation and the gangue will be floated with the desired mineral particles. The great use of such compounds has been found in differential flotation, the basic idea being to add just enough of one of these inhibitors to deaden the surfaces of one kind of floatative minerals while another group is only slightly affected and can still be floated. Mixtures of sphalerite, galena, pyrite, and chalcopyrite or any two of them usually need separation and in case they need to be finely ground to be liberated from each other mechanically differential flotation methods are in demand.

CHLORIDE OF LIME is a reagent said to be good for differential flotation of sphalerite in the presence of pyrite.

SODIUM CYANIDE. In most cyanide-mills it has been found that the cyanide left in the tailing is deleterious to flotation. E. J. Atkison has informed us that in some tests made by him with the ore of the Amparo Mining Co., of Etzetlan, Mexico, this effect was noticed unless the amount of cyanide present was less than 0.007% on the weight of the ore or 0.0018% in the mill-water, under which conditions improved flotation results were ob-

tained over what could be done in water containing no cyanide.

At the mill of the Ohio Copper Co., in Utah, mine-water containing a rather high percentage of the sulphates of iron and similar impurities is used in the flotation and the addition of a small amount of cyanide has been found to greatly improve the flotation.

It is probable that in both these instances complex double cyanides are formed with the solutes in the mill-water and it may even be that some of the most undesirable impurities are precipitated by the cyanide.

CONCLUSION. The use of certain chemicals in the flotation concentration of ores has been described and theories of the action of these chemicals have been explained. The use of chemical addition-agents in ore-pulps during flotation is only in its infancy and as the process is better understood operators will make greater use of chemical addition-agents which will allow them to obtain the highest economic results. The possibilities of such applications are almost unlimited and it is probably along lines of this kind that some of the great advances in ore flotation will be made.

ACCORDING to Hoyt S. Gale, of the U. S. Geological Survey, two establishments, intended primarily for separating and refining potash salts from the water of Great Salt Lake, have been built, and one of them was in more or less regular operation in 1916. They are the Utah Chemical Co., whose plant is at 'Potash Siding' on the branch of the Salt Lake Route from Salt Lake City to Saltair, and the Salt Lake Chemical Co., whose plant is at Grants, a station on the Western Pacific Railroad about 30 miles west of Salt Lake City. The Utah Chemical Co. was organized to recover potash as a by-product from the waste liquors of the salt works near which its plant stands, and the Salt Lake Chemical Co. was designed to handle the lake water directly without consideration of the possible utilization of the salt it contains. The water of Great Salt Lake is a strong solution of sodium chloride and other salts, and it contains potash in about the same proportion to its other constituents as does sea-water. It carries about 20% of dissolved salts, however, whereas sea-water carries only 3.5%. The proportion of potash in the natural water is very small—less than 0.5% of the water and its contained salts—but when this water is concentrated by evaporation, the first salts to crystallize out are those which are nearest saturation in the solution—that is, common salt and sodium sulphate—some of the minor constituents, like potash, tending to remain in solution, and to collect and concentrate in the mother liquor. This general order of crystallization has determined the methods now used to separate the potash from both Salt Lake water and sea-water. The dried salt resulting from the evaporation of the lake water contains 3.16% potassium chloride, 75.91% sodium chloride, 10.92% magnesium chloride, and 9.52% sodium sulphate. Calcium sulphate and carbonate are present in small amounts.

# REVIEW OF MINING

## TONOPAH, NEVADA

TONOPAH MINING CO.—TONOPAH EXTENSION.—WEST END CON.

The Tonopah Mining Co. during the first part of September shipped 30 bars of bullion, valued at \$61,500. In the Silver Top 199 ft. of development was done, in the Mizpah 10 ft., and in the Sandgrass 35 ft. Stopping continues on the Burro No. 4 vein on the 540-ft. level in  $3\frac{1}{2}$  ft. of ore. A north cross-cut has been started on the 1500-ft. level of the new winze at the Sandgrass. Last week the production was 2550 tons.—The Tonopah Extension milled 9721 tons of ore during August, resulting in a net profit of \$32,444. At the Victor shaft 144 ft. of progress was made. On the 1440-ft. level the 605 east drift advanced on a 3-ft. face of ore, while 613 raise advanced on a 6-ft. face. On the 1680-ft. level the south cross-cut advanced 65 ft. Cross-cutting has been suspended on account of the large flow of water encountered. At the No. 2 shaft 115 ft. of progress was made. West drift 503 on the 1350-ft. level continues to advance on ore 3 ft. wide. The production for the past week was 2380 tons.—The production of the Tonopah Belmont was 2454 tons. The north-east drift 8005 on the 800-ft. level on the south vein has a 4-ft. face of ore. On the 1100-ft. level, raise 89 on the Rescue vein shows a 3-ft. face of ore, while the east drift on the Belmont vein continues in 4 ft. of ore.—The West End Con. Mining Co. is cross-cutting and rising from 415 east drift on the south vein in the hanging wall of the West End vein, which carries good ore. Raise 680, No. 4, holed through into stope 647, No. 4, facilitating mining operations. At the Ohio shaft drift 526 shows a good face of ore. Cross-cut 512 reached the foot-wall of the vein, and shows excellent ore. Cross-cut 555, No. 1, has also reached the foot-wall of the Ohio vein. Last week's production was 1095 tons.—The Halifax-Tonopah continues to drive on the 1256 and the 1704 cross-cuts, while 1018 cross-cut on the 1000-ft. level has been started to the east.

The McNamara Mining Co. has its mill in operation, and stoping has been resumed on the 200, 300, 350, 375, 500, and 700-ft. levels. Development on the 300-ft. level will be started shortly.—The Jim Butler-Tonopah Mining Co. continues to make its regular dividend of 10% semi-annually. It has at present \$84,000 in excess of that required. On the 800-ft. level from the 816 winze, east drift No. 3 and west drift No. 1 continue on the McNamara vein on low-grade quartz. The production for the past week was 350 tons.—The raise from the 1050-ft. level of the North Star property holed into the 950 main level. A drift has been started on one of the veins cut by the raise.—The Midway Mining Co. has commenced stoping on the 800-ft. level, where a 2-ft. vein was recently opened. The output for last week was 63 tons.—The Rescue-Eula produced 127 tons of ore, making the week's production at Tonopah 9519 tons with a gross value of \$166,582.—The new 200-ton mill of the Silver Mines Co. at Hornsilver will be started soon, according to S. H. Brady, the manager. The incline shaft has reached the 500-ft. level, while development on the levels above the 400-ft. level has provided sufficient ore to operate the mill at capacity.

The Kanrohat in Jefferson canyon, Round Mountain district, Nye county, has been taken over by S. H. Brady & Co. through a bond. The property is developed by ten adits and

four shafts which have proved considerable ore. The ratio of silver to gold is about the same as at Tonopah, 100 to 1. The property is equipped with a 150-ton mill which is in excellent condition.—On the Life Preserver, at Tolicha, the owners, Zeb Kendall and George Wingfield, are sinking four inclined shafts on the veins. Two parallel veins of quartz, varying from 10 to 30 ft. in width, in a rhyolite fault-zone, constitute the ore.—The Lone Mountain Lead & Zinc Mining Co. near Tonopah, is making regular shipments of ore, containing 25% lead, 10 oz. silver, and 3% copper per ton, to the Salt Lake smelter.

Tonopah, October 3.

## JUNEAU, ALASKA

TREADWELL.—LABOR SUPPLY.—GASTINEAU.

Of the properties operated by the Alaska-Treadwell group, the Ready Bullion, at the southerly end of the group, is the only one that is making any production. This mine contains the best ore found in any of the Treadwell properties, which is indeed fortunate, as it is the only one not flooded through the caving at the surface. There are now about 100 men employed underground and if the management could secure them it would have at least 250 men at work. The consolidated company is conducting exploration work on the Red Diamond property, which lies on the west side of Douglas island, and it is likely that if the Red Diamond should prove valuable the ore will be trammed across the island underground and hoisted and milled at the Ready Bullion.—The three other mines of the Treadwell group, namely, the Treadwell, Seven Hundred, and the Mexican mine, are entirely filled with water and completely closed. The only work being done is the dismantling and cleaning-up of the mills. The Alaska-Treadwell consolidation is exploring several properties in the North-West. In addition to the Red Diamond, just mentioned, the company has a crew at Auk Bay, about 10 miles up the channel from Juneau, exploring the Brie property. This is a low-grade gold deposit similar to those of the Juneau mainland. Another property on the Stikine river above Wrangell is being tested.

The entire district is handicapped by the lack of good mining labor. This is due principally to the high wages paid at the copper mines above Cordova, at Ellamar, and Latouche, and also to the higher wages paid by the Government to the men on the new railroad from Anchorage, as well as to the higher wages and better conditions of living in the base-metal mining camps of the States. All the gold mines of the world are working under a great disadvantage at the present time, it being often more profitable for the operators to close-down than to purchase supplies and labor at the extraordinary high prices now prevailing. This unusual prosperity in base-metal mining has led many men to engage in prospecting during the past summer and it is likely that the scarcity of men will be somewhat relieved when winter comes.

The scale in the Juneau district has been and still is \$3.50 per day for machine-men and \$3 per day for muckers. In order to meet the advanced scale of wages in the copper districts the mine-operators have introduced the plan of giving contracts on all mining with the exception of stoping, at such prices and with such conditions that the contractors are able

to pay their men 50 cents more than the regular wages paid by the companies. This is a good policy for all concerned, as it makes it possible for the contractor, thus offering a bonus of 50 cents per day to his men, to get more work out of a man per dollar than it would be possible in any other way. It likewise serves to keep the men from wandering to other districts, and it proves of advantage to the workmen, because the

Jackling-Hayden-Stone promotion, also on the mainland about two miles south of Juneau, has about 300 men employed underground and should have at least 600 men in order to operate to full capacity. The Alaska Gold Belt Mining Co., which was a promotion of Makeever Bros. of New York City, drove a 1600-ft. adit and did considerable diamond-drilling on their property in 1915. A snowslide in the winter of that year removed the surface plant, and as the owners would not take stock in part payment for the property and the operators did not make any discoveries of importance, the option was allowed to lapse and the property reverted to the original owners, Captain Harry Lott and R. P. Nelson. It is likely that development work on this property would have been continued further if money had been easy to secure, and the War had not advanced the prices of supplies and equipment. The Ebner mine, also in the Juneau belt, is being operated by the U. S. Smelting, Refining & Mining Co., employing only 10 men. This company is secretive about this work. At the Eagle River mine, 35 miles north of Juneau, there is no work in progress. The Chichagoff on the ocean side of Chichagoff island, south-west of Douglas island, is the only mine in the district

that has a full crew. This property produces a comparatively high-grade ore, and is fitted with a 30-stamp mill. W. R. Rust, formerly of the Tacoma smelter, Mr. Wallace, and Mrs. de Graff are the principal owners.

The Jualin Alaska Gold Mining Co. is employing only 50 men. The Kensington group, 65 miles north of Juneau, op-

cost of living has not been advanced as much at Juneau as it has in the districts where an increased wage-scale has been publicly announced and put into effect. That the local business-men have not sent their prices skyward as has been done elsewhere is shown by the fact that the company boarding-houses of the Juneau district have continued to charge \$30 per month for board and room since the War began. In general, it may be said that the collapse at Treadwell has cut off fully 75% of the business at Treadwell, 50% at Douglas, and 20% at Juneau. As an illustration of the loss suffered by the town of Douglas through the disaster, it may be mentioned that a house built last year in that town, and containing \$1200 worth of lumber, was recently sold for \$400, which included the lot. The loss at Juneau is principally on the sale of the better grades of merchandise and fancy goods that are not carried in stock in the stores of Treadwell and Douglas and in the saloon business, which drew considerable trade when miners from Douglas island, tired of the monotonous struggle, wanted a little vacation. As Alaska goes prohibition next January, the loss of the saloon business is only advanced a few months. The disaster has weeded out incompetent business interests that were struggling along on a precarious footing, and it has stimulated the fishing industry by giving a local market for the fisherman, who formerly had to take his product to the canneries near Ketchikan. The business-men of Douglas, particularly, in order to make up for the loss of trade, are catching small ice-floes, which float down Gastineau channel, crushing them, and boxing the fish packed in this ice for direct shipment to Seattle.

The Alaska Juneau Gold Mining Co., whose property is situated on the mainland near the town of Juneau, is now employing about 150 men, and could use 300 men to good advantage. The Alaska Gastineau Gold Mining Co., which is the

erated by the Kensington Mining Co., which is affiliated with the Alaska Gastineau Mining Co., would be operating under normal conditions and would employ about 300 men. This means that the district immediately tributary to Juneau, which should employ about 2100 miners, is now giving employment to about 600 miners, or less than one-third of its employing capacity.—Herschel C. Parker, of New York, who has been in charge of the examination of placer ground on the Kahiltina river, reports that platinum is generally distributed in the wash of streams in the mountains about Mt. McKinley.

ALASKA JUNEAU MINE

ALASKA JUNEAU G. M. CO. MILL

## VANCOUVER, BRITISH COLUMBIA

### CANADA COPPER.—LADYSMITH SMELTER.

Placer ground, covering some 300 acres situated between the falls on Perry creek and Saw Mill creek, is now owned by the Wild Horse Creek Gold Placer Mining Co., of which Mayer Clapp of Cranbrook is president. Preparation is being made to develop this ground next spring.—Slocan and Ainsworth mines shipped over 27,000 tons of ore to Trail this year.—Henry Krumb and W. H. Aldridge of New York and John M. Turnbull of Vancouver arrived recently at White Horse, Yukon. They have examined the Engineer mine at Atlin for Eastern capitalists. The Canada Copper Co. has contracted for a supply of electric power from the West Kootenay Power & Light Co. It will be used at the mines and concentrating plant that the company intends to establish near Copper mountain in the Similkameen district.—The Tonopah-Belmont Development Co. has instructed F. W. Heller, manager of the Surf Inlet mine, to examine the Dorothy Morton property with a view to re-opening it.—Stone is being quarried on Haddington island for construction of the new Canadian Northern station at Vancouver.—Magnetite assaying 67% iron has been discovered on King island.

Reports of progress at Alice Arm, the new mining camp near Prince Rupert in northern British Columbia, continue favorable. Considerable work has been done and some important new discoveries have been made. A strike of silver has been made at the North Star, which joins the Dolly Varden lode. It is about 20 ft. wide and the ore averages 70 oz. silver per ton.—A good showing is being made on the Moose property, owned by Don Cameron and Chris Nelson. An average of assays taken across a 16-ft. orebody runs 200 oz. in silver. In some places the lode is from 50 to 60 ft. wide. This property adjoins the Silver Hoard. George Coalback, A. McPhailand, and Pat Marley have discovered an orebody 100 ft. wide that has been traced for 3000 ft.—The Granby Consolidated has bonded several properties in Alice Arm district and has two diamond-drills at work. Several men are employed at the foot of the glacier on a copper prospect owned by Gus Pearson and A. Davidson.—The light railway to the Dolly Varden mine is progressing rapidly. Five miles of steel has been laid and 15 miles of grading completed.—From 1000 to 1200 tons of ore per month is being shipped from the Marble Bay mine to Tacoma. The mine is operated by the Tacoma Steel Co.—W. Trelour, G. Brister, and D. Weir are operating the Copper Queen on lease and are shipping steadily. The last shipment of 60 tons, from this mine, returned \$62 per ton. Good ore was struck on the 500-ft. level.—The Loyal group near Blubber bay, owned by E. W. Watson and H. A. York, has shipped ore running  $7\frac{1}{2}$ % copper and 4 oz. silver to the Ladysmith smelter.—The Pacific Steel Co. recently shipped 400 tons of 67% iron ore from West Redonda island to Irondale for experimental purposes.

Reports come from Dawson City that much staking has been done on the newly discovered placer creeks of Seymour and Kitchener creeks and their tributaries. One miner claims to have got 2c. per pan for four miles on Seymour creek. Bottom has not been reached.

Converters are to be added and other improvements made to the Ladysmith smelter and the company will make blister instead of shipping matte to Tacoma.—With the blowing-in of the Ladysmith smelter there is a good prospect of the re-opening of a number of properties on Mount Sicker on Vancouver island, which have been closed for years.—The Donohue Mines Co. is preparing to resume work at the Stump Lake mine.—The Kamloops Silver Mines Co., which has been incorporated by Smith Curtis, will operate the old Homestake silver mine.—The last shipment from the Blue Grouse mine, at Cowichan lake, to the Ladysmith smelter, averaged 8% copper.—A fine showing of silver has been uncovered acci-

dentally in excavating for a boiler foundation at the Silver Hoard. A carload of this ore, running 130 oz. silver, is ready for shipment.—A short tramway is being constructed on the New Hazelton gold and cobalt property from the mouth of the adit to the camp. Molybdenite is being taken from the mine and a shipment is to be made in a short time.—The Standard mine at Silverton is milling ore; the bins at the mine are full and the mill is running at full capacity.

The Granby Con. M. S. & P. Co. has purchased 350 acres of coal lands near Cassidy Landing, Nanaimo mining division, and will start active development work immediately. Coal mined from this property will be sent to Anyox.

## MONTERREY, MEXICO

### NEW BULLION AND MINERAL EXPORT LAW

American and other foreigners owning gold and silver mines in Mexico are greatly exercised over the recent decree issued by President Carranza, which requires that exporters of mineral ores or concentrate containing more than six grammes of gold per ton shall re-import in gold bars for coinage, or in foreign gold, an equal value to the gold content of the ore or concentrate shipped out; and that exporters of silver in bars or ore or concentrate containing more than 50 gm. of silver per ton must re-import in gold bars, or other foreign gold, 25% of the value of the silver bullion or ore shipped out.

It is claimed by these foreign mining interests that the putting into effect of this decree will practically mean the confiscation of their properties. It is common rumor here that German influences are behind this drastic move on the part of the Mexican government, and that its real purpose is that American-owned mines in this country may be forced into the hands of the coterie of Germans that have been active during the revolutionary period, and even more so of late, in acquiring rich mines in the different districts.—The recent decree places the foreign owners of gold and silver properties between two fires. If they do not work their mines they are subject to confiscation by the Mexican government, and if they do work them under the existing requirements it will mean bankruptcy to many.

The following is an official translation of the provisions of the decree without attempting to give the full text: First. The general prohibition to export gold or silver Mexican coins. Second. From September 28 the exportation of gold in silver bars is absolutely prohibited. Third. Exporters of mineral ores or concentrates of all kinds containing over six grammes of gold per ton will have to re-import in gold bars for coinage, or in national or foreign gold coins, an equal value to the gold content, as per assay of the minerals or concentrates, exported. Fourth. Exporters of silver in bars or mineral ores or concentrates, containing over 50 gm. of silver per ton must re-import in gold bars for coinage or in national or foreign coins 25% of the value of the silver content of the bars, mineral, or concentrates. Fifth. To ascertain the amount of the gold to be re-imported, the silver will be valued at the rating made by the treasury department for the collection of duties on the date of the exportation of the ore. Sixth. Exporters of silver in bars or minerals, and gold or silver concentrates, must give bond to the custom house at the point of export, or to the treasury department, for the amount of gold they must re-import. Seventh. Gold re-imported must be delivered to the mint for coinage within 30 days from date of introduction into Mexico. The mint will only charge coinage expenses. Eighth. Re-importations of gold must be made within 10 days of the exportation which they cover, it being understood that failure to make the re-importations will be punished by the forfeiture of the bond.

Protests against the decree are being prepared by American mine-owners, and will be forwarded to the United States government at Washington.

## ARIZONA

### COCHISE COUNTY

(Special Correspondence.)—Plans have been completed for the erection of a 450-ton mill, including flotation, at the Shattuck mine. This plant will treat silver-lead ore. It is expected that the mill and necessary development will cost \$500,000.

Bisbee, September 28.

### GILA COUNTY

(Special Correspondence.)—The Silver Peak claim of the Sulphide Copper Co. has been leased to some of the stockholders. The Northwest Inspiration Copper Co., adjacent to the Inspiration, has been carrying out preliminary work for the past nine months. A road has been completed and such surface equipment as hoisting-plant, compressor, power-plant, and head-frame have been put in place. It is expected that sinking will be commenced shortly.

Globe, September 27.

### GREENLEE COUNTY

(Special Correspondence.)—The companies and strikers in the Clifton-Morenci-Metcalf district are still at a deadlock. On October 1 the companies were supposed to resume operations and it was thought that the differences between them and the union would be settled. The companies wished the men to sign up as individuals and not as an organization. The men refused to do this, so all efforts on the part of the companies to adjust matters have been dropped.

The companies are now bulkheading all portals and mine entrances and there is every indication of a long shut-down. The three companies in the district, Arizona Copper, Phelps-Dodge, and Shannon, hope to complete the work of closing the properties by October 10.

The fire which was discovered August 21 in the Coronado mine, one of the largest mines owned by the Arizona Copper Co. at Metcalf, is still burning. The fire is between the 655 and 600-ft. levels. The work of bulkheading between the 500 and 700-ft. levels is nearly completed. When this is finished the burning area will then be flooded in an effort to extinguish the fire.

Metcalf, October 5.

### MOHAVE COUNTY

(Special Correspondence.)—With the advance in the price of silver practically every mine and prospect in the chloride district is being worked. The Oatman Gold Mining Co. has been organized and has taken over the Oatman United Mines Co., share for share. The new company's stock is assessable, and an assessment of 1c. per share has been levied to obtain \$17,000 for development work. J. J. Connolly reports that some fine ore has been developed on the old Byron Collins mine at Cobalt. The main orebody will assay \$100 in gold. Ten sacks of ore taken from the winze is expected to yield \$2000. Fifty tons of ore, averaging 65 oz. silver and 16% lead, has been shipped from the Granite Point silver-lead mine.—J. J. Robertson and associates have taken a lease on the Bella Union group of six claims. Machinery has been ordered; development will proceed pending its arrival.—The Mineral Development Co., operating the Golden Hammer and other

claims in the Mineral Park, is removing the entire equipment purchased recently from the Arizona Gold Star at Oatman. As soon as this machinery, consisting of 40-hp. gas engine, 9 by 8 compressor, and machine drills, is in place active development will commence.—The Hackberry mine is employing 30 men in development work. About 35,000 tons of ore is blocked out. Two carloads per week is being shipped, running 50 oz. in silver, 10 to 15% lead, and \$6 in gold.—It is reported that recent development has opened the main orebody of the Roadside mine, 25 ft. of \$12 ore is said to be proved, streaks of the ore will run \$100 per ton.

Kingman, September 27.

(Special Correspondence.)—W. B. Twitchell, of Phoenix, Arizona, is preparing to start operations on the Jack Pot mine. A good deal of work has been done on this property, but it has become necessary to add hoisting machinery. In the old shaft there is a vein of gold and silver ore, averaging \$100 per ton. A new shaft will be sunk.—A carload of machinery, including a 50-hp. gasoline engine and an air-compressor, has arrived and is being erected on the Merrimac.—The lessees of the Mary Bell have shipped a car of ore. This property has one of the strongest croppings in the district. The Rico Consolidated Mines Co. is erecting a new hoist on the Rice shaft of its property. This company has secured the C. O. D. mine.—The Emerald Isle plant is turning out 1200 lb. of electrolytic copper every day. Twenty cells are now in operation and 30 more are to be added. The Copper Age mine is driving its adit from the east and the west ends with all possible speed. When finished the adit will be 1300 ft. long.

Chloride, September 28.

## CALIFORNIA

### PLUMAS COUNTY

(Special Correspondence.)—A copper orebody 10 to 12 ft. wide has been exposed in the Madero mine, 25 miles from Portola, and operated by the U. S. Smelting, Refining & Mining Co. Arrangements have been made to increase developments, and to maintain work throughout the winter. Shipments will be made in the spring to Utah smelters. E. H. Greenwood is manager.

The Walker Copper Co. has 160 men at work; it is pushing a 16-mile electric-power line to obtain current from the Great Western system. Thirty-two men went on strike October 1, demanding a flat wage increase of 50c. per day. Miners are paid \$4, tool sharpeners \$4.50 to \$5, carpenters \$4.50, and surface labor \$3.50; board is \$1 per day. Mine developments are reported satisfactory. The flotation plant is treating 75 tons per day. Concentrate is shipped to the Tooele smelter, Utah. W. V. Hart is manager.

More miners have been employed at the Seneca Consolidated and Shaffer gold properties, and underground work at both mines is being pressed. Because of the difficulty in securing equipment, the management has decided to postpone construction of the cyanide plant until next spring. J. J. Reiley is manager.—The Plumas Grass Valley Co. has found rich gravel on the south fork of the Feather river. J. F. Buel is superintendent. On the Dinsmore group, R. A. Edgar and associates are prospecting promising gravel. Work has been suspended for the winter at the Monitor mine.

The Noble Electric Steel Co. is surveying for an aerial tram from its Braite manganese mine to Indian Falls, an approximate distance of 1½ miles. At present ore is hauled by teams to Crescent mills. Several manganese deposits in this field are attracting attention.

Portola, October 10.

## COLORADO

### BOULDER COUNTY

(Special Correspondence.)—The recent silver-strike at Caribou is turning out well. The size of the vein has increased from 2 ft. at the surface to 5 ft. at a depth of 30 ft. The high-grade streak is 12 in. wide and carries 41% lead and 200 oz. silver. The rest of the vein averages \$40 in silver and lead. The Comstock mine, leased to Hawkins & Co. by Gray & Perry, made a shipment of high-grade ore last week. The No Name, Silver Point, Poorman, Seven-Thirty, and Sherman are shipping regularly. The Up-to-Date and the Caribou have been shipping steadily for four years. A car of silver ore from the Up-to-Date at Caribou gave 140 oz. silver and 1.75 oz. gold.—A mill is to be erected at the Huron mine, Eldorado, this fall.—H Frank Hadley, superintendent of the Gold Hill, Boulder county, has resigned and will take charge of the Iron Mask mine at Breckenridge, Colorado.

Eldora, September 29.

### TELLER COUNTY

The production of gold ores by the mines of Cripple Creek during the month of September totalled 97,511 tons, with a gross bullion-value of \$1,028,554. The average value of the ores treated was reduced to \$10.54 per ton, due to the heavy treatment of low-grade ores at the local mills. The two Portland plants, the Independence and the Victor, milled 56,425 tons, with a general average of but \$2.04 per ton. This was dump-ore and ore-house reject. The treatment at the several plants was as follows:

	Tons	Value	value
Golden Cycle M. & R. Co., Colorado Springs .....	28,000	\$20.00	\$560,000 00
Portland G. M. Co.....	9,786	21.62	211,573.32
Portland G. M. Co., Independence Mill, Cripple Creek district....	37,100	2.05	76,075.00
Portland G. M. Co., Victor Mill, Cripple Creek district.....	18,325	2.02	37,016.50
Rex M. & M. Co., Kavanaugh lease, Cripple Creek district.....	1,400	2.00	2,800.00
Rubie mill, Bull Hill, Cripple Creek district .....	350	2.40	840.00
	97,511	\$10.54	\$1,028,554.82

Dividends paid in September were confined to the monthly distributions of the Cresson Consolidated Gold Mining & Milling Co., 10c. per share, \$122,000; and the Golden Cycle Mining & Reduction Co., 3c. per share, \$45,000, a total sum in dividends of \$167,000.

The September production from the Dillon mine of the Granite Gold Mining Co. totalled 72 cars, or between 2400 and 2500 tons. The ore mined on company account averaged slightly below \$20 per ton. Lessees on the Dead Pine, Upper Granite, and Gold Coin mines, were shipping, but returns are not yet at hand from the mills for all September shipments.—The Forest Queen mine on Ironclad Hill, active under lease to Edwin Gaylord, of Cripple Creek, produced 12 cars, or close to 400 tons of ore, during September, having an average grade of about \$15. This mine is owned by parties in California and Colorado.—The properties of the Gold Pinnacle Mining Co., on the eastern slope of Bull Hill, near Cameron, have been leased to Mrs. J. E. Dunn. A company, not yet recorded in Teller county, has been organized by Mrs. Dunn, and it is reported that the new concern has been strongly financed.—Work commenced on Monday of this week on the

Elkhorn, a property long idle, but at one time a producer. The Elkhorn has been leased to the Geraldine Mining & Milling Co., and it is said machinery will be installed. The mine is on the south-eastern slope of Carbonate hill, at no great distance from the city of Cripple Creek. Water-level has been reached at a depth of 1973 ft. in the main shaft on the Ajax mine on the south-eastern slope of Battle mountain at an elevation of 8135 ft. above sea-level. The Ajax is under lease to the Carolina company. This company commenced operations 10 months ago and has sunk the shaft 500 ft. since taking charge, besides cutting stations at the several levels.

Cross-cutting has commenced at the 1100-ft. level of the new vertical Frankenberg shaft on the Ocean View claim of the Modoc Mining & Milling Co., by the Modoc Consolidated Mines Co., which is now operating the property. Shipments will shortly be made from the mine.

The properties of the former Bull Hill & Straub Mountain Gold Mining Co., comprising 16,613 acres, contained in the Accident, Bull Domingo, Anna May Wells, Hannah Britt, Mae Clasby, Baby Dora, and Midnight lodes, were sold at public auction on October 1 to the United Gold Mines Co. The purchasing company owned 70% of the Bull Hill & Straub Mountain Company.

Deep development has commenced from the bottom of the winze sunk to a depth of 1500 ft. from the bottom or 1250-ft. level of the Lee shaft, by the Isabella Mines Co. on Bull Hill. The East Victor will be shortly cross-cut and another cross-cut is headed for the Buena Vista vein, 220 ft. west from the winze and about 400 ft. from the Lee shaft.

## MONTANA

### LEWIS AND CLARK COUNTY

Silver-lead ore is going to smelter from three mines in Grass Valley district and three more are expected to be shipping soon. The Helena mine is in the lead with 15 carloads to the smelter at East Helena. In Scratch Gravel Hills several properties are being worked profitable. The best producer is the Scratch Gravel Gold; \$60-ore is being taken from the 300-ft. level west. The mine is equipped with twin 80-hp. boilers.—The Thomas Cruse Developing Co. is shipping ore from the 500-ft. level.—The Blue Bird is mining and shipping copper-silver ore.—The Katie mine is producing a high-grade lead-copper product.—The leading producer in the Marysville section is the Shannon, under operation by the Barnes-King company. The Shannon, together with the Piegan-Gloster in Marysville camp, and the North Moccasin mines at Kendall, produced \$125,000 in bullion during August.—The St. Louis Mining Co. is running its stamp-mill on gold ore drawn from the old Drumlummon stopes.—The Bell Boy mine is again in operation.

A good strike of gold ore is reported from Bald Butte mine. A new compressor has been added to the mining equipment. Rich ore has been found in a lead parallel to the old Bald Butte.

The Eclipse-Argo Co. is sending four car-loads of 30% copper ore from its Hell Gate mine monthly.—The Economy Mining Co. is unwatering a 300-ft. shaft.—The Mt. Washington mine, at Wickes, is shipping a car of lead ore per day. This output is to be increased to two cars per day. The mine is just opened to a depth of 800 ft. by tunnel. The orebody at the face is 14 ft. wide.

## NEVADA

### HUMBOLDT COUNTY

(Special Correspondence.)—F. H. Vahrenkamp and associates of Salt Lake City and New York have arranged for the erection of a flotation plant at the Rye Patch mine and the addition of a flotation unit to the old mill of the Inlay group. The mill at the latter property will also be remodeled. The mines produced heavily 40 years ago and are said to contain large quantities of silver ore.

Re-construction of the recently-burned mill at Sulphur is proceeding, and Arthur Crowley, the superintendent, expects to start sulphur production within 30 days.

Discoveries of rich silver ore in the foot-hills of the Humboldt range, 12 miles south-east of Lovelock, are attracting interest. On the Badger group, M. D. Faretta and partners have been working five months and have opened a 5-ft. vein to a depth of 30 ft. It has been traced on surface for 200 ft., and ore exposed at 25 points. The ore averages \$40, and 50 tons is ready for shipment.

The Rochester Mines Co. has connected the 800 and 900-ft. levels and the 800 to the 650-ft. levels by raises. All ore is now handled through the Friedman adit, from which the buckets of the aerial tramway are directly loaded to the orebins. The winze from the 900-ft. level is down 50 ft. and as soon as the 1100-ft. level is reached development of the Adams lode will be commenced. The mill is crushing 217 tons per day. The management estimates the September earnings at \$70,000.

Lovelock, October 10.

#### NYE COUNTY

(Special Correspondence.)—Litigation has developed over the first claims located at Tolicha. David Ward of Goldfield has secured a court order restraining Edward Yeiser and J. J. Jordan from disposing of the Life Preserver claims to Zeb Kendall, on the grounds that Ward is entitled to a third interest by reason of a grubstake agreement. Despite many sensational stories, the deposits of the Tolicha field are not high-grade, but contain gold-bearing quartz of good milling character, so far as development has progressed. Prospecting is going on at fully twenty claims. Water is obtained from Monte Cristo springs, three miles distant, and from springs in the mountain. It is thought sufficient water can be developed in the gulches 2000 ft. from camp. The district is 48 miles by wagon-road from Goldfield, and an automobile stage operates between these points.

Whitman Symmes, of Virginia City, and Reno associates, have acquired control of the Union Amalgamated group at Manhattan and are arranging for development as soon as the final payment is made. The Wittenberg mill will be moved close to the mine and a three-compartment shaft sunk. Stamps will be replaced by ball-mills. On the 800-ft. level the orebody has been penetrated 22 ft. by the cross-cut with no indication of the hanging wall. Ore averages \$14 per ton. The main vein has been intersected in the cross-cut from the 550-ft. level of the White Caps mine, Manhattan. The ore is assaying from \$24 to \$28 per ton. The roasting-plant is now working satisfactorily and the entire mill is stated to be effecting a high metal extraction.

The Tonopah Belmont Co. has acquired a three-fourths interest in the Alta, St. Louis, and Palmyra gold properties, near Telluride, Colorado, and a mill and Jones-Belmont flotation process, is being erected. Besides gold the ores contain silver, copper, and lead. The subsidiary company will be known as the Belmont-Wagner Co. From the Belmont mine 2450 tons is going weekly to the mill.

The MacNamara company has resumed work on the levels from the 100 to the 600 points, and will soon start extensive operations on the 800. With silver above 90c. most of the ore exposed can be mined and milled profitably. The mill has been overhauled and is ready for operation. J. L. Joseph, president of the company, is personally directing affairs.

Tonopah, October 9.

### NEW MEXICO

#### SOCORRO COUNTY

An important discovery has been made during the week in the east 300-ft. level of the Mogollon Mines Co. While the management has not given out the details, it is understood that there is now 8 ft. of ore at the breast of the drift that

will average between \$30 and \$40 per ton. As this is approaching the orebody opened in the north end of the Deadwood, it is likely that it will be extensive. The Oaks Co. has opened a new orebody in the Maud S. mine. This is being developed from two sides and daily samples are running as high as \$30 per ton. This section has not been developed before.

The Socorro Mining & Milling Co. is ordering supplies for a narrow-gauge road to run between the Johnson mine and Fanny mill. This will be used to transport ore to the mill from all the holdings in the west end of the district.

All of the principal mines in the district are now on an eight-hour basis. While men are rather scarce, working conditions remain normal.

Mogollon, October 2.

### OREGON

#### JACKSON COUNTY

(Special Correspondence.)—Marshall mine, eight miles east of Wolf Creek station on the Southern Pacific, was operated many years for gold. Chrome ore was recently discovered in the mine, which is now being worked for that mineral. The ore is crushed and concentrated on standard tables. The ore is said to contain 30% and the concentrate 65% of chromic oxide.

Medford, October 6.

#### JOSEPHINE COUNTY

(Special Correspondence.)—John Hampshire, of Grants Pass, and associates are considering the purchase of the Waldo copper mine, one mile east of Takilma. The property consists of 480 acres of patented ground and 12 unpatented claims, and 325 acres adjoining the Queen of Bronze and the Lytle mine, both of which are owned by the new purchasers. Col. Draper operated this property between 1900 and 1906 and the ores were treated at the Takilma smelter. Litigation, however, on account of the sulphurous fumes caused its closing down. The total output has been about \$300,000. The price is said to be \$135,000.

Grants Pass, October 6.

### SOUTH DAKOTA

#### LAWRENCE COUNTY

(Special Correspondence.)—The concentrating plant of the Custer Peak M. & M. Co., near Roubaix, has been completed and is now treating ore from the 300-ft. level. The new equipment consists of ten stamps, Harz jig, ball-mill, and four Wilfley tables. The ore carries native copper, gold, and silver. —The machinery for the concentrator of the Spokane Lead & Silver Co., of Custer, has arrived. Several shipments of high-grade material have been made to the smelter.—The Refinite company, at Ardmore, has nearly completed its new plant for the treatment of kaolin. The mineral is found in large deposits in that district and is readily recovered. The capacity of the plant is estimated at 10,000 lb. of dried product per day.—The south-western portion of South Dakota is being prospected for oil, and already several companies have been formed to develop the Ardmore field. The Hat Creek Co. has leased a drill and will commence work near the centre of the dome. The Shiloh company holds leases on land adjoining the Hat Creek and a Des Moines company will operate a few miles north of Ardmore.

The Black Hills Tungsten Co., of Hill City, is re-modeling its plant. The mine is being put in shape for a regular production. The concentrator will handle custom ore. Emil Anderson, formerly in charge of the Homestake tungsten plant, is superintendent.

The Trojan company has leased the property of the Republic in Black Tail gulch, and is making regular shipments to the mill at Trojan.

The Crawford Mica M. & M. Co. has re-opened the Old Mike mine near Custer and is shipping mica at the rate of one car

per week. A new kerosene engine and a compressor have been erected.

The Homestake company is changing its plant to use electric power for everything except the hoists. The boilers at the several shafts will be removed and steam will be furnished to the hoists from the central plant. The Nordberg hoist at the B and M shaft has been placed in commission and the six-ton skips are removing the ore at the rate of 1400 tons per shift.

Lead, October 4.

## UTAH

### JUAB COUNTY

(Special Correspondence.)—The car shortage is again making itself felt, especially in the Tintic district; which, by the way, is one of the foremost mining districts of Utah. Forty men were laid off at the Mammoth mine on this account.

Mr. Rawson, the manager for the Tintic Delaware Mining Co., says that ore-hauling will start within the next few days, as the new road to the Tintic Delaware is now practically completed. The Tintic Delaware is at West Tintic; it was held for a number of years by the Ekker Brothers and only recently attracted the attention of Mr. Rawson and his associates of Salt Lake. Recent assays show that the ore is worth \$65 per ton, the predominant metal being lead.

The mines of the Tintic district should be reaping the benefits of the excellent metal market. The smelters and the railroads should be in position to handle the product of the mines, but instead we find that conditions, which have been very bad for several months, are getting worse. Most of the big mines of this district are being held back to a point where they can make little or no money, while some are unable to ship any ore at all. Here, in Utah, the smelters have not kept pace with the rapid strides of the mining industry and, to make matters worse, the railroads are making but a pitiable effort to handle the freight business.

The Utah Power Co. has made arrangements for the construction of a seven-mile line connecting the Tintic Standard property with the new drain tunnel, which is to be driven by Jesse Knight and associates.—The Tintic Drain Tunnel Co. has filed articles of incorporation with the county clerk of Utah county. The company is organized to conduct a general mining business, including the construction and operation of tunnels. The company's principal place of business is Provo. The capital stock is \$150,000, in shares of par value of 5c. each, based on the valuation of 300 mining claims along the route of the Tintic drain tunnel in the south-east end of the Tintic mining district. The following are the directors and officers: Jesse Knight, president; W. Lester Mangum, secretary and treasurer; John S. Smith, E. F. Birch, Henry Barney, and C. W. Reese.

At the Iron King property, in the eastern end of the district, the work of cutting out a large station on the adit-level, where the engine is to be placed, is practically completed. This engine, operated by air, will be used in sinking the first few hundred feet of the Iron King's new working shaft, but before the sinking is started a portion of the raise, which furnishes an opening through to the surface from the adit, is to be enlarged and re-timbered. The officials of the Iron King are fast getting everything in readiness for the extensive development which is to be taken up there. The management intends to thoroughly prospect the ground at a depth of several hundred feet.

The mill, which C. E. Loose and associates have erected at the Big Indian property in the La Salle range of mountains in Grand county, will be in commission within the next few days. Preston G. Peterson of Provo is on the ground looking after the milling operations for the Big Indian company.—The Central Eureka was this week listed on the Salt Lake Exchange, receiving an opening bid of 2c. per share. The company is capitalized for \$15,000 with 1,500,000 shares.

Mammoth, October 1.

# PERSONAL

*Note: The Editor invites members of the profession to send particulars of their work and appointments. This information is interesting to our readers.*

WILLIAM KENT is here.

CHARLES S. HERZIG is here.

HOWARD D. SMITH is at New York.

M. J. FALKENBURG is at Anchorage, Alaska.

HORACE V. WINCHELL is in San Francisco.

F. G. CLAPP is a Corporal in the Veteran Corps of Artillery of the State of New York.

KWONG WU, engineer for the Chinese government, sailed on October 11 on his way home.

GEORGE L. PORTER, president of the Afterthought Copper Co., at Ingot, California, has resigned.

ROWLAND KING is in San Francisco as company clerk of the second contingent from Spokane.

R. S. BURDETTE has been commissioned Captain in the Ordinance Section of the United States Reserve.

R. E. TREMOUREUX is First Lieutenant in the Engineer Section of the O. R. C. at Camp Lewis, Washington.

PAUL M. PAINE has left the Honolulu Oil Co. at Taft, California, and is now with the Gypsy Oil Co. at Tulsa, Oklahoma.

GEORGE E. FARISH of New York, together with R. R. LESLIE and U. A. FRITSCH, sailed on October 2 on the 'Peru' for Salvador.

PIERRE R. HINES has received a commission as First Lieutenant in the Engineer Officers Reserve Corps and is stationed at Fort Leavenworth, Kansas.

HUGO GILLESPIE has left the Clayburn Company to become superintendent of the Drumlunnon copper mine, south of Prince Rupert, British Columbia.

E. K. SOPER, formerly in charge of the department of mining at the University of Idaho, has been appointed Dean of the Oregon State School of Mines at Corvallis.

W. H. ALDRIDGE accompanied by HENRY KRUMB and JOHN M. TURNBULL of Vancouver has arrived at White Horse, Yukon. They have been examining mines in the Atlin mining division, British Columbia.

CAPT. W. H. LANDERS and CAPT. O. B. PERRY have been assigned to the Chief Engineers Office in the War Department, at Washington. They are preparing specifications for the mining machinery to be used by special regiments that will be sent to France.

A DINNER will be given in San Francisco on October 25 in honor of Ira N. Hollis, under the auspices of the joint engineering societies, consisting of the American Society of Mechanical Engineers, of which body Mr. Hollis is president, the American Institute of Mining Engineers, the American Chemical Society, the American Society of Civil Engineers, and the American Institute of Electrical Engineers. Mr. Hollis is now president of the Worcester Polytechnic Institute, and was formerly in charge of the engineering department of Harvard University. He was long connected with the Navy, and was active in the construction of the White Squadron. As an authority upon marine architecture his address in this city will possess peculiar interest and significance.

ROYAL CANFIELD PEABODY died on September 17. He was connected with the Combustion Engineering Corporation.

# THE METAL MARKET

## METAL PRICES

San Francisco, October 9

Aluminum-dust (100-lb. lots), per pound.....	\$1.00
Aluminum-dust (ton lots), per pound.....	\$0.95
Antimony, cents per pound.....	17.00
Antimony (wholesale), cents per pound.....	14.75
Electrolytic copper, cents per pound.....	23.50
Pig-lead, cents per pound.....	8.25-9.25
Platinum, soft and hard metal, respectively, per ounce.....	\$105-111
Quicksilver, per flask of 75 lb.....	\$105
Spelter, cents per pound.....	10.50
Tin, cents per pound.....	61
Zinc-dust, cents per pound.....	20

## ORE PRICES

San Francisco, October 9

Antimony, 45% metal, per unit.....	\$1.10
Chrome, 40% and over, free $\text{SiO}_2$ limit 8%, f.o.b. California, per unit, according to grade.....	\$0.60-0.75
Chrome prices show a tendency to remain stationary. With the advent of winter, when the haulage conditions are less favorable than at present, prices will be more erratic and are likely to go higher.	
Magnetite, crude, per ton.....	\$8.00-10.00
Manganese: The Eastern manganese market continues fairly strong with \$1 per unit Mn quoted on the basis of 48% material.	
Tungsten, 60% $\text{WO}_3$ , per unit.....	26.00
Molybdenite, per unit $\text{MoS}_2$ .....	\$40.00-45.00

## EASTERN METAL MARKET

(By wire from New York)

October 9.—Copper market is chaotic and prices nominal at 23.50 all week. Lead is dull and easy at 8 to 7.95c. Zinc is quiet and unchanged at 8.50c. all week. Platinum remains unchanged at \$105 for soft metal and \$111 for hard.

## SILVER

Below are given the average New York quotations, in cents per ounce, of fine silver.

Date	Average week ending
Oct. 3.....	93.62
" 4.....	92.12
" 5.....	91.12
" 6.....	90.62

The output of the Miami Copper Co. for September was 1,900,000 lb., as compared with 250,000 lb. in August and nothing in July. The June output was 5,340,000 pounds.

Anaconda's production of only 2,800,000 lb. for September was practically negligible as it compares with 29,400,000 lb. for September a year ago. With the mines operating today at only 55% it is doubtful if October will result in more than 20,000,000 lb. Last year the company, including the output of the Great Falls smelter, produced 331,900,000 lb. With the production for the second half of the current year curtailed, as it will require the balance of the year before the properties are in full working order, the total output of refined copper will be not more than 262,000,000 lb. This means a falling off of about 70,000,000 lb. from last year's returns.

It would seem safe to say that the price received for the copper this year will be as high as last, which was 25c. With a 15c. cost the profits for the year, not including the new source of revenue from zinc, and before deducting excess profits taxes, should amount to approximately \$11 per share. This will compare with about \$22 for 1916.

## ALUMINUM

The market is quite nominal at 41.50 to 42.50c. per lb., New York, for No. 1 virgin metal, 98 to 99% pure.

## ORES

Tungsten: Prices continue unchanged at \$23 to \$26 per unit for 60% concentrate, depending on the quality of the ore, scheelite being the best and held at \$26. Inquiries are appearing from European buyers but there is a question whether exports will be permitted. Ferro-tungsten is quoted at \$2.30 to \$2.60 per lb. of contained tungsten, but probably considerable can be obtained at the lower figure.

Molybdenum and antimony: Some business is reported in molybdenum ore at \$2.20 per lb. of contained  $\text{MoS}_2$  in 90% concentrate and this continues the quotation. In antimony ore the market is dull with nothing to report.

The total value of the mineral production of the country in 1916 was more than \$3,470,000,000, increasing \$1,076,200,000, or 45%, over the \$2,393,800,000 recorded for 1915, and exceeding the former record year (1913) by more than 1,000,000,000, according to preliminary figures compiled by the United States Geological Survey. Practically all the minerals shared in this increase, gold being the only one of the more important products that showed a decrease in value, though silver and anthracite showed decreases in quantity but increases in value.

# Eastern Metal Market

New York, October 3.

All the metals are unusually dull and inactive. The markets await the solution of perplexing problems arising from Government control of industrial activity. Producers in many cases do not know what course to pursue, and buyers are uncertain as to the future of prices and demand.

Copper is lifeless and nominal.

Tin is featureless and lower.

Lead is steadier but inactive.

Zinc is again idle and a little weaker.

Antimony is dull and unchanged.

Aluminum is quiet.

Price-fixing and its effect are uppermost in the minds of the steel trade. The market has come to a standstill, buying and selling being practically out of the question. There have been daily sessions this week of steel committees of manufacturers to work out prices on the full line of products in proper relation to those already fixed. Next week the President will announce prices in various grades of pig-iron, on semi-finished steel and a long list of rolled products. In all the confusion it is clear that the new prices will not figure much in general business for weeks. The pig-iron output in September again fell off, the total having been 3,133,954 tons for 30 days, or 104,465 tons per day against 3,247,947 tons in August, or 104,772 tons per day.

## COPPER

The copper market is still flat on its back. The resuscitation which was expected to follow the fixing of a Government price has failed to materialize. Indeed the situation seems to be worse than before the price of 23.50c. per lb. was announced. Until then some buying was possible; now practically nothing can be sold. Producers in general, especially the large ones, are unwilling to sell to ordinary domestic consumers at any price until the needs of the Government and its Allies are definitely known. Meanwhile contracts are being filled at prices agreed upon when made, which are probably in most cases above the present new price. There has been no known move to change contracts. Whether all grades of copper, such as Lake, electrolytic, arsenical, and casting-copper are to be maintained at the new price is still a perplexing question. It is admitted that consumers needing small wholesale lots are obtaining them from jobbers and other sources at from 26 to 28c. per lb. We continue to quote the Government price of 23.50c. per lb., but it is entirely nominal, as no transactions at this figure are reported. It was rumored yesterday that an important meeting of producers and consumers was in progress which would probably result in important news affecting the solution of many of these vexing problems. Copper exports in August are reported to be 42,285 tons, making a total of 342,904 tons to September 1, or only 40,000 less than the large total for 1913, and exceeding those for 1915 and 1916. The London market has declined to £125 for spot electrolytic and to £121 for futures.

## TIN

The tin market is at a standstill. It is both featureless and monotonous. The entire week, since our last letter, has been quiet. Yesterday and Monday were some of the duller days experienced in a long time. Cables have been delayed repeatedly, in most cases coming at least a day late. The market has declined from 61.75c., New York, on September 26, to 61.25c. on September 28, and to 60.50c. on both October 1 and 2. There is an entire absence of demand. Yesterday some spot, believed to be a small quantity, was pressed for

sale at 60.50c., New York, but takers were not eager. It is regarded as having been a 'distress' lot. Last Friday, September 28, was virtually a holiday (Jewish), and there was no desire to do business. Some little was done, however, including principally 25 tons of December shipment from the Straits at 57.25c., and 25 tons of January shipment at 57.12½c. September 27 was a quiet day, the sales totalling 100 tons, of which 25 tons was spot-metal at 61.62½c., and 50 tons December-January shipment from the Straits at 57.35c. On Friday September 28 there were a few sales of spot tin at 61.25c., New York. At the close of October 2 there were 60 tons of tin arrivals and 4500 tons reported afloat. The London market is lower at £245 10s. for spot Straits. Total tin deliveries for September are reported to be 5402 tons, of which 3302 tons came from Pacific ports to the East. Stocks of tin on landing on September 30 were 3297 tons.

## LEAD

It can safely be said that the lead market is steadier, and that it has largely recovered from the shock due to the sudden decline of 3c. per lb. in less than as many weeks. The decline is regarded as checked, but there is little activity. Buyers are still awaiting developments. Sellers certainly want orders, but seem unwilling to make concessions much below 8c. per lb., New York, which is still the quotation of the American Smelting & Refining Co. A moderate business has been done at 8c., and some small concessions have been made on a few large lots, but extended buying is absent. It is reported that some export sales have been made and that they are large, but no particulars are available. An explanation of the recent fall of lead is that pig-lead had to come to the present 8c. level in order to save the white-lead industry, because substitutes are making encroachments in the manufacture of paint. Lead is quoted in London at £30 10s. per ton for spot, and £29 10s. for futures.

## ZINC

The more confident and cheerful tone that has prevailed for the last two or three weeks has disappeared gradually in the last few days. The market is easier and lower, with demand very quiet, and sales of small consequence. Quotations have eased off a little until yesterday prime Western for October delivery was held at 8.12c., St. Louis, or 8.37c., New York, with about ¼ to ½c. higher asked for November and December delivery. Large producers for the most part continue to ask 8.25c., St. Louis, and 8.42 to 8.50c., New York, for October. Sales for October delivery have been made at 8.37 to 8.42c., New York. The only interesting transaction since our last letter has been the awarding by the Government of 1000 tons (2,000,000 lb.) of grade B spelter (99.50% zinc) to the lowest bidder, which was the American Metal Co. Its bid was 10.67c. per lb. as against a range of 11 to 12.12½c. from some other companies. It is to be recalled in this connection that early in September the Government fixed 12c. as its price for this grade of zinc, on 2,750,000 lb. it was to buy, but later withdrew the order for the material, deciding to go into the open market. The present sale is part of this order. The transaction has not had a stimulating effect on the market, but rather the contrary. The Government is also asking bids on 320 tons of prime Western, and awards are expected any day.

## ANTIMONY

There is no change since a week ago. Chinese and Japanese grades are still obtainable at 15 to 15.25c. per lb., duty paid, but demand is at a low ebb.

# INDUSTRIAL PROGRESS

## ALLIS-CHALMERS BALL GRANULATORS

The Ball granulator, as developed by the Allis-Chalmers Manufacturing Co., for wet crushing, was originally designed to crush 2 or 3-in. ore to a fineness of 10 to 80 mesh. Experience has shown it to be equally efficient as a fine grinder when reducing 8 to 20-mesh feed to pass a 100 to 200-mesh screen. After study of the principles of ball-mill grinding and the troubles experienced with the earlier designs a mill has been produced that eliminates these difficulties. Recent experimental work on the crushing of coarse material in ball-mills shows that the most efficient crushing effect is obtained by direct impact of the falling balls. While it is true that a large amount of grinding is done by attrition, or by the rubbing of the balls upon each other, it appears that the crushing of coarse material is effected mainly by impact and that attrition acts principally on fine material.

For practical purposes it is correct to assume that the pulp in a ball or tube-mill remains level and that this level is fixed by the height of discharge and is not affected laterally by centrifugal force at the speeds obtaining in ball-mill practice.

In the open trunnion-discharge type of mill, half full of pulp, a great deal of useful energy is wasted by the balls falling through the thick pulp, thereby reducing the force of impact. On the other hand, in a peripheral-discharge type of mill, when crushing coarse material, the ore receives the force of the impact of the balls and all this energy is utilized in crushing. When reducing 3-in. feed, the large feed acts as a cushion for the balls, but with fine feed, say  $\frac{1}{2}$  in. or less, the pulp does not offer sufficient resistance to give a cushioning effect, with the result that the balls strike on the shell-lining causing excessive wear of both lining and balls. By maintaining the pulp-level at a point sufficiently high to interpose a bed of pulp to partly cushion the impact of the balls, the maximum crushing effect with a minimum wear of steel is obtained. In no other ball-mill except the Allis-Chalmers ball granulator is there any means for controlling the pulp-level except by regulating the feed of ore and water. Such regulation is impossible to maintain at a fixed rate and ratio, hence the pulp-level cannot be regulated accurately by this means. The idea has been to design a mill in which the pulp-level can be positively controlled to suit the varying conditions arising in practice and to maintain a high crushing efficiency and a low ball and lining consumption. This has been accomplished. The pulp-level in the Allis-Chalmers ball granulator may be varied from discharging at the periphery to a point approximately half way between the trunnion and the periphery. This variation is obtained by a patented G-H diaphragm. This device consists of a diaphragm with radial ribs cast on the back and with round openings between the ribs opposite the screen or grating. On the inner face of this diaphragm is mounted a grating or screen

made of high-carbon steel bars, disposed radially, and spaced to suit the fineness of the product desired. The spaces between the screens are covered with liners held in place with through-bolts as shown in the illustration herewith. When the openings in the diaphragm are left open the mill will discharge to within three or four inches of the periphery, but by closing the outer ring of openings with wooden plugs the discharge is raised accordingly, and by

SPUR GEAR FRICTION PULLEY DRIVE

ALLIS-CHALMERS BALL GRANULATOR DRIVEN THROUGH SINGLE REDUCTION OF GEARS BY AN ALLIS-CHALMERS MOTOR

this means the pulp-level in the mill can be accurately regulated to suit the material crushed. Thus, without any change in construction, the mill can be adapted to almost any ratio of crushing and also for varying tonnages. The radial ribs act as elevators, lifting the pulp and discharging it at the trunnion level. Access to the wooden plugs may be had through the hand-holes on the outside of the mill. The screen-bars can be replaced without removing the mill from the foundation or dismantling it. The spacing of the

bars may be varied from  $\frac{1}{8}$  in. to  $\frac{1}{4}$  in. The capacity of the Allis-Chalmers ball granulator, with variable-discharge diaphragm, is from 30 to 40% greater than the trunnion-discharge type of mill with an increased power consumption of about 20% when discharging at the periphery. As the height of discharge is raised the capacity and power decrease proportionally until the maximum height of discharge is reached (a point about half way between the trunnion and periphery), when the increase in capacity is 15 to 20% and the power 10% over the open trunnion-discharge.

These ball granulators are designed for using hard iron or steel balls as a crushing medium. A mill loaded with balls has a capacity about  $2\frac{1}{2}$  times greater than when loaded with pebbles. Balls increase the capacity in direct proportion to the increase in weight. The weight of the balls and the height of fall determine the maximum size of feed that can be crushed. This explains why ball-mills loaded with 3 and 4-in. balls take a coarser feed than tube-mills loaded with pebbles of the same size. The capacity and power increases directly with the ball-load until it reaches a level slightly below the axis. Further loading does not increase the capacity whereas the power increases proportionally. Although in tube-mill practice the pebble-load is carried up to or in some cases above the axis of the mill, thus it is not necessary nor advisable to carry the ball-load up to the axis in an Allis-Chalmers granulator; in fact experience would show that on some ores the greatest efficiency is obtained by carrying the ball-load as much as 8 or 10 in. below the axis.

The ball granulator is an evolution from the tube-mill, but it has been found that the proportions suitable for the latter were not for the former, and accordingly the sizes given in the accompanying tables are taken as standard.

lifter arms and discharge-cone cast on the back. The diaphragm is held securely to the inside of the discharge-head with through-bolts, the ribbed side being next to the head. On the face of the diaphragm there is mounted a series of rectangular grates or screens disposed radially; each grate is made up of tempered tool-steel bars of rectangular section, set on edge and spaced to suit the product desired. These bars are held in place by steel wedge-blocks fitted with through-bolts, the wedge-blocks serving as liners to protect the diaphragm from wear. Back of each grating is a pocket or depression in the face of the diaphragm, to allow free discharge of the pulp through the grate. The bottom or back of this depression is perforated with a number of round holes allowing the pulp to discharge into the spaces between the radial lifter arms mentioned above. The spaces between the rectangular grates are covered by V-shaped wearing liners held in place by through-bolts. These liners are of the same depth as the grates so as to present an even surface. With all the perforations left open the mill will discharge to within three or four inches of the periphery but by closing the outer holes with wooden plugs the discharge level of the pulp is raised accordingly.

The feed and discharge-end trunnion are provided with hard iron removable liners. The shell-linings are furnished in either hard iron, chrome-steel, or manganese-steel. They are made in two different types, Wave type, and the Step lifter type. The shell is drilled to match the lining and the necessary bolts are furnished. The feed head is lined with removable liners of hard iron, chrome-steel, or manganese-steel, and is drilled to match and provided with the necessary bolts. All liners are removable and replaceable through the man-hole.

The main driving gear is of the Wuest double-helical type

STANDARD SIZES OF BALL GRANULATORS

The shell is made of cast-iron with flanges on each end, cast integral. These flanges are turned true and parallel with each other to insure proper alignment of the mill. The shell is cast with a rectangular man-hole fitted with a removable cover made of cast-steel. The cover is provided with suitable gaskets for making same tight and is arranged to carry a lining plate. The heads are of cast-steel of such proportions and design as to amply take care of the bending and shearing stresses. The discharge-end head is provided with hand-holes opposite the screen-pockets. These hand-holes permit of varying the pulp-level from the outside of the mill by inserting or removing plugs in the diaphragm. The flanges on the heads and shell are turned with male and female joints for carrying the shearing effect of the load. The heads are bolted to the shell with through-bolts; on the gear end sufficient stud bolts are supplied to permit of removal of the gear without removing the head. The hubs or trunnions are turned true with the axis of the mill.

All the ball granulators are fitted with G-H variable discharge diaphragm by means of which the discharge-level of the pulp may be regulated and maintained at any point, to suit the character of the ore and the ratio of reduction desired. This device consists of a cast-iron diaphragm having radial ribs or

made of cast-steel with teeth accurately machine-cut. It is properly machined, drilled to template, and bored concentric with the centre line of the mill. It is also provided with necessary bolts for attaching it to the head. The pinion is of the Wuest double-helical type with teeth accurately machine-cut to match the gear. The pinion has two external shrouds made of rings turned with a slight inward taper and shrunk on the pinion ends. This gives a construction which will stand the severest operating conditions. The pinion-shaft is made of forged steel and is forged integral with the pinion. It is properly key-seated on both ends for a flexible coupling and the length is such that either end may be used. This is done so that the pinion and gear may be reversed when the faces of the teeth on one side become worn.

With the Wuest gear-drive, the main trunnion bearings are mounted on adjustable sole-plates. Alignment is secured by aligning the mill axis to the counter-shaft axis. This does not disturb the alignment of the motor and pinion shaft.

Single-spiral feeders are adapted for handling 1½-in. material, and tonnages up to 400 tons per 24 hours. The 42-in. feeder has sufficient radius for elevating and returning the oversize from a mechanical classifier. These feeders are provided with manganese-steel wearing tips. The triple-spiral

feeder is designed for continuous feeding, and where there is no return material to be elevated. It will handle a maximum diameter feed of 2 in. and is not recommended for tonnages greater than 400 tons per 24 hours. The combination feeders are designed for the large tonnages now obtaining in ball granulator practice. They can handle large balls and coarse feed without clogging, and will handle mechanical classifier returns when the granulator is operated in closed circuit. The primary feed is spouted directly into the feeder through

## MARKET FOR MOTOR-TRUCKS IN JAPAN

"Japan offers an almost unlimited market to the American builders of heavy haulage trucks," asserted T. Tanaka of Tokyo, Japan, while in Lansing to inspect the 4-wheel drive truck manufactured by the Duplex Truck Company.

Mr. Tanaka, who came to Lansing with H. Chipman of Chipman, Limited, New York, export selling agents of the

the circular opening; it is then elevated and delivered to the mill by an interior spiral. An exterior spiral is also provided which elevates the mechanical-classifier returns and delivers them to the interior spiral.

### ANNOUNCEMENT

Worthington Pump & Machinery Corporation announces the opening of a new branch sales office at American Trust and Savings Bank Bdg., Birmingham, Alabama, to take care of a portion of the large territory hitherto controlled by the Atlanta office. This new office has been established with a view of rendering better service to the trade and affording more direct connection with the home office to that portion of the territory which it will control. Edward Stauverman, formerly with the Atlanta office, will be in charge of the Birmingham office as manager. The territory controlled by the Birmingham office will be of all the State of Alabama, excepting the following counties: Choctaw, Clark, Monroe, Washington, Conecuh, Mobile, Baldwin, and Escambia; all of the State of Florida, excepting the following counties: Okaloosa, Escambia, and Santa Rosa; and all of that portion of the State of Georgia south of the Seaboard Air Line running from Columbus, Georgia, to Savannah, Georgia.

All inquiries originating in this territory should, hereafter, be addressed to the Birmingham office, at American Trust and Savings Bank Bdg., instead of to Atlanta, as heretofore.

The States of North and South Carolina and that portion of Georgia north of the Seaboard Air Line will continue to be served by the Atlanta office under the management of A. W. Jones.

Duplex company, was most favorably impressed with the Duplex truck, after he had witnessed a demonstration by a 3½-ton model.

"There is a big market in Japan for such a truck as you manufacture," Mr. Tanaka told H. M. Lee, president of the Duplex company.

"We have many undeveloped mines in our country and road construction is just starting. At the present time this work is being conducted slowly and expensively, because little labor-saving machinery has been brought to our country. There are not more than 50 heavy haulage trucks in Japan today.

"Of course there has not been a great demand for trucks in Japan in the past because the resources of our country were undeveloped and there was a scarcity of money. But there has been an almost phenomenal change in Japan since the War in Europe started.

"Millions of dollars have been sent to Japan—our exports have increased by leaps and bounds—and as a result labor-saving machinery and up-to-date methods are replacing our centuries-old customs. We have the money to pay for trucks now, and I believe that thousands of heavy haulage motor vehicles will be imported into Japan during the next few years."

### 'BAD SPOTS'

If a wire rope breaks, apparently without cause, or develops what seems to be a defect at a particular place, it is sometimes referred to as having a bad spot. This is a physical impossibility. A standard 6 by 19 hoisting rope contains 114 individual wires. Each is a unit. Each of these units is

separately tested for tensile strength, elongation, torsion, etc., before it is accepted for use.

But granting that each wire could contain a defective section of a few inches, the defective parts would have to be laid with precision at that particular place; manifestly it can't be done. A bad spot, so called, must be accounted for in some other way.

It is not only more economical to prolong the life of wire rope by proper lubrication, but during this period of wire-rope shortage it may prevent a complete shut-down. No one would try to run an engine without oil. Why expect more of your wire rope?

## SENN PANNING-MOTION BATEA AMALGAMATOR

Early on the morning of September 3 the new 150-ton mill of the Cerise Gold Mining Co., about one mile beyond Wilbur Springs, Colusa county, California, was discovered to be in flames and the main building was completely destroyed. By September 18, or in less than two weeks, lumber had been transported by motor-truck over the 25 miles of foot-hill and mountain road from Williams and a large portion of it from Colusa and Willows (considerably greater distances), the ruins had been cleared up, and new buildings erected complete with everything ready to operate except the amalgamators and concentrators which were then on the way. This quick action on the part of the management indicates the confidence of the directors and stockholders in the property, the milling process adopted, the spirit of co-operation between the management and their employees and the various business concerns with whom the company is doing business.

The operations of the Cerise Gold Mining Co. are of considerable interest because of the fact that the property has been known and operated at different times during the past thirty or forty years both for gold and for quicksilver. Early operators of this property were among the first to use concentrators for the recovery of cinnabar from its ores. Various methods were employed in attempts to recover the gold contents of the ore, but apparently they were only partly successful. The ruin of old mills indicates the use of stationary amalgamating plates, grinding pans shaking plates, and it seems probable that the cinnabar concentrate was re-ground in grinding pans and re-treated over shaking plates after having been re-treated.

The present management spent over a year in sampling the old workings and in making tests, which included amalgamation and oxidation. Amalgamation tests were finally made by the Charles Bowers Co. of Oakland on 100-lb. samples, crushed through 20 mesh, and passed over the Senn panning-motion batea amalgamator in a pulp of about three tons of water per ton of ore. The results of these tests proved so satisfactory that a plain amalgamating mill was decided upon, with concentration as an addition as soon as the crushing and amalgamating end of the mill was in full operation.

The mill originally built by the above company included a jaw-crusher, belt-conveyor, Hardinge conical ball-mill stationary amalgamating plates, followed by four 8-ft. diameter Senn panning-motion batea amalgamators. The original flow-sheet did not call for any stationary amalgamating plates, but the mill erector insisted upon the use of these plates. This appeared at the time to be superfluous but it now seems fortunate, inasmuch as it proved the selection and use of the Senn batea amalgamators to be a wise one for, although the mill was only operated long enough to get the various parts running smoothly and had not been brought up to more than about one-half capacity when it burned down, its operation up to that time showed no saving whatever on the stationary amalgamating plates, while the amalgam was building up very satisfactorily on the Senn amalgamators that were in

use. Therefore the management immediately ordered new Senns to replace the four machines that were ruined by fire, and is also equipping the plant with Senn panning-motion concentrators to save what gold may be contained in the sulphides as well as the cinnabar. In this connection it may be explained that the cinnabar is not uniformly distributed over the entire property but occurs with considerable richness in some parts of the gold-bearing deposits, while other parts contain practically no quicksilver.

The workings of the above property are all tunnel or open-cut development. Most of the ore is of a silicious-shaly nature and practically all of the value seems to occur in the small seams and fractures. The country in every direction abounds with mineral springs, some of which are hot and many of which are highly sulphurous. Some of these springs act as miniature geysers. Some natural gas and some oil are also found in this district. Some of the rock is so rich in sulphur that the ore in the mill-bin burned for twenty-four hours or more following the burning of the bin, and masses were fused together until they resembled porous lava.

The gold-bearing ore pans freely, but the gold is coated and does not amalgamate readily. It seems to require a contact with the mercury of considerable time before it will yield to amalgamation. The grinding in the ball-mill may not be sufficient to thoroughly clean the gold, or its grinding in the presence of free sulphur and oil and other fouling substances may re-coat it as fast as it is polished, or the ball-mill may flour the gold so that it does not readily settle out of the pulp stream. Any one of these three conditions would explain the failure of the stationary plates to recover the gold.

The Senn panning-motion batea amalgamator pans the pulp first in the amalgam bowl on top of the liquid mercury. The coarser particles are here brought into intimate contact with the mercury and pick up particles of this mercury, even though the gold does not unite with the mass of the mercury in the bowl to form amalgam. These particles of gold carrying attached particles of mercury may gradually work out of the bowl and on to the plates covering the batea top, where they will immediately settle, and the further contact of the mercury-coated gold particles would finally insure amalgamation on these deck-plates. The finer disks of floured gold that would be carried along over the stationary plates in the pulp current would be panned down onto the batea plates and there amalgamated.

This mill of the Cerise Gold Mining Co. is only a preliminary installation to prove the correctness of the process and is of particular interest because of the difficulty that has formerly been experienced in the attempt to recover the gold by amalgamation from these same ores. The results secured at this plant will be of interest and value to free-gold properties wherever difficulty in saving free gold by amalgamation has been experienced on account of fouling materials contained in the ores.

The efficiency of the above mill, as originally built, is indicated by the fact that it was impossible to discover any trace of free gold or quick by panning the tailing although the heads panned gold freely.

## SAFETY EXTENSION

The General Electric Co. has extended the idea of safety to the benefit of the users of the electrical apparatus manufactured by the company, as well as that of the employees of the company in its factories. Safety switchboards, safety switches, safety controllers, "fool-proof" motors, transformers, etc., have been devised, and while definite statistics are not available it is quite reasonable to assume that accidents from electric shock are being minimized in public-service corporations, and among the general public who operate electrical devices in the home.

NOTES ..... 559

GRINDING ORE FOR FLOTATION..... 560

Errors in estimating grinding capacity of mills; special problems presented by different ores; character of ore determines character of comminuted product and adaptability of any particular mill; how a ball-mill crushes; gel-colloids produced in grinding; object aimed at in grinding for flotation. *M. & S. P., October 20, 1917.*

AN AMERICAN PEACE ..... 561

Subscriptions to the second Liberty Loan; thoughtful purpose of the public evident; no compromise with the enemy; politico-social influence of the loan and of direct taxation; news from Germany meant to delude; need of less talk about peace; we must fight until we can dictate an American peace. *M. & S. P., October 20, 1917.*

COPPER PRODUCERS COMBINING ..... 562

Production of copper decreasing; demand for copper growing; organization of producers to regulate output and markets; Government should aid the effort to control production and stabilize prices in the open market. *M. & S. P., October 20, 1917.*

### DISCUSSION

MILL-TESTS V. HAND-SAMPLING

By H. R. SLEEMAN ..... 565

Knowledge of methods not sufficient; bulk-sampling v. soil-sampling; mill-tests invaluable; importance of character of the ore; difficulty of accurately sampling mixed hard and soft ore; sampling by drilling holes and taking the drillings for assay; special difficulties of sampling can be overcome by taking pains and not stinting expense. *M. & S. P., October 20, 1917.*

### ARTICLES

MIAMI, ARIZONA: THE MILLING OF THE ORE—IV

By T. A. RICKARD ..... 565

Crushing problems; original system, and changes necessitated; flow-sheets of ore-crushing department and concentrating plant; comparison of results in

comminution with rolls, Chilean mills, and Hardinge mills; screen-analyses showing larger proportion of fine granular material obtained by ball-mill grinding; steel balls v. pebbles in ball-mill work; flotation at Miami; relation of fineness of crushing to high recovery in flotation. *M. & S. P., October 20, 1917.*

OFFICIAL LIST OF TECHNICAL MEN..... 574

*M. & S. P., October 20, 1917.*

FLOTATION OF LEAD AND ZINC IN THE JOPLIN DISTRICT

By C. A. WRIGHT ..... 575

Tests on the adaptation of the flotation process to Joplin ores; present methods of concentration; recovery by gravity concentration 68.6%; flotation yields 93.2% recovery of total lead and zinc; 1 lb. oil per ton gives higher recovery; six mills now using flotation. *M. & S. P., October 20, 1917.*

UTILIZING PYRITE IN COAL ..... 578

*M. & S. P., October 20, 1917.*

MECHANICAL VENTILATION FOR METAL MINES

By GEORGE RICE ..... 579

Want of attention to ventilation at metal mines; causes of impairment of air in metal mines; effect of foul air on health and efficiency of workmen; control of air-currents as a protection in case of fire; general principles of ventilation. *M. & S. P., October 20, 1917.*

CHILEAN MILLS ..... 581

*M. & S. P., October 20, 1917.*

THE CHEMICAL EXPOSITION

By M. W. VON BERNEWITZ ..... 582

Attended by 25,000 technical men; outline of exhibits; new apparatus; metals and metallic products; cyanide from cyanamid; fume-treatment methods; exhibits of raw materials. *M. & S. P., October 20, 1917.*

Transporting Union Drill over 40-Mile Trail

These field Photographs show what can  
be done with a

## UNION CHURN DRILL

Upper picture shows the drill being transported over forty-mile Alaskan trail.

Center picture—drill set up and drilling  $6\frac{3}{8}$ -in. diam. hole to a depth of 60 ft. at rate of 2 to  $2\frac{1}{2}$  ft. per hour using  $\frac{9}{16}$  gals. gasoline per hour.

Base picture shows drill being moved to next hole by drill-crew. Weight on wheels 2150 lbs.

Insert shows a block of granite, fifteen inches thick, with a  $4\frac{3}{4}$ -in. diameter hole drilled through in a demonstration. Time, one hour and fifteen minutes.

**G**REAT BRITAIN has increased its output of steel from 7,000,000 tons per annum before the War to 10,000,000, and facilities are being provided that will admit of a production of 12,000,000 tons next year.

**A**SSESSMENT-WORK on mining claims, with the exception of oil, will not be required for the years 1917-18. The bill exempting claim-holders in general, in addition to those enlisted in the Army and Navy, from this obligation imposed by the mining law substitutes a lieu service for assessment work. We will publish the full text of the Act in a later issue.

**U**NDoubtedly the demand for various metals and minerals in all the belligerent countries is stimulating governmental interest in the mining industry, and to that extent it will prove useful even when the War is ended. In every country a systematic examination of its mineral resources is being made under official instigation and from it there will come enlarged knowledge, as well as a more sympathetic interest in mining.

**M**EXICAN labor is becoming scarce in Arizona and New Mexico. Part of the difficulty experienced at the mines in those States from shortage of workmen is due to the repatriation of large numbers of refugees who had sought freedom from conscription at home during the revolutionary turmoil. Fleeing from one war they rushed into another, and the call for registration by our Government produced an exodus. German sympathizers encouraged the Mexicans to believe that men of all ages would be drafted, thus intensifying the labor stringency in the South-West.

**V**ILLA is still active, despite the denials of the Mexican government. Only a few days ago Col. Miranda, with four survivors of a sanguinary encounter with Ildefonso Sánchez of the Villa party, escaped across the border near Candelaria and surrendered to a troop of the Sixth Cavalry. Such episodes indicate a vigorous opposition that should not be suffered to exist if Carranza would have us believe in the stability of his administration. A government that seeks a loan of hundreds of millions should remove the doubt as to its ability to apply this in the economic redemption of the

country by an effective campaign against these revolutionaries. Carranza has long displayed a tender regard for the personal freedom of Villa that never has been satisfactorily explained.

**S**PAIN has undertaken to establish Government laboratories in all the provinces of the country for making commercial analyses as well as for assaying and metallurgical testing of mineral products. The services of these laboratories will be available to the public at cost. A notably increased activity in the development of Spanish mineral deposits has resulted from the demands occasioned by the War. Despite the milleniums during which the Iberian peninsula has contributed to the world's supply of copper, lead, and iron, there remain undeveloped resources that promise to become important.

**C**ORRECTION of proof often leads to the duplication of error. In this way the meaning of an author may be obscured. Such a fate befell the article on 'Drop of Pressure of Compressed-Air Hose,' by Mr. Walter S. Weeks, published in our issue of October 6. The last few lines at the bottom of the first column on page 504 should have stated that "The hose with the most 'give' has the least drop in pressure, because when it is under pressure the diameter of the hose is slightly increased. The more expensive hoses, which have a layer of rubber between the wraps of duck, apparently have more expansion, and consequently conduct air with less drop in pressure than more rigid hoses."

**G**YPSUM is selling for use as land plaster at an average rate of \$7 per ton, unsacked, in carload lots, at most main-line points in the United States. The raw gypsum is ground so that about 60% will pass a 100-mesh screen. Gypsum occurs widely scattered throughout the country in deposits that often are not capable of being developed on a large scale, but which could be utilized for the local agricultural demand. The erection of suitable mills is not very costly, and the same plants would be available also for grinding limestone as a dressing to cure acidity and to loosen up soils heavy with clay. Many chemical plants in the country are utilizing their grinding equipment for producing ground limestone, which now sells at about \$4 per ton at the larger dis-

tributing centres. It is generally pulverized so that 60% will pass a 200-mesh screen. An increase in the use of pulverized limestone is a marked tendency of recent agricultural practice.

CHEMICAL industry received prominent advertising at the recent exhibition in New York. A brief comment upon the presentation made is furnished us by Mr. M. W. von Bernewitz, which is printed in this issue. From this it will appear what great forward strides are being taken in applied chemistry by this country. We might take a divergent view from that expressed by our correspondent concerning the propriety of utilizing such an exposition to reveal the resources of the southern States. It is surely as important to make known available raw materials as to show what advances have been made in utilizing them. The object of the Chemical Exposition was to stimulate national development. The Southerners may have occupied a large amount of space, and if it appeared disproportionate in size it would indicate that other districts had neglected a valuable opportunity.

SURREPTITIOUS exportation of tungsten continues. Important arrests have been made in New York of parties engaged in this illicit trade, and some of the metal was recovered. The work of the Federal authorities in breaking up the ring responsible for this violation of the President's proclamation is said to be equivalent to the sinking of ten submarines. We can easily believe it. Shipments of tungsten, molybdenum, and nickel to Scandinavian ports for transmission to Germany have been continuous for the past three years. Every conceivable device has been employed for evading the British restriction upon contraband. Travel to Scandinavia increased enormously, and semi-manufactured cotton and rare metals were regularly taken in the baggage; women went oftener to Norway and Sweden than was seemingly necessary or safe, and a spirit of chivalry protects a lady's baggage from impertinent scrutiny; barrels of pork were not all meat, and much of the tobacco was incombustible. Americans of high standing were among those accused of falsifying invoices, and some of them were active buyers of tungsten for certain well-known German firms that apparently had millions available for accumulating these supplies in their warehouses. Members of these firms were prominent 'pacifists,' and openly announced that they were hoarding the metals to prevent their use for purposes of war, although these same concerns were on the British lists as violators of the embargo. Evidently the war, in their eyes, was a crime only when directed against Germany. Furthermore, these firms were active in trying to secure the passage of a bill to place a high protective tariff upon tungsten at a time when it would have been useful to them in helping to prevent the importation of this article from British ports, after it was found necessary for England to relieve the market here in the interest of speeding the manufacture of munitions and machinery.

## Grinding Ore for Flotation

In the working out of the problems presented in the fine grinding of ores for flotation there exists, perhaps, a larger opportunity to reduce the costs of milling than is to be found in any other branch of the art. Fine grinding is beset with difficulties, and therefore the experience at every important plant, when studied and discussed by a competent technologist, is notable. For this reason the article on the milling of the ore at Miami, by Mr. T. A. Rickard, which appears in this issue, will make an exceptionally wide appeal to mining engineers. The subject is treated in great detail, and the able metallurgists responsible for the economic results obtained have been frank in their confession of the difficulties met, and have supplied elaborate data showing how they were overcome. At Miami, as at many other great mills that have been erected since mammoth treatment-plants have become the vogue, the original estimates of capacity for the crushing department were not realized in practice. The reason lies not in lack of engineering skill on the part of the designers, but in the special difficulties presented by the ore drawn from any particular deposit. A test-mill suffices to indicate the general plan of treatment that will lead to success, but the scheme of a pilot-plant is rarely capable of being followed exactly in the works finally erected for reduction on a larger scale. Moreover, the products obtained when milling thousands of tons daily seldom conform in character and proportion to those derived from a plant treating only a few hundred tons. At Miami the mill had been running for a considerable period before the most desirable method of crushing was ascertained, and extensive changes in plan and equipment were then made. Even now further changes are in prospect, for, as Mr. Rickard pertinently remarks, "a progressive management knows no such thing as completion."

The comparison at Miami lay between rolls, Chilean mills, and Hardinge mills. The Hardinge in this case yielded the more advantageous product. Rolls are perhaps the most efficient granulators made, but their special province is restricted to crushing dry unless the ore is exceptionally free from clayey, or, more broadly speaking, colloidal substance. On the other hand, while rolls tend to choke, as they did at Miami, from too large a percentage of primary colloids, they do not produce as much secondary colloidal material as results from the wet-grinding of ore in other types of comminators. This is partly for the reason that the time of contact is brief, partly because the method of applying the crushing force involves no shearing, and finally because trituration is entirely avoided. It is interesting to note that the ball-mill, as exemplified by the Hardinge machine in the trials made at Miami, yielded appreciably less pulp of minus 200-mesh size than the Chilean mill. This indicates less abrasion. Although pre-eminent as a comminutor, the ball-mill nevertheless appears to be essentially a granulator. It is a moot point, since practition-

ers differ in their opinions, but it seems that the effect in a ball-mill is due mainly to what has been called 'radial crushing,' in which respect it resembles the action of rolls, differing, of course, in many respects in the mode of application of that principle. Crushing by impact no doubt takes place to some extent in ball-mills, especially in those adapted for relatively coarse crushing, but the load of balls at any moment is an exceptionally rigid mass, and is caused to move only by disturbance of the equilibrium when the mill is revolving. The result, then, is a tendency on the part of each ball to rotate around its neighbor. The ore-particles gripped between the balls are reduced as if caught between the cylinders of opposing rolls. Within the mass of balls there can be no impact of one against another, and the moment that shearing might come into play it would be a case of ball cutting ball rather than of the abrasion of ore-particles. Whatever be the explanation of the crushing-effect in the ball-mill, it is evident that less slime is produced than when the work is done in a Chilean mill. It is not a question of relative merit as crushing devices, but of the kind of product desired by the metallurgist for securing the best possible recovery of metal, and the difference may reside to a large extent in the peculiarities of the ore undergoing treatment. If clay were an abundant constituent, and it were important to eliminate this as rapidly as possible from the crusher, it is conceivable that the Chilean mill would show superior adaptability.

The object at Miami, as at all plants where ore is ground for flotation, is to produce as large an amount of exceedingly fine material as possible. Mr. Rickard points out that the decrease in the proportion of sulphide remaining in the tailing at Miami accurately follows the curve of decreasing size of the particles "until below 200-mesh the recovery of sulphide is seen to be reasonably complete, and the cause of the loss in the tailing becomes due predominantly to the inability to save the oxidized mineral." Mr. Gottsberger states that his aim is "to produce the maximum amount of material between 60 and 200-mesh." The product finer than 60-mesh shows 60% under 200-mesh, and although 30.9% of the total pulp, or 45.5% of the minus 60-mesh, is classed as 'slime,' it is certain that an extremely large proportion of this is actually granular, and hence would be specially well adapted to yield a high recovery of the sulphide by flotation. The significance of this is that sulphides reduced so fine as to approximate the condition of suspension-colloids, as distinct from gel-colloids, are peculiarly amenable to successful treatment by flotation, since they are readily taken up and held in the interface between the oil and water. The presence of gel-colloid, apart from any influence it may exert in emulsification, is a deterrent, shrouding the mineral particles, and preventing them from reaching the interface where they would be held and lifted to the surface by the bubbles. The action of the ball-mill, as shown in the operation of the Miami plant, is interesting in this connection. It has yielded a higher degree of comminution with the production of a less amount of slime.

## An American Peace

The new Liberty Loan is making progress, but it is being subscribed at a rate that reveals a thoughtful sacrifice by many patriotic investors. This is really better than tempestuous enthusiasm, for emotion is fickle, while serious thought develops a purpose that will reach through to the end. The people who are using paper and pencil to figure out how much they can spare are getting into their systems the inflexible determination of the old patriots who knew no compromise with the principles of liberty set forth in the Declaration of Independence. These are the kind of men who will translate their convictions into action, who will literally see it through, and not finish by writing an interesting letter, as did Mr. Britling. Secretary McAdoo gave the people an energizing doctrine when he said, "I do not believe in compromise with enemies." Neither will the men and women who are giving their sons for the contest and then following that supreme sacrifice with a further yielding of ease and comfort by figuring how much they may abstract from their incomes in order that the Government may sustain the young men who have gone to deliver the iron message of America to the German people. No; there will be no compromise! No politician would dare to misinterpret the wills of these men and women who are making sacrifices for America and American rights, by trifling with the Teutonic scourge; the War must go on until that is forever obliterated. This means more than a 'German peace,' more than acceptance of treaty pledges from a German nation. America will see it through, and will pay the bills with all the resources at its command. It is one of the most useful things for the revitalizing of that old-fashioned American spirit, which nearly had been emasculated by the pacifists, that the Liberty Loans are issued as popular loans, not subject to the manipulations of Wall Street, but available at par, without financial jugglery, to every citizen. It introduces a personal relationship to the Government that carries with it the sense of personal responsibility and the feeling of personal control that are inseparable from the act of paying the cost of national administration consciously and directly. That is the peculiar merit also of the direct tax, with which our people will soon become familiar as never before; and after the national experience with popular loans, and personal contributions, and bitter warfare for our principles, we may turn out a better democratized people, and prove in the future less open to the chicanery of politicians who thrive on general ease-loving habits and political indifference.

This loan is working for our political uplift, and it is being subscribed with an intelligent sense of its high significance. Nevertheless, the forces of newspaperdom are operating still against the spirit necessary for strengthening our military programme and for making it effective. Perhaps they are doing it unconsciously; they forget a higher duty in performing their function as purveyors of news; the evil is apparent on both sides

of the Atlantic. The news agencies of England are equally reprehensible. The dispatches from London, based upon messages that tell of German uprisings and mutinies and the threatened degradation of high officials, have not modified the poison that was sent from Berlin to blind and befuddle the world and to beguile us into inaction. Can anyone be so simple as to suppose, if he but pause and think it over, that any information derogatory to Germany, indicative of internal treachery and the peril of imperial collapse, could be published in that country and allowed to find its way through the tightly contracted censorship of an autocratic military power into the countries arrayed against it, unless every word had been carefully prepared with a view to its psychologic effect? If this were not so, then we would be obliged to admit that the Kaiser was puerilely advertising the tottering of his authority. It is too soon for that, though it must come in due season. The entry of America into the War has listed the downfall of Prussianism among pre-destined events. We may consider it stupid to send out such dispatches, whether true or false, for they must in turn exert an influence upon the German mind. The Teutonic leaders have displayed a vast amount of childish simplicity in their misjudgment of the intelligence of other people, and also sometimes of their own. The stupidity of these dispatches may be partly intentional, but it is not wholly so. It would be well if our news-gatherers should so handle the misinformation transmitted from Berlin through Amsterdam as to make clear the intentional as well as the unintentional stupidity in them.

The purpose of the game is to arouse anticipations of an early peace, so as to slow down our preparations. After months of exasperating performances of this character, and after repeated warnings by prominent men returning from Germany that such events would be heralded in order to make our military activity seem unnecessary, President Wilson has at last urged the people of this country to disregard these rumors. He should go further; he should request the newspapers to pass dispatches from such untrustworthy sources through the hands of officials who, by proper editing, would render them innocuous. No newspaper is so un-American as to disregard the expressed wish of the President in any matter pertaining to this War. We are ready to buy bonds, we are determined to sustain the Government, we are sending our sons to the front, but on account of the misinformation disseminated through the press we are talking a great deal too much about an early peace. Our present supremely urgent business is war, and we had better talk about war. An arctic explorer who should start from his base on the northward trudge over the forbidding snow-fields, and should persistently talk about the final homecoming, would certainly fail of the inspiration that would carry him through to the Pole. One way to help win the War is to insist upon grim determined fighting. Very likely the Germans are tired of the War; beyond doubt Kaiser Wilhelm would have been a less blustering war-lord in

1914 had his foresight been as good as the hindsight now possible over a fruitless triennium of slaughter; but Germany has not yet been sufficiently punished, and our soldiers are needed at the front to make the correction permanent. The dispatches from Berlin must be read in the light of the Teutonic estimate of Americans as silly fools, and until the Kaiser sends a plea for mercy direct to the Allied Governments we must recognize that he still hopes for some form of a 'German peace.' We ought to print on every bond "No compromise!" and then go on until we can dictate an American peace.

## Copper Producers Combining

Copper production has fallen off. No other result could follow from the double embarrassment of obstreperous labor and an indecisive Government. The decrease of 45,000,000 pounds of copper per month during August and September is not surprising under these circumstances. The slump will become more precipitous unless wise steps be taken promptly. The action of the copper producers, under the marshalship of Mr. Joseph Clendenin of the American Smelting & Refining Company, in arranging what the market denominates a 'pool,' is a necessary step in the direction of self-preservation. The copper producers have borne the brunt of increasing difficulties, and the outlook promises more stress of weather. As we pointed out recently, in discussing the labor situation, ceaseless agitation, interrupting operations and lessening the will and efficiency of the workers, coupled with an actual shortage of men, is a matter of national concern in view of the fact that the demands of this Government and of our European Allies henceforward will exert a tremendous pressure upon the capacity of the copper mines. Certainly co-ordination of effort is requisite if the problem is to be met with hope of solving it. The committee on distribution, which has just been formed in representation of the producers, has frankly admitted that what it proposes to do, and must do to save the situation, is technically in violation of the Sherman Act. In these times of mammoth combination of industry, under Government sanction and by its direct intervention, for the sake of directing production and stabilizing prices, it is almost a shock to be reminded that a Sherman Act stands lonely and forgotten on the statute books. We imagine that the Government will find some convenient means by which it may adapt this committee as a useful wheel into its War-mechanism, and we hope, in the interest of plain people who must buy a few things made of copper and brass for general use, that the proposed committee of consumers, being organized to co-operate with the producers' committee, may receive official recognition. Surely in some manner it should become known whether outsiders may or may not have copper, and whether they may have it at 23.5 cents or at some other price. The Government needs to take decisive measures or empower those to do so who are best informed in regard to the conditions of production and the needs of the domestic market.

## Mill-Tests v. Hand Sampling

The Editor:

Sir—Contributions to the MINING AND SCIENTIFIC PRESS on the subject of mine-sampling appear continuously and certainly few, if any, subjects in the technology of mining are more worthy of attention. The following are some of the impressions of a man who has been more engaged in the management and development of mines than in inspecting and reporting on them, but who has also done and seen a considerable amount of such work.

Much has been said as to methods to be adopted in sampling, that is useful and necessary. These are the outcome of applying experience and common sense. It seems to me, however, that there is a tendency to overrate the applicability of particular methods. I submit that knowledge of methods is not sufficient in a man appraising the value of a mine. Probably no competent engineer would say that it is. I submit, however, that the mere knowledge of methods falls much further short of fulfilling the requirements than appears to be generally accepted. I affirm that the primary requirement in appraising the value of a mine is an understanding of the deposit itself. This diagnosis having been made, as correctly as available data and the ability of the man permit, the method to be adopted should then be a matter for consideration in the light of experience, of common sense and of the facilities and money available for the work.

There has been much discussion as to the respective merits of bulk-sampling, that is, sampling by means of actually treating certain tonnages of the ore, as against sampling by means of considerable numbers of small samples taken according to certain methods. Personally I have no doubt as to the usefulness of treating large tonnages of the ore, except in certain circumstances. Those circumstances apply in the case of ore formations of a very homogeneous character and on which other mines have already, by actual operation, shown the characteristics of the ore under treatment, and have also proved the efficacy of certain methods of sampling to arrive at the metallic content of the ore. Obviously the appraising of such mines is a simple matter and can be effected by the application of rule of thumb methods of sampling, and at no great cost compared with the size of the deposit sampled, supposing, of course, that they are developed to a reasonable extent. Such cases are not those that call for discussion; nor are they the ones which

present difficulties or call for initiative or a very deep understanding of ore deposits. It is the case of deposits outside of such circumstances of which I now write. To deal, then, with the appraising of deposits where the problems presented are fresh ones, it will be agreed that, from the point of view of appraising the character of the ore metallurgically, that is, what the recovery and the cost of treatment will be, the treatment of considerable tonnages of ore, taken from the mine so as to be as fairly representative of the whole deposit as may be feasible, is invaluable. It may be costly to effect, and in many cases impossible. If it can be done it is undeniably most useful, as the recovery and the cost of treatment are fundamental factors in the value of the ore, which value is the profit obtainable from it.

Even, however, from the point of view of ascertaining the metal content of the ore, the treatment of certain tonnages judiciously chosen is most valuable. For instance, information given by the treatment of the whole of the ore coming from particular headings such as drifts and winzes, accompanied, of course, by continuous sampling at the treatment-plant, is certainly much more complete and reliable than that obtained by sampling the sides by any method based on a number of small samples. In the one case the whole of that portion of the deposit represented by the particular headings actually has its full metal-content accounted for. In the other case the same portion is merely sampled by methodical scratching around it. Whether all the circumstances would justify such treatment of the ore, or of ore broken from selected spots, if it be unavailable from the headings, is another matter.

Every mine or deposit should be judged on its own merits as to the manner in which it should be sampled and to what extent sampling should be carried out. In diagnosing cases for this purpose many factors come into play, the degree of regularity in the distribution of the metal and the facilities for carrying out bulk-sample tests, the history of the mine, and the like. The mine record is most informing if known in reasonable entirety, and especially if the reasons underlying the scheme of past operations are known. In some mines I have preferred sampling the trucks or kibbles as they have come from development work to a sampling of the faces. In these cases the treatment of all the ore from the development was not feasible. In other mines I have found that sampling of the development-faces by the usual method of cutting strips across gave satisfactory results. The former method is feasible only while development is

progressing and is not to be effected by an engineer whose time is limited to a visit. Dump-sampling may or may not partly take the place of such sampling, according to circumstances. Where it is decided that face-samples are to be utilized for valuation, I submit again that there is no rule to guide the method of taking them. The degree of homogeneity in value and in hardness, the variability in width, the degree of regularity of outline, and so on, must be carefully considered in deciding on a plan. The stereotyped taking of sections across the run, or what may be considered the run of the ore at certain spaces apart, by no means meets all conditions. To give examples of different circumstances which would indicate special methods of sampling would be too lengthy. My contention is that it is the man, and his general grasp of essentials, including the significance of results from sampling when obtained, that is the main thing, and not knowledge of methods, as such.

I will, however, say a word regarding the face-sampling of ore of a kind I have often seen quoted as presenting a difficult sampling problem. I allude to cases where the ore is variable in hardness and where either the harder or the softer part, more frequently the latter, is much richer than the other. Most engineers have dealt with such ores. The difficulty is that in cutting out a section the jarring causes a lot of the softer material to fall from the ore alongside of and behind the section. The problem is to get the hard and the soft portion of the ore represented in proper proportions in the sample. I would suggest in such a case that before the sample is taken the face should be subjected to a jarring similar to that which it receives during sampling, that a wide strip be cut, and that a rectangular receptacle, say a box, of the same or of a less width than the strip, be used. If such a box be used, one side being kept parallel to the length of the strip, and care being taken that no part of the box is held outside of the limits of the strip, then little or none of the ore shaken from outside and alongside of the strip by the jarring should go into the box. These precautions practically dispose of error due to softer ore from the part outside and alongside of the strip taken. With regard to the amount of softer ore which would fall from behind the strip, this should be counterbalanced by the amount of the same which had previously been jarred from the strip. As a matter of fact this effect is achieved to some extent in the work of making the excavation, the face of which is being sampled. The explosions and picking will have jarred out much of the softer ore, leaving on the outer surface a depth composed of a larger proportion of the harder ore than was the case originally. This last fact and the additional use of preliminary jarring has, I think, been often overlooked in considering the correctness of sampling in ore of the above description.

I have seen advocated a method of sampling faces by means of boring holes in them. In ore with the metals fairly well distributed, this should give reasonably accurate results. The few inches at the collar will be unduly represented and in a fairly long hole the amount of

drillings would be 50% greater per inch a few inches from the collar than at the bottom. The conditions thus differ considerably from the rules laid down for sampling faces in sections, if all the drillings from a hole go into one sample. This can be met by the division of the drillings into separate samples as the boring proceeds, say into sections of one foot each.

This method has been recommended, or stated as having been used, for cases where the hardness varied and the metal-content of the ore varied with the hardness. Where the softer part of the ore is of a crumbly nature, this method would result in considerably more of the softer part going into the sample than should be allowed. The jarring of the drilling would shake out a quantity of the softer ore from parts around the hole. In any case the hole would generally cut somewhat larger in the soft parts than in the hard parts. The effect of jarring out crumbly ore from around the hole would apply particularly if percussion drills were used. If done by hammer drills or by hand-drilling the effect would be less, but might still be considerable. In this case one would expect more accurate results from rotary drills, if it were feasible to use them. Even then any crumbly parts might be too largely represented in the drillings. Cores would probably represent such parts insufficiently.

I have never myself utilized this method of sampling and cannot speak from experience as to its reliability. I have utilized the boring of holes for exploratory purposes, to see what ore existed beyond the exposed faces, but that is a different thing. This was seeking general information, not results upon which to calculate values. I am satisfied that the difficulties of securing a representative sample of the immediate spot being taken can practically always be overcome by intelligent consideration of the problem, though perhaps with trouble and expense. In irregular deposits any scheme of sampling must be recognized as giving at the most only reasonably accurate indications of the average value of the exposed faces, and that the unexposed parts may be richer or poorer than the sampling indicates. It comes back to the fact that sampling is only one of the instruments used by a man with a sound grasp of his work, certainly an essential instrument, but in itself insufficient to indicate the probable worth of a mine. The intelligence and experience to observe and interpret other data and to recognize the most probable meaning of sampling results is necessary. Perhaps some will think this so obvious as to be unnecessary to say. I believe that it is not obvious to all, and is so important that it is worth the saying even at the risk of superfluity.

H. R. SLEEMAN.

VANADIUM combines with both oxygen and nitrogen in molten steel at high temperature, eliminating them.

# Miami, Arizona: The Milling of the Ore—IV

By T. A. RICKARD

**CRUSHING-PLANT.** A part of the Miami mill went into operation on March 15, 1911. It was designed by H. Kenyon Burch (State College of Washington, '01). From the No. 4 shaft the ore is delivered to the coarse-crushing plant, which, as planned originally, consisted of two No. 7½ (Kennedy) gyratory crushers, breaking the mine-run to 2-inch cube, without return, the crushed ore passing to two 4 by 10-ft. trommels equipped with manganese-steel screen-sections having ¾-in. round holes. The oversize of these trommels was delivered to two 54 by 24-in. Traylor rolls, intended to reduce the ore to ½-in. cube.

While this arrangement seemed ideal on account of its simplicity, it failed to produce the degree of fineness desired. An improvement was brought about by making several changes. A small grizzly was placed before the gyratory crusher so as to remove the fine stuff, already sufficiently reduced. The chief fault, however, of the coarse-crushing plant was the inability of the rolls to furnish a uniform product. When the faces of the rolls became worn they were so corrugated as to yield a large proportion of oversize. With a 2-inch feed such corrugation seemed inevitable. The only way to obtain a suitable product was to re-grind. Therefore the product of the two 54 by 24-in. rolls is now (see Fig. 1) elevated to two 4 by 7½-ft. trommels with ¾-inch holes, the oversize from which goes to two 42 by 16-in. spring-rolls, making a closed circuit, so that only the undersize from the trommels goes into the mill. Today the product from the coarse-crushing plant contains only 1% that remains on a ¾-inch screen and 10.9% that remains on a ½-inch screen. The crushed ore is delivered through chutes leading from the trommels to a traveling belt, which already has carried over 7,000,000 tons. It was made by the New York Belting & Packing Co. It has a width of 30 inches and moves at the rate of 411 ft. per minute. For 256 ft. it has an incline of 16°30' and then delivers the ore to a horizontal belt 329 ft. long, passing over the mill-bins. The distribution of the ore is effected by a tripper. A weighing-machine (the Merrick weightometer) keeps a record of the supply.

**ORIGINAL MILL.** The mill is divided into six sections, each of which is provided with a circular steel bin of 1000 tons capacity. In May 1911, three months after the start, the first three sections were in operation, treating 39,657 tons during that month. From each bin the ore was fed by a shaking feeder to 42 by 16-inch rigid rolls designed by Mr. Burch, who had provided a device whereby one roll-face moved across the other so as to prevent corrugation. It failed mechanically because the

pressure upon the two faces in contact was so great. At this stage the reduction was supposed to be to ½-in. cubes. This result was nearly obtained, only about 2% failing to pass through a ½-in. round hole. The rigid rolls, however, proved too light for the work required, and on account of the high cost of maintenance were replaced by an extra heavy type of spring rolls specially designed by the Traylor Engineering Co. The original flow-sheet provided for a wet feed to these rolls and for

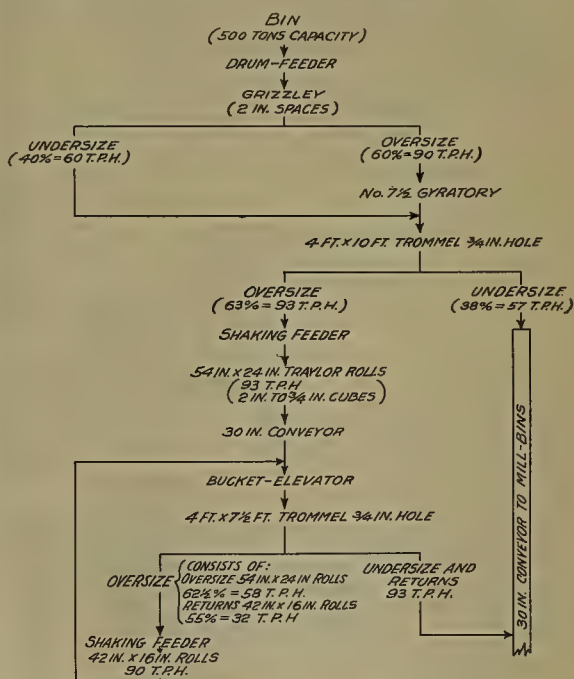

FIG. 1. FLOW-SHEET OF ORE-CRUSHING DEPARTMENT

the removal of some of the fine by means of a shaking launder, fitted with a perforated steel plate where water was added, but it was found in practice that the rolls did better work on a dry feed, so that later the water was added below the rolls.

The product from the rolls was divided into two parts, each of which passed over a duplex Callow screen, having openings of 0.026 inch, equal to about 26-mesh. See flow-sheet, Fig. 2. The undersize from each screen went to a drag-belt dewaterer, while the oversize passed to a 6-ft. (Saturn) Chilean mill provided with a screen having 0.024-inch openings, equivalent to 28-mesh. The product of the Chilean mill joined the undersize from the Callow screen at the dewaterer, the overflow from which went to the slime-plant while the sandy product

from the dewaterer went to a 10-spigot launder-classifier equipped with the Richards hindered-settling device. Each of the 10 spigots served one No. 2 Deister sand-table. The middling from the first six tables on each side was fed to a 6-ft. Hardinge pebble-mill, the product going to two No. 2 Deister tables, which re-treated this re-ground middling from the first Deister tables. The middling from the last four Deister tables on each side was re-concentrated, without re-grinding, on a No. 3 Deister slime-table. That finished the sandy product; we turn now to the treatment of the slimy product.

The overflow from the dewaterer and the overflow from the launder-classifier joined in their passage to one 8-ft. cone-tank. The underflow (or spigot product) was divided into six parts and fed to as many No. 3 Deister slime-tables. The overflow was distributed to eight 8-ft. cone-tanks, the thickened product from these being treated on eight No. 3 Deister slime-tables. The overflow was used as returned water. The middling from all the slime-tables was re-treated without re-grinding on two No. 3 slime-tables.

Such was the scheme of water-concentration. The re-

sults were as follows: From a feed averaging 2.46% copper there was obtained a concentrate of 39.69% and a tailing of 0.688%. Thus the recovery was 71.8%—a result fully up to the standard reached at that time—six years ago—on a disseminated-chalcocite ore.

CHANGES. The screen of the Chilean mill was changed to 0.029 and later to 0.037 (say, 18 mesh), partly to gain capacity and partly to promote durability. As B. Britton Gottsberger, the manager, said in his report of January 1, 1913: "It was found necessary to sacrifice metallurgical efficiency for mechanical reasons." Coincidentally No. 4 section was equipped with three sets of 42 by 16-inch rigid rolls, instead of Chilean mills; but the experiment proved a failure, because the capacity of the rolls was insufficient when crushing wet. After the failure of the rolls in No. 4 section, an 8 ft. by 22-in. Hardinge mill was tried in competition with the Chilean mills. This was in July 1911. The immediate result was a telegram stopping the shipment of another type (Evans-Waddell) of Chilean mill already ordered and the purchase of three Hardinge mills for section 6, besides 10 more Hardinge mills, one to be placed in section

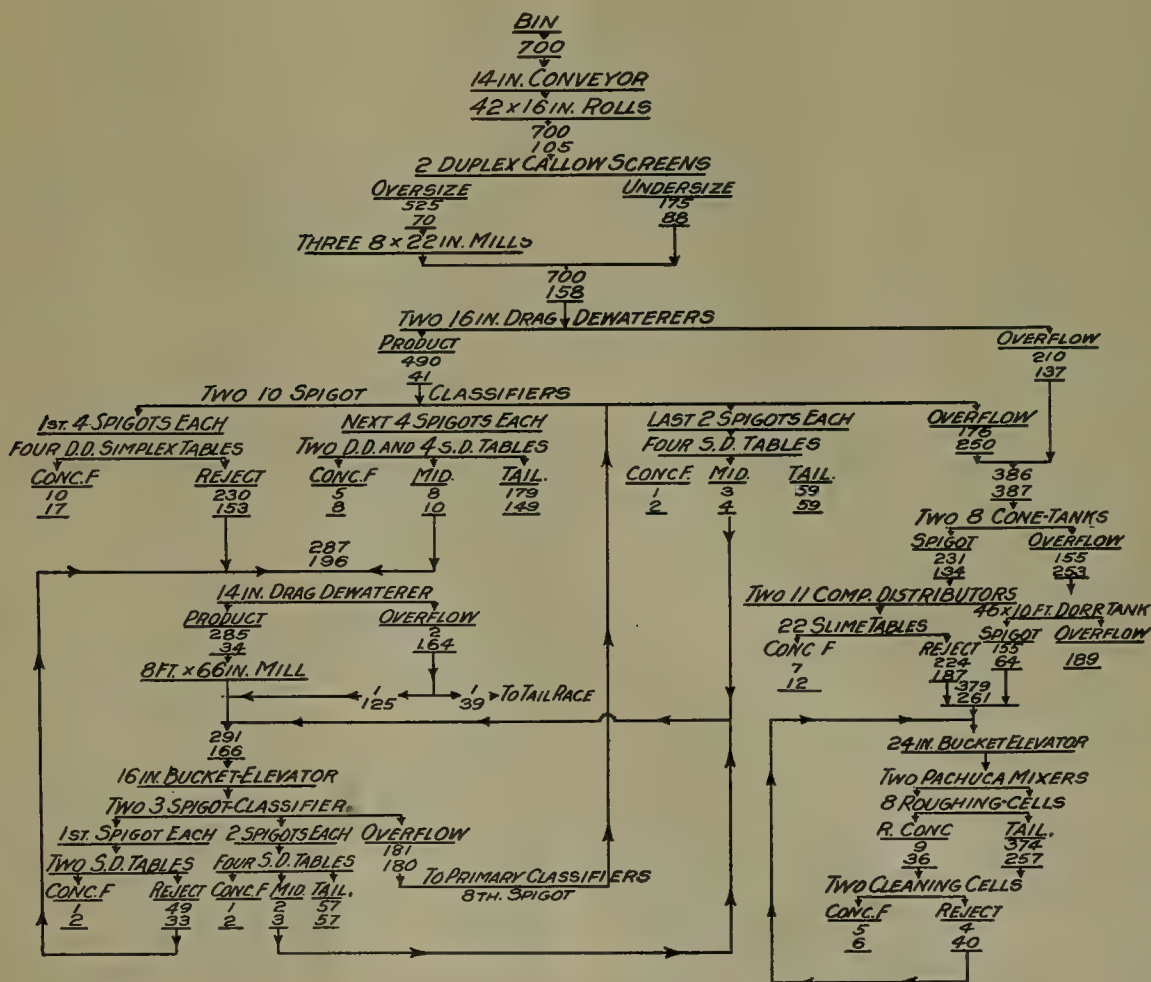

FIG. 3. FLOW-SHEET OF SECTIONS 1, 2, AND 4. SEPTEMBER, 1915

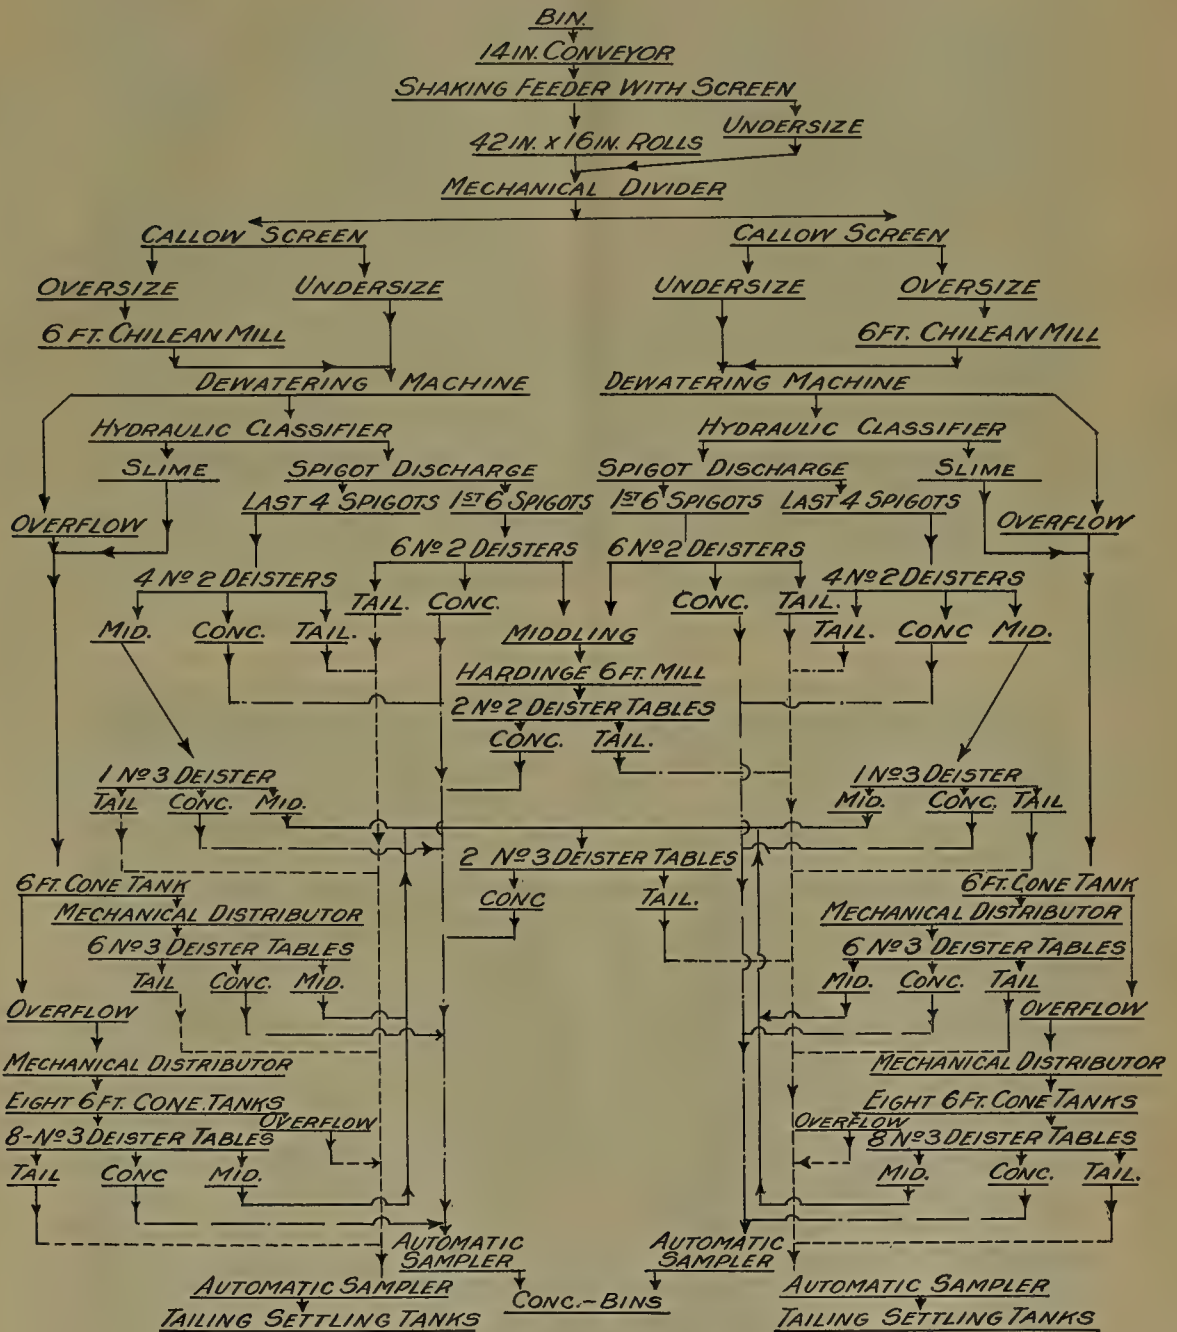

FIG. 2. FLOW-SHEET OF ONE CONCENTRATOR UNIT. MARCH, 1911

4 and three each in sections 1, 2, and 3. In the report already quoted, Mr. Gottsberger gave a tabulation of screen-analyses showing the work done by the Hardinge and Chilean mills, both taking the Callow-screen oversize from the rolls; I quote it herewith:

Mesh	—Hardinge mill—		—Chilean mill—	
	Feed	Product	Feed	Product
+ 4 .....	12.9	0	13.9	0
+ 10 .....	47.3	0	47.5	0
+ 20 .....	26.8	0.2	22.9	2.3
+ 30 .....	5.0	3.2	5.2	11.8
+ 40 .....	0.8	4.9	0.9	6.7
+ 60 .....	0.8	13.8	1.0	11.4
+ 80 .....	0.4	10.4	0.5	6.7
+ 100 .....	0.3	8.6	0.4	5.4
+ 150 .....	0.3	8.0	0.5	6.3
+ 200 .....	0.5	10.0	0.7	7.2
— 200 sand .....	0.8	10.0	1.2	10.6
— 200 slime .....	4.1	30.9	5.3	31.6
— 200 total .....	4.9	40.9	6.5	42.2

Mr. Gottsberger said: "Inspection of these shows at a glance that the Hardinge mill as a grinding-machine for the purpose we aim at is the more efficient. Our aim is to produce the maximum amount of material between 60 and 200-mesh, avoiding sizes both above and below these limits. By this standard it is found that the Hardinge mill produces 22.1% plus 60-mesh in comparison with 32.2% for the Chilean. Of material between 60 and 200-mesh, the Hardinge mill produces the larger amount, showing 37% in comparison with 25.6% for the Chilean, while on material under 200-mesh, the Hardinge mill here shows the lower amount—40.9% as against 42.2. It is thus evident that as a grinding-machine the Hardinge mill is far in advance of the Chilean." Further, he pointed to the fact that where the mill-sections equipped with Hardinge mills needed only 172 gallons of water per section per minute, the sections containing Chilean mills required 290 gal. per min. Another feature was the effect of the fine slime upon the cone-tank overflow. The lower cone-tank overflow carried 19.9 tons of solid per section per 24 hours where Hardinge mills were at work, while the Chilean sections averaged 75.1 tons. As regards capacity, Mr. Gottsberger stated: "In the case of the Chilean mill, as the size of the product depends upon its passage through a screen, the capacity can be increased by forcing the machine, without any change in the size of the material delivered. This gain in capacity, however, is limited, and is accomplished only at the cost of an abnormal power-consumption. In the case of the Hardinge mill, for a given quality of feed, only a certain amount can pass through the machine and this will be governed by the quality of the product desired. The capacity of the Hardinge mill will vary possibly to a greater extent than the Chilean with different percentages of fine material in the feed. We have found in practice that with two Saturn mills, a section will handle about 480 tons per day with a power-consumption of about 150 hp. By overloading the machines, between 500 and 600 tons per day for two mills can be obtained, but at this rate the power-consumption

will rise to 175 hp. or over. In comparison with this we find that with three Hardinge mills and our present intermediate-roll product, a section-tonnage in excess of the 500 tons per day can be obtained with a consumption of about 140 horse-power."

**OXIDIZED ORE.** Thus was brought about a series of mechanical changes. The capacity of the mill was increased from 500 tons per unit to 700 tons. The copper in this ore was in two diverse conditions, sulphide and oxidized. This fact influenced not only the water-concentration, but the froth-flotation that came at a later stage. At the time of which I am now speaking, at the end of 1912, the copper was divided between the sulphide (chalcocite, with a little chalcopyrite) and the oxidized minerals (chrysocolla, malachite, and azurite) in the proportion of 83:17. Of the total copper recovered by milling, 93% was in the form of sulphide and 7% oxidized, whereas the loss in tailing was distributed between 61.7% sulphide and 38.3% oxidized. In short, the recovery of sulphide copper was 76.8%, whereas that of the oxidized was only 28.8%. Thus the success of the milling varied inversely to the proportion of oxidized mineral in the feed. Of the sulphide, 66% remained on the sand-floor, as against 36% of the oxidized copper. On the slime-floor the ratio was 34% of sulphide to 64% of oxidized. It was evident therefore that in the course of the successive crushing operations the oxidized minerals tended to collect in the slimed products, where the recovery of them was difficult, and, in fact, of relatively small consequence. On the other hand, of the oxidized copper going to the sand-floor, 58% was recovered, as against 12% on the slime-floor. This relation was confirmed by the assays of the tailing, showing that of the total loss of copper in oxidized form, 21% had to be debited to the sand-floor and 79% to the slime-floor.

A test made between a Wilfley and a Deister multiple-deck table showed a recovery of 46.4% on pulp assaying 1.785% copper by the Wilfley, as against 46.1% on a feed of 1.578% by the Deister. The tailing from the Wilfley contained 0.954%, whereas the Deister tailing contained only 0.875% copper. An experiment was made in lengthening the cylinder of a 6-ft. Hardinge mill from 22 to 38 inches. This proved advantageous. One long mill re-ground as much as two short ones. It was found advisable to re-grind the sand in a Hardinge mill, following this by classification before re-treatment on Deister tables. A test-run showed that the tailing could be reduced to 0.47%. Thereupon, a new flow-sheet was planned; but shortly afterward, in June 1913, the possibility of using flotation as an auxiliary process had to be considered, in consequence of the experiments made at the Inspiration mine. These experiments were confirmed at the Miami mine in January 1914, when an agitation-machine was used with encouraging results.

**RESULTS.** Before proceeding to describe the introduction of flotation, I shall quote figures indicating the results obtained during the past five years:

HORIZONTAL BELT AND TRIPPER DELIVERING CRUSHED ORE INTO MILL-BINS

ROLLS AND HARDINGE MILLS, HEAD PULLEY OF DRAG DEWATERER AND HEAD END OF CLASSIFIERS

Tonnage	Feed, %	Concentrate, %	Tailing, %	Recovery, %
Jan. 1913.. 92,615	2.33	37.13	0.699	71.57
Jan. 1914.. 102,497	2.31	39.97	0.747	70.05
Jan. 1915.. 60,115 <sup>a</sup>	2.22 <sup>a</sup>	40.08	0.655	71.67
Sept. 1915.. 121,713	2.21 <sup>a</sup>	44.16	0.462	79.94
Jan. 1916.. 123,866	2.19 <sup>a</sup>	41.64	0.628	72.47
Mch. 1916.. 141,272	2.09 <sup>a</sup>	42.40	0.533	75.48
Jan. 1917.. 171,882	2.15 <sup>a</sup>	43.14	0.592	73.48

<sup>a</sup>Curtaiment due to the War. <sup>b</sup>Oxidized, 0.363%. <sup>c</sup>Oxidized, 0.251%. <sup>d</sup>Oxidized, 0.33%. <sup>e</sup>Oxidized, 0.33%. <sup>f</sup>Oxidized, 0.247%.

During this period the cost of milling was 65.86, 57.22, 49.96, 57.94, and 58.91 cents for the years 1912, 1913, 1914, 1915, and 1916 respectively. Flotation was introduced in August 1914. The first result was to increase the capacity of the mill rather than the recovery, although that also was improved. The effort to get more ore through the mill was intensified by the rise in the price of copper, so that the tonnage treated in January 1917 was nearly 70% more than was milled in January 1914, whereas the recovery during those three years improved only 3.43%. During this interval the cost per ton of ore increased considerably, from 49.96 to 58.91 cents, because the higher profit justified a more hurried exploitation, but the cost is now being reduced, having been 51.57c. for the first three months of the current year.

**FLOTATION.** In June 1914 the attention of the Miami management was called to the Callow machine and in August of that year a flotation unit was added to section No. 5 of the mill. This new equipment consisted of four Callow roughing-cells and one cleaning-cell. Meanwhile preparations were made for a re-modeling of the mill in accordance with a new flow-sheet, shown in Fig. 3.

The capacity of the steel bins was enlarged by enclosing the spaces between the original circular bins, thereby increasing the total storage to 10,000 tons, as against an original capacity of 6000 tons. Three Hardinge mills (8 ft. diam. by 22 in. length of cylinder) were added to the grinding-machinery, replacing two Chilean mills. The launder-classifier was retained, but the first six spigots were made to feed three double-deck Deister sand-tables, the other four spigots feeding four Deister No. 2 single-deck tables, as previously. The reject from the first two double-deck tables on each side of the section, together with the middling from the first six tables, was re-ground in an 8 ft. by 66-in. Hardinge pebble-mill. The product from this was elevated to a 3-spigot launder-classifier feeding three sand-tables.

The overflow from the dewaterer and from the classifiers passed as before through an 8-ft. cone-tank (one on each side of the section), the spigot-product of which was distributed to 11 No. 3 Deister slime-tables, while the overflow from the cone-tank went to a 46 by 10-ft. Dorr thickener. The thickened product and the reject from the slime-tables passed together to a bucket-elevator and thence to the Callow flotation machines—eight roughing-cells and two cleaning-cells for each section.

That was the flow-sheet as designed three years ago;

it is the flow-sheet of the entire mill today, except that the flotation concentrate, with the concentrates from the sand-tables and slime-tables—that is, all the concentrates—used to go to a series of circular tanks provided with filter-bottoms whereby the concentrates were subjected to a vacuum, reducing the moisture to 14%. In January last, one Dorr thickener (60 by 12 ft.) and one 12-ft. Oliver filter were added; so that now the flotation concentrate and the slime-concentrate are drained in one thickener and one filter, whereas the sand-concentrate still goes to the old filtering-tanks. During April 1917 the distribution of concentrates was as follows: Sand-tables, 3809 tons; slime-tables, 1093 tons; flotation plant, 1674 tons per day. The concentrates from these three sources are of almost equal grade, ranging from 41.94 to 42.79% copper.

**STEEL BALLS** were tried, in the place of pebbles, during April 1915; the use of these in all the Hardinge conical tube-mills was adopted throughout the plant in the August following. A comparison made at that time showed:

	Balls	Pebbles
Tons treated per day per section.....	814	650
Percentage of material larger than 48-mesh in the product .....	14.8	20.7
Tons of + 48 material in the product.....	120	135
Tons of - 48 material in the product.....	694	515
Tons of - 48 material produced per hp-day..	4.63	3.43

The same power was consumed in each case, namely, 150 hp. Two mills ran with balls against three with pebbles. The chief gain, obviously, was the increased grinding capacity. Two-inch 'manganoid' balls, made by the Jeffrey Manufacturing Co., are now used in the Hardinge mills; the size of the balls should vary with the maximum feed—the finer the feed the smaller the balls.

**FURTHER CHANGES** will be made in the mill, for a progressive management knows no such thing as completion. Experiments having demonstrated that iron balls are more effective than pebbles for grinding in Hardinge mills, the ore will be fed from the bins into an 8 ft. by 30-in. Hardinge mill supplied with 4½-inch balls. The product will pass to a Dorr duplex 4½-ft. classifier, the overflow from which will be of finished size (- 48 mesh) and will be sent direct to the flotation-cells. The sand from the classifier will be re-ground in two 8 ft. by 30-in. Hardinge mills supplied with 2-in. balls. The latter will complete the grinding to 48-mesh in closed circuit with two 6-ft. Dorr duplex classifiers. The overflow from the classifiers passes to flotation machines of the pneumatic type, the total area of filter-bottom per mill-section of 1000 tons capacity being 431.2 sq. ft. in the roughing-cells and 107.8 sq. ft. in the cleaning-cells. The air-pipes will enter from below and the flotation unit of each mill-section will have 5000 cu. ft. of air per minute, under 5-lb. pressure, or three times as much air (per 1000 tons of dry ore) as is used today. Three Oliver filters will be provided for the entire mill (of six sections), two filters constituting an operating unit and one being held as a spare.

SINGLE-DECK DEISTER TABLES, ELEVATOR-HOUSING, AND SECONDARY CLASSIFIERS

FLOTATION-CELLS; 'ROUGHERS' ABOVE AND 'CLEANERS' BELOW

The object of the crushing and grinding is to liberate the valuable mineral from its encasing gangue so as to obtain the full effect of differential treatment, whether by gravity or flotation. The rolls tend to crack without grinding; on the other hand, the Chilean and Hardinge mills, in which the ore is exposed to a variable measure of abrasion, are better fitted to induce the parting of mineral from gangue. The defects of the Chilean mill are its small capacity, high power-consumption, and excessive use of water; moreover, it produces an excess of slime, although the sand-tailing is cleaner. In 1915 the average sand-tailing for the whole mill was 0.52% copper, whereas that of the Chilean mills was only 0.44%; but on referring to the total tailing-loss it is recorded that for the whole mill it was 0.48%, while for the Chilean mills it was 0.52%; this being due, as suggested above, to the excessive slime produced by these machines. Fine grinding is desired by the millman because it is his aim to liberate the valuable mineral. In water-concentration the production of slime was a deterrent to fine grinding because it entailed the loss of metallic mineral; thus the millman was between the devil of insufficient reduction and the deep sea of excessive slime. When, however, he was given the use of flotation the bugbear of slime was removed, because the froth floats the finest mineral most completely.

The ore from the Captain orebody of the Miami mine, and from the extension of that deposit into the Inspiration ground, contains a large amount of secondary quartz, which is readily disintegrated into angular sand; indeed, chunks that seem at first so solid as to be unbreakable without the use of a hammer, if held in the clenched fist and manipulated often will granulate and yield much sandy material when under no greater pressure than that developed by the hand. To this peculiar physical condition of the ore is due in no small part the success of the caving-systems of mining here used, and more conspicuously the cheapness of crushing and grinding the ore in the process of milling. It also helps to explain the striking success of the Hardinge mill in granulating so large a tonnage, and it renders more comprehensible the lower capacity and higher proportions of slime in the pulp coming from the Chilean mills, since the function of abrasion or shearing performed by a Chilean mill is excessive as compared with that in a ball-mill, as elucidated by De Kalb<sup>1</sup> long ago.

**OXIDIZED ORE.** The copper in the tailing after flotation is distributed as shown by the following screen-analysis:

Size Mesh	Weight, %	Total copper, %	Oxidized copper, %	Sulphide copper, %
28 .....	1.4	0.61	0.18	0.43
35 .....	4.3	0.58	0.14	0.44
48 .....	8.1	0.52	0.14	0.38
65 .....	9.7	0.45	0.15	0.30
100 .....	12.9	0.38	0.14	0.24
150 .....	12.1	0.40	0.15	0.25
200 .....	5.9	0.40	0.23	0.17
—200 .....	45.6	0.83	0.68	0.15

This shows that the coarse sizes contain relatively more sulphide, owing to incomplete liberation of the chalcocite. Going down the scale of size, one finds a decreasing proportion of sulphide and a relative increase of oxidized mineral, until below 200-mesh the recovery of sulphide is seen to be reasonably complete and the cause of loss in the tailing becomes due predominantly to the inability to save the oxidized mineral, whether on tables or in the flotation-cell. This point was emphasized when discussing the earlier flow-sheet. The oxidized ore contains a variable proportion of silicate with the carbonate. The silicate accompanies the gangue during concentration and it is also difficult to leach.

A testing-plant of 100 tons capacity has been operated for the past year as a pilot for the flotation operations and of late for experiments looking for a suitable method for the treatment of mixed sulphide-oxide ore.

**FROTH-FLOTATION** is always interesting; at least, I can say that my feeling of wonder when I see the froth at work is still strong. It is a fascinating process. In the Miami mill only four-tenths of a pound of oil is used per ton of ore, or, more accurately, 2.7% of the weight of chalcocite in the feed to the flotation-plant. This oil is a mixture containing 50% coal-tar, 45% coal-tar creosote from the Barrett Co., and 5% steam pine-oil. It is added to the tailing from the Deister slime-tables on its way to join the stream of the spigot-product from the Dorr thickener.

On the roughing-cells, or first flotation treatment, the froth looks like wool; it has a dark tint, which varies, of course, with the supply of air and mineral. The surface is pitted as the bubbles break, to be replaced by others rising from below. The froth in these pneumatic machines is flimsy and evanescent but voluminous and continuous, so that the mineral is borne steadily to the surface and over the lip of the 'cell' or compartment. Any excess of oil shows itself in smooth streaks that form lines of depression along the surface of the froth, killing it. This is the 'over-oiling' effect. If the supply of air or oil is insufficient the froth does not overflow, the mineral particles drop, to meet other bubbles, rising again, falling, finally agglomerating and dropping to the bottom.

In the roughing-cell the froth is 6 inches deep; in the cleaning-cell, 16 inches. Two-inch bubbles suffice for the 'rougher,' but a few bigger bubbles, up to 6-in. diam., are liked as an evidence of slight over-oiling. In the 'cleaner' the size of the bubbles is not so important: an average of 2½-in. is liked. The air-inlet valves of the rougher are kept wide open; those of the cleaner only one-third open. However, the supply of air to the cleaner is relatively the greater because the flow of pulp is less. The roughing-compartments determine the loss in the tailing; the cleaning-compartments regulate the grade of the concentrate. The grade of this product is determined by the rate at which the froth overflows, and this in turn is controlled by the supply of air and oil. The higher the grade of concentrate, the richer the tailing; therefore the metallurgist aims to maintain the

<sup>1</sup>Ore Dressing.' Robert H. Richards. Vol. III, page 1326.

economic balance, that is, the most profitable result.

An air-washing device is to be attached to the inlet of the blower with a view to removing the dust in the air, thus preventing or retarding the choking of the canvas that serves as a porous medium on the bottom of the cell. I saw several pachucas, or Brown agitators, which played so fateful a part in the litigation with the Minerals Separation company.<sup>2</sup> They are no longer in use.

THE FROTH-CONCENTRATE is washed with the slime-table concentrate down a 6-inch pipe and a launder into a Dorr tank, 12 by 60 ft., in which it is thickened from 7:1 to 1:1, or half-liquid and half-solid by weight. Two Dorr tanks are now in use, but four will be needed when the new flow-sheet is put into effect. From the spigot of

the thickener the concentrate runs in thick pulsations along a launder inclined at two inches per foot to the Oliver filter. An addition of two pounds of slaked lime per ton of concentrate is made in order to enable the concentrate to hold its moisture, preventing the water from rising to the surface of the concentrate when it is loaded subsequently in cars on its way to the smelter. Two 12-ft. Oliver filters are in place (one in use) and a third is being erected. They work under a vacuum of 23 lb. per square inch. The tank under the filter serves for storage. The surface of the filter is kept clean by scrubbing it every three weeks with acidulated (HCl) water. This increases the efficiency of the machine as a

dewaterer. It works admirably. Invented originally<sup>3</sup> as a continuous cylindrical filter for use in cyanide mills, it has proved of great service in flotation plants. From the filter the concentrate is conveyed on a traveling belt to a railroad-car.

The sand-table concentrate is easier to drain. It goes to a separate annex containing 12 circular filter-bottom tanks, in which it is dewatered to 4½% moisture. It is discharged through the bottom of these tanks upon a traveling belt, which conveys it to the railroad-cars.

It will have been noted that ordinary gravity concentration is applied to the coarser part of the pulp before sending the slime to the flotation annex. A screen-analysis of the flotation-feed shows that

1% remains on a 48-mesh screen  
12% remains on a 100-mesh screen

Pulp that will just pass 48-mesh would be unsuitable. Most of the + 100 is gangue. Ideally the finer the pulp the better for flotation. The recovery is almost restricted to the -200 mineral. The coarser mineral is saved on the tables. Thus the mill-man produces a slimy concentrate and 'passes the buck' to the smelter-man. The loss is in ore that has been insufficiently ground, that is, insufficient to release the chalcocite from the gangue. The loss in -200 material is constant, being due to the imperfection of the apparatus and not to the

<sup>2</sup>See editorial 'The Miami Appeal' M. & S. P., June 23, 1917.

<sup>3</sup>By E. L. Oliver (Cal. '00), in the North Star mill, at Grass Valley, in 1908.

condition of the mineral. The mill-feed is comparatively uniform in its content of copper during any month, thus in three months it was:

Feed, %	Tailing, %
2.29 to 2.03	0.52 to 0.43
2.28 " 2.09	0.55 " 0.54
2.39 " 2.13	0.56 " 0.44

When the oxidized copper is crushed, it is ground finer than the gangue, passing readily into the slime and thence into the flotation-cells, where it is lost.

Flotation, like ordinary gravity concentration, makes a high recovery on the sulphide copper, but is powerless to save the oxidized mineral. Thus on a 2% ore containing 0.5% oxidized and 1.95% sulphide, the tailing will be 0.5%, of which 0.3 will be oxidized, so that the saving on the sulphide is 88% and on the oxidized only 40%.

Another factor is the grade of the ore. If 6000 tons of 3% ore were milled, it would be impossible to make a low tailing because, with a crushing-plant designed to treat 2% ore, the ore would not be crushed sufficiently fine to liberate the particles of chalcocite. Likewise the tables and flotation-cells would become over-crowded. If, on the other hand, 6000 tons of 1% ore were treated, there would be ample scope for all the apparatus and the tailing-loss would decrease, but the output of copper would also diminish to such an extent as to curtail the profit sadly.

The results for the first three months of 1915 and 1917 compare as follows:

Tons per day	Feed—		Concen- trate %	Tailing, %	Re- covery, %
	Total copper, %	Oxide copper, %			
1915 .....2,979	2.222	0.428	39.67	0.695	69.97
1917 .....5,641	2.116	0.256	43.35	0.638	70.87

Out of the entire mill-feed

30% is treated by flotation alone

40% is treated by gravity alone

30% is treated by gravity and flotation

To R. B. Yerxa (Mass. Tech. '03) I am indebted for much information concerning this department, of which he has charge. The oil is now added at the launder at the foot of the elevator that lifts the pulp to the flotation-cells. It is inadvisable to add the oil to the ore when in the Hardinge mill, because that machine is so far away from the flotation-cells that the oil would lose much of its effectiveness, by dilution with fresh water and by aeration, in its passage through the other apparatus.

Water is now added as the pulverized ore emerges from under the rolls and passes into the Callow screens. These are of 30-mesh; they pass about 28% of the feed into the undersize. To be efficient they need to be sprayed, but a spray cannot be used without entailing such an increase in the proportion of water as would be too much for the Hardinge mill.

The water used in the mill is reclaimed from the

tailing-ponds and thickeners. Thus 75% of the mill-water is recovered. It shows a marked tendency to froth. No alkali or acid is added. The slight natural alkalinity of the water corresponds to  $\frac{4}{10}$  lb. acid per ton. Note may be made here of the quantity of wood, in the form of splinters, that enters the mill with the ore in consequence of the slicing system of mining. This is a nuisance, which is mitigated by arresting the wood on screens distributed all over the mill, particularly where there is any break in the launders.

The ratio of concentration is 28:1. The grade of concentrate (42% copper) is suited to the operations of the smelter, for it leaves enough silica to slag the iron. It is the present aim of the manager of the Miami mine to make a 45% concentrate, with 20% insoluble, and a 0.25% tailing on a 2.15% ore containing 0.2% oxide. The good work already done augurs well for further accomplishment.

## Official List of Technical Men

The Bureau of Mines has completed a census of mining engineers, metallurgists, and chemists, showing that 7500 men engaged in mining and 15,000 men in the chemical industries have been classified according to the character of work in which each claims proficiency. It is not the purpose of this census to enable the Bureau to act as a clearing house for technical men in obtaining commercial positions. The reasons for taking this census are obvious. The War is one in which chemists and engineers play a greater rôle than ever before. The products of the mines, furnaces, factories, and chemical plants are being so rapidly consumed that the highest possible skill is required to keep pace with the destruction. The problem is to get the best qualified specialists for each place. Men with a knowledge of sanitation are essential to the health of the soldiers at the training camps; those with a knowledge of pyrotechnics in the manufacture and use of signal devices; telephone and telegraph operators are essential for systems of rapid communication, without which valuable time may be lost; mining engineers, under military control, will be of the greatest assistance in planning and directing sapping operations, in digging trenches, in the erection of concrete and steel supports for trenches, dug-outs, and tunnels behind the lines, and in planning systems of ventilation and drainage for such excavations; in re-habilitating or re-developing wrecked coal and iron mines taken from the enemy; and in increasing the output of minerals for military uses. The experience of some mining engineers in the use of oxygen mine-rescue apparatus might be invaluable in the exploration of underground saps or dug-outs. As it is important to keep the lists up to date, the registered engineers and chemists are requested to advise the Bureau of Mines of any change of address. Communications should be sent to the Director of the Bureau at Washington. Engineers and chemists who have not yet registered should do so at once.

# Flotation of Lead and Zinc in the Joplin District

By C. A. WRIGHT

From flotation tests made on the lead and zinc ores of the Joplin district it was found that it is relatively easy to float the sulphides. The ore consists mainly of zinc sulphide (sphalerite), with smaller quantities of galena. The gangue consists mainly of flint. In Joplin there are certain conditions, however, such as the quantity of floatable material available without resorting to further crushing, and the possibilities of finer grinding, that must be met, and the problems are to be worked out to insure success on a commercial scale. Due to these conditions which confront the millman in the treatment of these ores by flotation, the operators in the district have been somewhat reluctant in letting themselves be carried away by the possibilities of a greater saving by this means of concentration. Although flotation may not at present hold as important a place in the treatment of the Joplin ores as at many of the larger copper and zinc mills of the West, it is believed that before long many of the Joplin mills will have small flotation units for saving a large proportion of the metal in the fine now going to waste. Already five or six mills are using flotation successfully, while several others are still in the experimental stage.

In the Joplin district the mills are small, their capacity being 100 to 500 tons of ore treated in 10 hours. They are equipped with crusher, rolls, jigs, and tables. At most of them the material that reaches the jigs has passed a one-half inch trommel. The middling from the jigs, locally called 'chats,' are re-crushed for further treatment on sand-jigs or tables, or, at some mills, are returned to the roughing-jigs. Middling from the tables is seldom re-crushed. Therefore the first point to be considered is how much material now being produced is fine enough to be amenable to flotation; in other words,

what percentage of the total tonnage is crushed to a suitable size and what proportion of this size can be saved for re-treatment. To show more clearly the quantity of material available and of suitable size for flotation, a simple mill-test is submitted herewith. The ore treated was from a 'hard-ground' mine, better known as 'sheet-ground' ore, consisting chiefly of a flint gangue with a small percentage of zinc, and practically no lead.

Ore treated, tons .....1,994  
Concentrate produced, tons..... 35.5

Tailing, tons .....1,958.50  
Solids in overflow from settling tanks, tons..... 34.73

Tailing without overflow, tons .....1,923.77  
Concentrate (metallic zinc), per cent..... 59.4  
Tailing without overflow (metallic zinc), per cent.... 0.41  
Overflow (metallic zinc), per cent..... 5.01  
Zinc (metallic) in concentrate, tons..... 21.087  
Zinc (metallic) in tailing without overflow, tons..... 7.887  
Zinc (metallic) in overflow, tons..... 1.740  
Total zinc in ore treated, tons..... 30.714  
Zinc-recovery  $(21.087 \div 30.714) \times 100$ , per cent..... 68.6

The results of the mill-test shown in table 1 indicate a zinc-recovery of 68.6%, which is somewhat higher than the average zinc-recovery throughout the district. From the screen-analysis of the mill-tailing, not including the overflow from the settling-tanks, it is seen that 2.31% passes a 65-mesh screen, a product suitable in size for flotation. The tonnage treated during this test was 1994, giving 44.44 tons of material passing a 65-mesh screen. The calculated assay of this size of material is 5.24% zinc, and the total amount of zinc in the 44.44 tons figures 2.328 tons. Assuming that the overflow is of suitable size, 34.73 tons of solids is present assaying 5.01% zinc, which gives 1.740 tons of zinc. The sum of

Calculated assay .....			0.37	Assay of original ore.....			0.41

these two products gives a total of 4.068 tons of zinc in the material suitable for flotation, or a tonnage of 79.17, with a calculated assay of 5.14% zinc. Provided that this material would be available, and that 80% of the zinc could be recovered by flotation, there would be a saving of 3.256 tons of the metal. The total zinc contained in the 1994 tons of ore treated was 30.714 tons. The quantity saved in the concentrate was 21.087 tons. Including now the additional amount of zinc, 3.256 tons, that it would be possible to recover from the 79.17 tons of floatable material in the 21.087 tons of zinc, there results 24.343 tons of zinc saved out of a possible 30.714 tons, or a zinc-recovery of 79.2%. In other words, the percentage of zinc-recovery would be increased from 68.6 to 79.2, or an additional saving of 10.6% of the total zinc in the ore.

The above figures bring out the possibilities of a marked saving by flotation on a relatively large tonnage. Unfortunately, the average daily tonnage treated by the mills of this district is considerably less than the tonnage treated during the time the mill-test was being made. It is reasonable to believe, however, that the mills treating 500 to 1000 tons of ore per day could well afford to install a small flotation unit at a profit, the size of the plant depending upon the quantity of fine material produced. In the case of soft-ground deposits there is generally a much larger percentage of fine produced in milling the ore, so that there would be a sufficient tonnage of fine coming from a mill treating 200 to 300 tons per day for a 20 to 30-ton flotation unit. The next step in determining the possibilities of flotation for the ores of the Joplin district is the profitable limit of grinding to a size suitable for flotation. This is one of the main difficulties with respect to flotation, as the gangue consists mostly of flint. Therefore, in case there is not sufficient material available for flotation, the problem resolves itself into one of fine grinding rather than to the floating of the mineral. Many kinds of fine-grinding mills have been tried in this district with somewhat discouraging results, due to the high abrasive action of the flint. In fact, fine grinding of Joplin ores, either by ball-mills or other means, is still a problem to be solved. There are certain products, however, from the various stages in the concentration of the ores, that would be less resistant and would respond more readily to finer grinding. Some of these products are: (1) 'chats' or included mineral particles from the jigs; (2) tailing from the tables treating fine; (3) all table-middling that needs to be re-crushed before further treatment; and (4) possibly the oversize often discarded from the sand screens. The important factors to be considered for the treatment of these products by flotation are the cost of fine grinding, the quantity of material to be re-ground, and the zinc content. If the material contained 1% metallic zinc, equivalent to 2% of the 50% zinc concentrate, and the concentrate was worth \$50 per ton, the material would have a value of \$1 per ton, or 80c. per ton on a basis of 80% zinc-recovery. For material containing 2% zinc these values would be \$2 per

ton and \$1.60 for an 80% recovery. In other words, it is possible to figure from the zinc-content and the possible zinc-recovery what value can be placed on the material to be crushed and treated. The cost of fine grinding would depend upon the type of grinding-mill used and on the character and coarseness of the material. The greater the tonnage treated the less will be the cost of grinding and subsequent treatment. The possibilities are, therefore, greatly increased when one considers the increased tonnage available by finer grinding. In addition to the increased tonnage of floatable material secured by finer grinding, slime or fine sand at present being treated on slime-tables could be well taken care of by flotation, and a higher zinc-recovery effected than is usually possible on slime-tables.

In view of the demand for high-grade zinc concentrate by smelters, zinc ores containing a comparatively large proportion of lead and iron sulphides would require either differential flotation or re-treatment of the concentrate on tables. A preliminary treatment of the floatable material on tables to eliminate the lead and iron has been suggested, but this would require extra tables and its efficacy is doubtful. Re-treatment of the concentrate on tables seems to be the most feasible method in separating the lead and iron sulphides from the zinc-blende, and could be accomplished at a small cost, using a small diaphragm-pump operated in closed circuit to return the tailing from the tables to the flotation system. This method of re-treatment gives satisfactory results in some Western mills. The froth from the concentrate is largely 'killed' by spraying it with water, or by some other means, before it reaches the table. The ease with which the froth is killed depends largely upon the oil-mixture or frothing-agent used in producing the froth. The composition of the gangue in the ores of the Joplin district differs somewhat and the mineral content varies. Consequently, though many available oils give acceptable results, no one oil or fixed quantity of oil under the same conditions will give the best possible results for all ores. The best oils or mixtures of oils must therefore be determined by experiment on each ore.

The Bureau of Mines, in co-operation with the Missouri State Geological Survey, started flotation experiments in the Joplin district in the latter part of the year 1914, and continued until the spring of 1915. In the first experiments different oils were tried in varying quantities to decide which oil was best suited to the material treated. When this point had been determined, the same tests were repeated with the addition of sulphuric acid in varying quantities. The effect of temperature was then considered. It was found from the preliminary results that the sulphides of this district are apparently not difficult to separate from the gangue, and that a fairly good grade of concentrate could be secured by the use of roughing and cleaning-cells. Oils with a coal-tar base gave a high recovery but a low-grade concentrate, a considerable amount of gangue being entrained in the froth. Other oils gave a higher-grade concentrate but not as good an extraction under like con-

TABLE 2  
Acid roughing-tests

12	1.7 wood-creosote .....	93.0	40.8	89.0	Strong froth
13	2.0 S. S. gas-creosote .....	78.0	46.8	85.8	Strong froth, rapid
14	1.7 eucalyptus-oil .....	110.0	34.2	88.2	Good frother

ditions. The best results were obtained with wood-creosote and pine-oil. As the coal-tars and some petroleum products are good collectors and the pine-oils and some other oils from wood distillation are good frothing-agents, it would seem that a mixture of these oils, such as 80% coal-tar and 20% pine-oil or wood-creosote, or combinations of these, would be best suited to the treatment of the Joplin ores by flotation.

To verify the data obtained from this preliminary work, slime produced from one of the sheet-ground mines near Webb City, Missouri, was shipped to Salt Lake City, Utah, where the Bureau of Mines in co-operation with the University of Utah is conducting flotation experiments. The results given in tables 2, 3,

cept in test No. 9, which was run at 20°C. Total time consumed in agitation for each test was about 18 minutes.

## CLEANING-TESTS

Samples of each froth from roughing-tests were taken and the remainder saved for cleaning-tests. Combined roughing-froths made enough material for two cleaning-tests, the results of which were as follows:

TABLE 4  
Cleaning-test No. 1

Froth used, gm.	Assay of head			Assay of product		
	Zinc %	Lead %	Product, gm.	Zinc %	Lead %	Extraction, %
500	39.8	1.3	366.5	51.7	2.35	95.3

Total recovery, zinc and lead.....						93.2		3.3		4.0	

4, and 5, from experiments performed by O. C. Ralston and G. L. Allen, showed that it is fairly easy to float the sphalerite from the gangue by using warm solutions and about 1 lb. per ton of any suitable oil, either from wood or coal distillation, and that acidity, although it does not seem to be necessary, allows the froth and tailing to separate more quickly. Cold solution gave as high an extraction as warm solution, but the grade of the product was not as good.

## RESULTS IN FLOTATION OF JOPLIN SHEET-GROUND SLIME

Conditions of tests: Assay of slime tested, 8.54% Zn, 0.51% Pb, 0.7% Fe. Charge in each test 500 gm., with 1500 to 2500 cc. H<sub>2</sub>O. Temperature of pulp, 60°C., ex-

The oils used were: Sunny South No. 4, pine-oil of General Naval Stores Co., New York; crude cedar-oil, from Idaho cedar swamps, Government work; Sunny South No. 8, special pine-tar oil, General Naval Stores Co., New York; beechwood creosote, specific gravity 1.078, Merck & Co.; Salt Lake gas-creosote, fraction 500-612°F., Salt Lake Gas Works; eucalyptus oil, Atkins, Kroll & Co., San Francisco.

The above tests, No. 1 to 4, given in table 2, were to determine the effect of various quantities of acid on the percentage of recovery, the grade of the concentrates, and also to obtain a sharp line of separation between the yellow froth and white tailing, the quantity of oil used being constant. The results indicate that the quantity of acid used has little effect upon either the grade of the

concentrate or the percentage of recovery, but it was found that the line of separation between the concentrate and tailing, as seen through the glass slide of a laboratory machine, is much more quickly and better defined by the use of a large quantity of acid. The next four tests, No. 5 to 8, table 3, were made with varying amounts of oil, some acid having been added to allow the experimenters to see the froth and tailing separate more quickly, and to clean the surfaces of the sulphide minerals. No distinct effect was observed except that one pound of oil per ton of ore treated seemed to give the highest grade of concentrate. Test No. 9 was run to parallel test No. 6, except that a cold pulp at 20°C. was used in place of the warm pulp at 60°C. in the other tests. The lower grade of froth proves the greater ability of froth and tailing to separate from each other at elevated temperatures. The other tests, No. 10 to 14, were made with various kinds of oils. After sampling the froth-concentrates they were mixed, and two tests (tables 4 and 5) were made using the flotation cell as a 'cleaning' unit. The previous tests had been performed with the cell as a 'roughing' unit with a high recovery of zinc as the end in view. When cleaning the roughing-froth a concentrate of high zinc-tenor should be the aim, but these tests were carried to nearly complete removal of the zinc, so that only a small amount of middling was left for returning to the roughing-cell and the concentrates obtained were perhaps not quite as high in zinc as could be secured by returning a large quantity of middling. A scheme making use of roughing and cleaning-units of flotation cells seems essential in order to get a high recovery and to produce concentrate of acceptable grade.

In the experiments made in Joplin, the ratio of solids to water in the pulp treated ranged from 1 to 3 up to 1 to 7. In practice the most favorable ratios for different ores would, of course, have to be determined by experiment. In general, a mixture of fine and slime requires a denser pulp, whereas for a mixture consisting wholly of slime (finer than 200 mesh) a thinner pulp is desirable. Thickening of the slime from the mills of the Joplin district would be necessary and could be accomplished by the use of Dorr thickeners or some other device that would give the flotation machines a uniform feed of constant density. The addition of acid may not be absolutely essential for all the ores of the district, although the tests made locally showed that a small quantity of acid is desirable, especially in cleaning the roughing-concentrate.

During the past year the following companies have installed successful flotation units, varying in capacity from 25 to 100 tons per day: American Zinc, Lead & Smelting Co. at both Cartersville and Granby, Missouri; Picher Lead Co., at Picher, Oklahoma; Mining & Flotation Co., at Joplin, Missouri; and the Oronogo Circle Mining Co., at Oronogo, Missouri. Other operating companies are still in the experimental stage, but will probably soon be listed among those using the flotation process.

## Utilizing Pyrite in Coal

Illinois coals contain from 1 to 6% of sulphur. The outlook for recovering a large part of this is the subject of a most suggestive bulletin by Joseph E. Pogue, published by the Illinois State Geological Survey. The sulphur in coal-seams is present chiefly in the form of the brass-yellow pyrite or marcasite, called commercially 'coal-brasses' and termed by the miners 'sulphur.' This material occurs as small seams, lenses, and nodules scattered through the coal, and is generally looked upon as an objectionable impurity, because it must be removed before the coal is marketed. As a matter of fact, however, this so-called impurity is a raw material of value for the manufacture of sulphuric acid, and its recovery, in those mines in which it is now thrown aside, affords a good opportunity for turning a troublesome waste-product into profit, and establishing a new source of revenue. There is a possibility that some mines, abandoned because of the unusually high sulphur content of the coal, may be re-opened and successfully operated as pyrite producers, with coal as the by-product. A few Illinois coal mines for a number of years have been recovering the pyrite and selling it to chemical works, but the output of the State has never exceeded 27,000 long tons per year. This figure falls far short of the possibilities of the State. With a coal production of 60,000,000 tons per year and with pyrite worth about \$8 per ton, the Illinois coalfields may greatly extend the pyrite yield. There are four sources of domestic material suitable for the manufacture of sulphuric acid. The first of these is included in the many small deposits of pyrite and related sulphides scattered through the Eastern States. These were formerly unable to compete with the Spanish ore, which was brought to this country cheaply as ballast by Mediterranean freighters. The second is formed by the fume of many smelters, chiefly in the Western States, formerly allowed to go to waste, but now beginning to be turned into acid. The third is the large native-sulphur deposits at Sulphur, Louisiana, and at Bryan Heights, Texas, which yield a very pure product, too costly under normal conditions to compete with pyrite, but which may be utilized to meet the pyrite shortage during the present emergency. The fourth source is the pyrite accompanying coal-beds, now largely wasted.

SHIPMENTS of high-grade manganese during the past six months aggregate 28,345 tons, or nearly 10% more than the tonnage for the whole 12 months of 1916. Deliveries are reported from ten States. In Montana alone the shipments since last January exceed the shipments for the whole United States in 1915. The U. S. Geological Survey estimates that 80,000 tons of the high-grade ore will be produced in this country during the current year. This, however, is less than 20% of the demand of the steel industry, based on present consumption. The output of lower-grade manganese ore is likewise record breaking.

# Mechanical Ventilation for Metal Mines

By GEORGE RICE

\*Mechanically produced ventilation of mines has been regarded, until the last few years, as necessary only in coal properties. The haphazard ventilation of metal mines is in striking contrast to the high order of engineering in other departments of metal-mining operation. Ventilation of coal mines, on account of the inflammable gases given off from the strata, or because of the loss of oxygen from the air through absorption by the coal, made the positive 'coursing' or circuiting of the air-current a necessity. This was recognized a century ago after serious explosions of fire-damp had occurred, although coal-mining operations were on a very small scale at that time. Notwithstanding the slow development of positive ventilation in metal-mining operations, mechanically produced ventilation of such mines received an early start. Agricola in his book describing the mining practice of the 16th century in the Harz mountains repeatedly refers to ventilation. The following are some quotations taken from the Hoover translation of Agricola's book:

"I will now speak of ventilating machines. If a shaft is very deep and no tunnel reaches to it, or no drift from another shaft connects with it, or when a tunnel is of great length and no shaft reaches to it, then the air does not replenish itself. In such a case it weighs heavily on the miners, causing them to breathe with difficulty, and sometimes they are suffocated, and burning lamps are also extinguished. There is, therefore, a necessity for machines \* \* \* which enable the miners to breathe easily and carry on their work.

"These devices are of three genera: The first receives and diverts into the shaft the blowing of the wind, \* \* \* The second genus of blowing machine is made with fans, and is likewise varied and of many forms, for the fans are either fitted to a windlass barrel or to an axle. \* \* \* Blowing machines of the third genus, which are no less varied and of no fewer forms than those of the second genus, are made with bellows, for by its blasts the shafts and tunnels are not only furnished with air through conduits or pipes, but they can also be cleared by suction of their heavy and pestilential vapors."

Agricola's drawings show many varieties of ventilating devices; some are dependent, as indicated in the above quotation, on the effect of the wind, while others are the predecessors of the centrifugal fans. Several of the drawings show large feathers set radially in the axle; others show wooden blades or paddles arranged as in the later Guibal fan. Apparently, however, the proper arrangement for admitting the air to the fan at the axle

had not then been discovered. In these old drawings, the air appears to enter a slot on the circumference of the casing and is discharged through a wooden conduit at another place on the circumference. Presumably the action of the fan was improved through the leakage of the wooden sides, so that accidentally it may not have been as inefficient as it appears. The drawings seem to indicate that the use of brattices in shafts and ventilating-doors was understood, although there is no indication that a circuit of air was maintained, away from the shaft or beyond where a shaft intersected drift-workings, except by wooden pipes.

Little advance seems to have been made in metal-mining ventilation for the 300 years thereafter, until compressed-air drills came into use; then the exhaust was regarded as furnishing sufficient air in the working-place. When the drill is not running, if the atmosphere is oppressive in the heading or stope, or is foul after blasting, the compressed air is allowed to blow direct from a pipe-outlet. Undoubtedly in small metal mines, or those in which there is no considerable amount of noxious gas given off, or where workings are a short distance from the drift-mouth or shaft, this may be sufficient. In most metal mines, owing to the ore formation generally having considerable length along the strike, and depth vertically or on the dip, but generally no great width, the difference in temperature between the lower workings and the outside atmosphere generates air-currents when secondary connections have been made to the surface.

Inflammable gases are rarely found in metal mines, and generally there is a little absorption of oxygen by the ore or enclosing walls, although in mines in which there is much timbering it has been found that there is considerable absorption of oxygen by the timbers due to bacteriological action. Nevertheless, thousands of samples of air that have been gathered by the Bureau of Mines in metal mines indicate that, except after blasting, it is rare when the air contains a considerable amount of impurity. Occasionally, as in the Cripple Creek district, metal mines contain large amounts of pure nitrogen gas residual in the strata. Such mines can only be worked by the employment of a plenum-pressure system of ventilation. In general, however, the chief air-impurities in metal mines arise from blasting.

In the case of long drainage-tunnels, the rule is to ventilate with fans and air-pipes, and it is obvious that it is an economic advantage to quickly ventilate the heading after blasting so that the miners may get back to their work as soon as possible.

In great orebodies, such as are found at Butte, in the

\*Paper presented at the 6th Annual Safety Congress of the National Safety Council.

Lake Superior iron and copper mines, in the copper mines of the South-West, and especially in the deep and extensive gold mines of South Africa, there has been a gradual introduction of mechanical ventilation apart from any dependence on compressed air at the faces.

Attempting to ventilate by means of compressed air when there is a considerable volume of noxious or poisonous gases present, as from blasting, is extremely inefficient both in sweeping away the smoke and gases which it tends merely to stir up, and from the important standpoint of mechanical efficiency in using air which is usually compressed uneconomically to a high pressure, and liberating it without doing mechanical work against atmospheric pressure. The only remedy is to arrange as far as possible for circuiting of the air, supplemented by 'booster' fans.

It is hardly worth while to argue the need of having two means of exit from a mine, as this is the requirement in most State metal-mining laws. Probably over 95% of the metal mines of the country which have reached a permanent basis of ore-production, have two exits. Where there are two such exits one naturally becomes the up-cast and the other the down-cast. Unfortunately, however, these conditions sometimes change with the season and with such changes the natural ventilation underground is insufficient. Hence there is necessity for the use of fans. In very deep mines, such as in the copper mines of the Lake Superior district, normally the up-cast and down-cast conditions do not reverse, and the natural main up-casting current is very strong. It then becomes a problem whether or not in the interest of safety to prevent reversal of the current in the case of a mine-fire in the down-cast, it is not best to install a large fan, which may never be needed except for fire-protection. However, in the great majority of mines a strong non-reversing current due to the difference in temperature in the up-cast and down-cast shafts cannot be obtained. This being the case it is highly important, both for fire-protection and for a positive circuit of air through the mines that fans shall be used.

The great variety of conditions found in metal mining in the United States, varying from typical veins to the great lenticular and irregular iron-ore deposits of the Lake Superior district, makes it impossible to lay down as exact a procedure as is usually regarded necessary in planning coal-mining development. Nevertheless it will be generally conceded that a great deal more might be done in the future than in the past if preliminary planning of a ventilating system is borne in mind, particularly in developing low-grade deposits.

While metal-mining laws and modern practice require two exits and recognize the necessity of air down-casting in one shaft or winze, and returning through another shaft or winze, adit, or tunnel, the necessity for provisions for circulating the air through the mine has not been well recognized, with the result that in some of the great mines of the United States the ventilation is of the most haphazard character. Often I have had occasion to observe that the main fan placed under-

ground is ineffective because part of the air-discharge has been circuited round and round. Therefore, even when the percentage of impurity in the air might be low it did not take care of one of the most important features of deep mine ventilation, namely, to keep the temperature below that of the mine-walls. It is not always a question of depth or natural heat of the strata, but where large masses of timber are employed, especially in the caving-system employing a timber-mat, the temperature is frequently far greater immediately under the mat than it is in the deeper levels.

It is believed that if the same degree of care were taken in laying out in advance the ventilating system that is given to laying out the levels, drifts, cross-cuts, and raises, for extracting the orebody, a great deal of the difficulty of a physiological nature now experienced by the miners would be prevented. These troubles are not simply those of temporary discomfort of the workers, but their health is likely to be affected, making them liable to contract diseases, lessening their working efficiency, and thus decreasing the earning power of the mine. Ventilation therefore comes to be a matter of economic importance. It is difficult to speak of specific mines or districts without making unfortunate comparisons, but that the problem is acute will be readily admitted by most mining authorities.

Another phase of the physiological problem concerning workers in hot mines, is not alone in the high temperature of the air but in the fact that the air is not in motion. The experiments of Dr. Haldane, of Oxford, a celebrated physiologist, brought out strikingly that in still hot air the body is enveloped with a film of air at or near the blood-heat and the skin is not cooled by evaporation of the sweat, but if the air is in motion, unless it is saturated, which it seldom is, evaporation follows, and thus the skin is cooled. I recall a case where, in a certain stope, there was no movement of the air, and the miners complained of the heat and from time to time went into a nearby cross-cut where there was a strong current of air and were comfortable, although in the cross-cut the temperature was actually several degrees hotter.

The great variety of mining conditions found in the United States prevents formulating an exact specification for a ventilating scheme which would fit all conditions, but in order to bring out discussion the following general principles are mentioned which may be of guidance in planning a ventilating system for new mines or in adapting the arrangement of old mines as far as possible:

- (1) There shall be a permanent up-cast and permanent down-cast shaft.

- (2) The down-cast shaft shall be, as far as practicable, the shaft in which the men are hoisted and lowered. It may or may not be the main ore-hoisting shaft, the object being that, in case of fire, the main hoisting arrangements for the men will be available, and, if practicable, this shaft and its landing shall be concreted or otherwise fire-proofed, and back of each landing there

shall be a fire-proof door to protect the men from the workings beyond.

(3) The main shaft shall extend to the lowest working so that the fresh air may go to the bottom of the mine and then ascend on either side through the workings to the up-cast shaft; sufficient splits of air to be taken off on the different levels to provide for proper ventilation; the return air to be taken around the down-cast shaft by cross-cuts or concreted bridges.

(4) The main ventilating fan should be placed on the surface; the fan to be of fire-proof construction and with fire-proof housing; this to be a reversible fan. Generally the most convenient arrangement would be to place it near the collar of that shaft which is not the main hoisting shaft. Of course a tunnel or slope mouth would be equally as good. This is to avoid an air-lock; therefore, the fan would normally be an exhaust-fan, but as previously stated it should be reversible to provide for emergencies.

(5) The fan should be of sufficiently large size to take care of the largest volume of air which is likely to be necessary for at least 5 or 6 years of development, and it should be able to deliver and to draw air at a pressure in excess of that which could be produced by maximum natural causes, that is, the maximum motive head of the air column, due to the maximum difference which may obtain, between the temperature of the mine-air and of the outside air, in the coldest or the warmest days of the year. In general, the main fans at metal mines are entirely inadequate, and fans such as are employed in large coal mines should be installed in metal mines where the workings are expected to be of large extent and to require many men underground. By this is meant fans which will discharge from 100,000 to 300,000 cu. ft. of air per minute against a pressure measured by 2 to 6 in. of water-gauge. On account of the fire-risk it is not good practice to place the main fan underground, and moreover there is usually a liability of the air short-circuiting, that is, going around and around and not being discharged to the surface.

(6) 'Booster' fans are necessary in exploratory drifts, and in running winzes or raises and in high stopes. New devices in the way of canvas pipes and hanging arrangements have been developed recently that make admirable auxiliaries for reaching the face of headings and winzes, but wherever possible it should be planned, as in coal mining, that a continuous circuit of air be obtained after it has been established that bodies of ore exist that sooner or later will have to be blocked in order to give adequate ventilation throughout.

A number of the greatest fire disasters in metal mines would have occasioned a much lower loss of life had there been continuous circuits of air, which would have enabled the miners to reach the in-taking air. The great merit in fire-proof down-cast shafts and the landings adjacent to these is to enable the escape of the men who could keep in fresh air by traveling against the in-taking current. On the other hand, if an un-fireproofed down-cast takes fire, as at the Cherry coal mine or the

North Butte copper mines, it nearly always means disaster, and the only remedy then is a prompt reversal of the fan, which if accomplished in time might save the men. If this cannot be done, or if all passages for escape are already filled with smoke, the only thing left for the men is to brattice or bulkhead themselves off in some heading free from smoke, marking with chalk where they have gone, for the subsequent direction of the rescue-parties. While the cost of providing adequate ventilation is considerable, whether it be in metal mines or in coal mines, it must be regarded as a vital necessity for deep mining. Anyone who has visited deep or hot mines, such as those of the Comstock Lode or at Butte, must realize the need of providing the best ventilating system possible in order that deep mining may be carried on at all. Where nitrogen gas is found, or where spontaneous fires occur in rich sulphide ores, as in some Montana and Arizona mines, or in mines where sand or slime filling cannot be accomplished, it is necessary to erect fire-walls and put in a plenum-pressure system of ventilation so that the gases may be forced back into the crevices in the strata or behind the fire-walls.

## Chilean Nitrate

Government purchases of Chilean nitrate for this country will be co-ordinated through the purchasing committee of the War Industries Board, under the immediate supervision of Mr. Baruch, so that there will be no competitive bidding for this material. This should simplify the problem and make it feasible to secure the best possible terms. The price of Chilean nitrate on board ship in Chile has greatly increased within recent months without justification. Shipping rates also have advanced. The increase in price is due in part to unfounded statements regarding the demand for Chilean nitrate for munitions and for fertilizer, especially in connection with the \$10,000,000 recently appropriated by Congress to purchase nitrate of soda. Actually the demands of this country for nitrate of soda will be smaller than heretofore. The Navy already has placed contracts for this material to satisfy its needs for the next twelve months. The War Department announces that practically all the sodium nitrate which it has been planned to procure has been contracted for. Under a recent authorization of Congress there is available an appropriation of \$10,000,000 to be used, at the discretion of the President, to secure nitrate of soda and to supply it to farmers at cost for cash. The quantity which may be purchased for fertilizer use under the special appropriation of Congress will not be an addition to the quantity normally used. Any quantity purchased by the Government and sold to farmers will simply replace part of the quantities heretofore supplied to them through private agencies.

BRASS on being melted suffers by oxidation of the zinc and copper. E. D. Frohman states that this may be prevented by covering the metal with charcoal.

# The Chemical Exposition

By M. W. von BERNEWITZ

Fully 100,000 people, of whom 25% were men of special scientific training, received inspiration at the third National Exposition of Chemical Industries held at the Grand Central Palace, New York, during the week of September 24. At no time was the place crowded, but those in attendance appeared bent upon studying what was presented. There were meetings of scientific societies, moving pictures illustrating various industries, and over 400 booths containing an aggregation of apparatus used in chemical manufacturing; therefore visitors could not complain of a lack of variety. There is no doubt that the show was a success, which gives encouragement for promoting another in 1918. Broadly speaking, the exhibits might be classed under eight groups; for example, dyes and colors, instruments, acid-proof apparatus and connections, glass, porcelain, and silica-ware, refractories, metals, ore-treatment apparatus, insulating materials, and by-products. The first of these was shown in about 25 booths, the products being in bottles and in various cloth, silk, and leather materials. Dye manufacturers were probably the most prominent of any exhibitors. Instrument-makers were in force, showing the latest ideas in balances, control, electrical, liquid, temperature, and vacuum-measuring devices, some of which were to be seen in operation. Measuring temperature by radiant heat was of interest. A dozen firms showed chemicals, including explosives. A demand is increasing for acid-proof apparatus, such as evaporators, heaters, pumps, and pipe connections. These were shown as special iron compounds, enameled iron, lead, and earthenware, some of the last being cleverly made. There was also acid-proof cloth. Considerable laboratory glassware was on view, and porcelain for all purposes. Silica-ware, both transparent and opaque, was keenly examined. This, as most chemists know, is made from pure quartz. It will stand great variations in temperature without cracking, is proof against all acids save hydrofluoric and phosphoric, and is superseding platinum for many purposes. Refractories included ores and brick. Several well-known smelting concerns had excellent exhibits of electro-spelter, copper, and lead. Much interest was taken in the spelter, the latest metallurgical triumph on a large scale. Millmen had a chance to see in operation ball-mills, concentrators, flotation machines (the odor of the oil sufficing to direct one to the place), and filters. Cyanide (30%), made from cyanamid, was on view. It is blackish and reminds one of the salt produced 20 years ago. The 52% salt was also shown. Smoke-farmers could see how their damage-suits are going to lapse by reason of the well-known precipitator. Several types of smoke-helmets were demonstrated in a practical way. Insulating materials included rubber, vulcanite, bakelite, and brick. Tungsten producers had a chance to see 99% acid ( $\text{WO}_3$ ), a canary-yellow powder worth \$1.50

per pound. By-products were shown by numbers of manufacturers. Smelters displayed gold, silver, platinum, bismuth, tellurium, and the like, all recovered during the refining of base metals. Perhaps the most interesting by-product exhibit was one arranged like a family tree, showing actual specimens of the derivatives from coal, including coke, tars, oils, colors, disinfectants, drugs, explosives, and many other things.

It would be unkind to indulge in much criticism of such an exposition, but as an unbiased spectator during four days some defects were apparent. The ramifications of chemistry are far-reaching, but a line should be drawn somewhere; and such exhibits as 50-ton evaporators, large mixing, drying, and centrifugal machines, elevators, trucks, corn products, engineering firms, Japanese chemicals, milling and treatment-machinery for mines, and excessive space occupied by the Southern States and railroads showing their mineral resources, it would seem might better be shown elsewhere, and the space so occupied filled with matter pertaining to the real chemical industries. A number of the large chemical firms was conspicuous by being absent. These should be in evidence at future expositions.

## Sulphuric-Acid Production

Under the conditions imposed by the War an enormously increased demand has developed. The production in 1916, expressed in terms of acid of 50°B., was 5,642,112 tons, valued at \$62,707,369, to which must be added 443,332 tons of acid of strengths higher than 66°B., not convertible into acid of 50°B., valued at \$10,806,757. This includes by-product acid, that is, acid produced at copper and zinc smelters. The production of acid from this source in 1916, expressed in terms of 60° acid, was 1,069,589 tons, valued at \$12,158,266, and 92,802 tons of acid stronger than 66°B., valued at \$1,941,661. Sulphuric acid was produced at 211 plants. In the production of all grades of acid the following amounts and kinds of sulphur ore were used:

ORE USED IN MAKING SULPHURIC ACID, LONG TONS

	Domestic	Foreign	Total
Sulphur .....	261,574	10,903	272,477
Pyrite and pyrrhotite.....	324,602	1,154,550	1,479,152
Gold and silver-bearing pyrite..	1,673	.....	1,673
Copper-bearing sulphides .....	568,116	196,404	764,520
Zinc-bearing sulphides .....	531,625	92,002	623,627

Included in the pyrite and pyrrhotite are all the sulphide ores used which were not treated further for their copper, lead, zinc, gold, or silver content. Much of this material contains small amounts of these metals.

RUBBER has been decreasing in price for many months. 'Up-river fine' has gone down from 81c. per pound in 1916 to an average of 65½c. for the month of September 1917. Of the other chief materials used in rubber-tires, cotton is now worth 27c., zinc oxide 10½c., and lithophone 6½c. per pound.

## CRIPPLE CREEK, COLORADO

CRESSON CONSOLIDATED.

The following circular letter to stockholders from A. E. Carlton, president of the Cresson Consolidated Gold Mining & Milling Co., accompanying the October dividend checks, is self explanatory: "Under date of September 20, 1917, Mr. Noble, consulting engineer of your company, reports net profits on fully developed ore-reserves, as of September 1, 1917, of \$3,652,562. The ore shipped in August yielded a net return of \$220,221.27 above cost of operation. Your company has cash in bank today of \$1,255,003.84, and, in addition, about 30 cars of ore in transit and at the mill, of an estimated value of \$40,000. New ore of a net value of \$17,883 was added to reserves during the month. Mr. Noble reports regarding the new workings as follows: On stope 1417A a winze 25 ft. deep has shown continuous high grade to the bottom, and a drift has now been started westerly. In drift 1517, directly below 1417, 45 ft. of ore of good grade has been opened. A raise from this is showing improving values in going up. The ore cut in 1602 has been developed 50 ft. in length. Many good streaks carrying sylvanite ore are observed coming into the main vein, and it is probable that a greater width than now disclosed will be opened when air-connections permitting more active work are made. In drift 1609, 50 ft. of ore is shown and in 1608 a length of 43 ft. The ground between these two will probably be found to be mineralized when stoping is started. Mr. Noble has not as yet figured in the reserves any of the orebodies now under development on the sixteenth or lowest level. Distribution No. 60 of 10c. per share has been declared from funds received by your company from the sale of ore-reserves acquired prior to March 1, 1913, check for which is enclosed."

Richard Roelofs, superintendent of the Cresson company, has submitted his resignation and is reported to have been paid a handsome cash bonus. His contract with the company had still two years to run. He will be identified with the McNeill Carlton interests. He will be succeeded as superintendent by A. L. Bloomfield, for many years associated with the Golden Cycle Mining & Reduction Co. The change will take effect on November 1.—The Vindicator Consolidated Gold Mining Co. has declared its regular quarterly dividend of 3c. per share, amounting to \$45,000, payable October 25, to all stockholders of record on October 15.—The Portland Gold Mining Co. will pay its regular quarterly dividend of 3c. per share, \$90,000, on October 20 to stockholders of record on October 10. With this distribution Portland stockholders will have received \$10,957,080 in dividends. The company is now making ready to accept and treat custom ores. Scales are now being set in at the new sampling-plant at the Independence mine, and low-grade ores will hereafter be treated at this mill within 30 days. The rate for treatment has not been announced.—The September production from the South Burns mine of the Acacia Gold Mining Co. was limited to about 200 tons of ore. Two cars mined on company account averaged \$25 per ton. Lessee's shipments of four cars averaged \$18 per ton.—The Cripple Creek Deep Leasing Co. and F. T. Caley, operating leases on the Jerry Johnson mine on Ironclad hill, owned by the Jerry Johnson Gold Mining Co., mined and shipped seven cars of ore running from \$18 to \$25 during the

month of September. The Roosevelt tunnel, of the Cripple Creek Deep Drainage & Tunnel Co., was advanced 166 ft. during September. The heading is now in the Rose lode mining claim on the north-western slope of Battle mountain belonging to the Rose Nicol Gold Mining Co. The flow from the tunnel has fallen to 5123 gal. per minute. Practically all of the corporations operating on company account in this district have adopted the bi-monthly pay-day. Employees will now be paid on the 10th and 25th of each succeeding month.

## HOUGHTON, MICHIGAN

THE 1917 PRODUCTION.—LABOR CONDITIONS.—ISLE ROYALE.

If the copper production from the mines of the Lake Superior district reaches a total of 235,000,000 lb. for 1917 there will have to be a substantial improvement in the output of all mines from now until January 1. The production for September is estimated at 18,000,000 lb. The production for October may show an increase of 1,000,000 lb. over that amount, but the fact remains that the whole district is likely to show a decrease of close to 30,000,000 lb. over 1916. Last year this district produced 263,000,000 lb.—The daily output of ore from the Calumet & Hecla increased in October from 8000 to 9000 tons and before the middle of the month the mine should be producing 9600 tons. This mine is more fortunate than the smaller ones and seems likely to have no labor difficulty ahead. During the spring and summer trammers were not only difficult to secure but hard to keep, and all the mines were constantly changing this form of labor. Now the situation is different; the men are coming in seeking work every day; moreover, they are sticking to their jobs and show no desire to quit. Miners are plentiful.—Production of ore from the Mass Con. has increased 10% in the past month and now runs 600 tons per day.—The Ahmeek is handling an average of 85 cars of ore, a reduction of 15% since mid-summer.—The Old Osceola, of the Osceola Con., is shipping 650 tons, a 15% increase, while the North and South Kearsarge are handling 2600 to 2800 tons per day.—The Wolverine has reduced ore shipments from 1200 to 950 tons, owing to accident. An over-hoist put the skip, loaded with ore, through the top of No. 4 shaft-house and hauled it over to the compressor.—The St. Paul railway, in conjunction with Copper Range, may build a spur to Michigan.—No. 5 shaft at the Quincy is showing a sensational amount of mass and barrel copper that is going directly to the smelter. This runs 75% copper.—Production at the Wolverine is normal again, repairs having been completed at No. 4 shaft. Ore shipments now are running 40 cars per day.—There has been a slight falling off in the Franklin ore shipments lately; production is now running about 850 tons.—Calumet & Hecla authorities deny the rumor that the company is increasing its holdings of Isle Royale stock. This sets at rest the story, but does not in the least divert attention from the fact that no Calumet & Hecla subsidiary is attracting more favorable attention than this property. Isle Royale is a pronounced success. The management is working the mine in the only way possible for such a low-grade ore, namely by handling large quantities. Isle Royale reached its maximum production in 1916 when the output was 12,412,111 lb., compared to 9,342,106

in 1915, 6,601,235 in 1914, and 4,158,548 in 1913. When it is realized that the output of copper from this mine is four times what it was four years ago, some idea of the way this property has been developed may be judged. Isle Royale owns \$160,134 worth of stock in the Lake Milling, Smelting & Refining Co. as well as \$32,000 worth of stock in the Lake Superior Smelting Co. at Dollar Bay.—The Cherokee shaft has been sunk 420 ft., but cannot go much deeper until a new rope is secured. Good looking copper ore, some mass, some amygdaloid, and some epidote, have been found.—The second unit in the leaching-plant at the Calumet & Hecla mills at Lake Linden is being built rapidly.—A flotation unit at White Pine, to handle 600 tons per day, will be in operation at this subsidiary of the Calumet & Hecla as soon as possible.

## PLATTEVILLE, WISCONSIN

### ZINC AND LEAD SITUATION.—GRASELLI CHEMICAL CO.

A leading smelter representative, when asked for information regarding the spelter situation, blamed spelter manufacturers for the perplexing and unsettled conditions in the spelter market. He pointed to the agreement of copper smelters to establish a price to the Government on copper and declared that had zinc smelters used the same tactics, spelter would have occupied a more favorable position. The willingness of the American Metal Co. to accept 7.75c. per lb. on 5500 tons of spelter, declared this authority, upset the whole brew, as it was shown only too plainly the company was willing to accept a loss on the entire lot in order to work off this quantity of metal. Prices on zinc ore were maintained during the first part of September on the identical basis reported for the month of August, namely, \$70 per ton base for 60% and top-grades of refinery ore, with the range down to \$65 per ton for seconds and lower-grades. A break in prices was seen in the third week, the published figures remaining the same, but local correspondents in the different camps handed in reports that showed declines were imminent, the first decline carrying the base down to \$68 per ton. The last week found top and standard ore at \$67.50 per ton, with the range down to \$63 and the latitude of assays restricted to apply on grades down to 54% zinc. The disposition of producers and refiners to hold for better prices, based on some vague belief that such a contingency was possible, gave way to a calm resignation that prompt marketing was the best policy and shipments of finished ore were much heavier during the latter half of the month. On the lower grades of zinc-concentrate independents found a ready market with the Mineral Point Zinc Co., which did a heavy business at its reduction plants at Mineral Point all through the month. Price offerings were out of tune entirely with the base that carried on the higher-grade ores, but one operator admitted that even at the prices submitted outputting still remained profitable. Powder, steel, and all mining supplies have advanced from 40 to 100%, with the increase in the cost of labor about double that obtaining two years ago. Shovelers are receiving from 8 to 12c. per can of 1000 lb. and some earn as high as \$6 on a single 9-hour shift.

The buying of ores by the Grasselli Chemical Co. of Cleveland was a feature of the month's business, although the total tonnage secured was under the amount shown for the month of August. This company secures most of its mine-output under contract arrangement, but inquiry revealed the fact that sellers were dissatisfied and it is highly problematic what future arrangements will be made, as several important contracts are about to expire. High prices for zinc ore seem destined to become past history; the Cleveland corporation has given ample evidence of recent date that more attention will be given to the finished product obtained at refining plants. Should this programme be realized, increased facilities for zinc-ore dressing will be established promptly. Op-

erators running on lean deposits are face to face with conditions that require extraordinary executive ability and it has been intimated in reliable quarters that several producers will be under the painful necessity of shutting down entirely if present costs of operating continue and prices for zinc ore descend to lower levels.

An item fraught with much interest to mining men is found in the annual tour of mine inspection paid to this field during September by leading officials and mining engineers of the New Jersey Zinc Co. The majority found in favor of continuing the company's policy in this field, and a liberal buying-up programme has been recommended. Mineral lands known to possess merit for mining purposes and mines now in operation and under the control of small independent corporations will come in for early inspection and negotiations designed to transfer ownership and control to the big Eastern zinc syndicate. The liberal attitude of the New Jersey Zinc Co. in dealing with land owners and mining men in the past insures further exploitation in this field that lends encouragement at this time.

Of the several separate establishments in the field only two were content during the month to market iron pyrite in any appreciable quantity; the Linden Zinc Co., with one plant at Linden and another at Cuba and the National Separators at Cuba. Prices showed no change and the total deliveries for the month were less than half that usually reported. At the National Separators a considerable quantity of fine obtained in electro-static separation was carried over. At the reduction works of the Mineral Point Zinc Co. such residue as was obtained was promptly converted to the uses of the acid-making department.

Deliveries of zinc ore, lead ore, and pyrite were made during the month of September by districts as here shown:

District	Zinc lb.	Lead lb.	Pyrite lb.
Benton .....	19,716,000	192,000	.....
Miffin .....	6,252,000	86,000	.....
Galena .....	3,492,000	.....	.....
Linden .....	2,786,000	62,000	.....
Shullsburg .....	1,896,000	.....	.....
Platteville .....	1,754,000	.....	.....
Hazel Green .....	1,650,000	46,000	.....
Highland .....	900,000	146,000	.....
Potosi .....	616,000	50,000	.....
Mineral Point .....	294,000	.....	.....
Dodgeville .....	264,000	.....	.....
Cuba City .....	.....	.....	3,520,000
Total .....	39,620,000	582,000	3,520,000

Shipments of high-grade blende from refining plants in the field to smelters were made during September as follows:

	Lb.
Mineral Point Zinc Works.....	5,548,000
Wisconsin Zinc Roasters .....	3,438,000
National Zinc Separators .....	3,192,000
Linden Zinc Refiners .....	1,008,000
Benton Roasters Co. ....	518,000
Total .....	13,704,000

The gross recovery of crude concentrate from mines for the month aggregated 20,104 tons; net deliveries out of the field 11,707 tons.

Sales and distribution of zinc ore for September showed the following accounting: Mineral Point Zinc Co. 197 cars, 7335 tons; Grasselli Chemical Co. 85 cars, 3134 tons; National Separators 80 cars, 3381 tons; Wisconsin Zinc Roasters 80 cars, 3231 tons; American Zinc Co. 56 cars, 2287 tons; Linden Zinc Co. 40 cars, 1452 tons; Matthiessen & Hegeler Zinc Co. 24 cars,

1148 tons; American Metal Co. 16 cars, 676 tons; Illinois Zinc Co. 12 cars, 511 tons; Lanyon Zinc Co. 10 cars, 364 tons; Benton Roasters 9 cars, 369 tons; and Edgar Zinc Co. 8 cars, 294 tons.

Interesting developments occurred in all of the camps of the field during the month. In the Highland district the New Jersey Zinc Co. was engaged with a large force of men and mules over narrow-gauge tracks in turning gutters and dumps filled with waste of mining operations conducted two and even three generations ago. The sludge recovered proved profitable, assaying as high as 15% zinc. The Mineral Point & Northern Ry. Co. is meeting the increased traffic over its 34 miles of roadway by the laying of 90-lb. rail. In the Linden district the Optime company is showing heavy returns from mine No. 3. Spring-Hill Mining Co. is driving an adit to connect with an orebody struck by borings on the Ross lease. The Milwaukee-Linden Development Co. completed a new shaft on the Thompson prospect but was driven out by heavy overflow, and heavier pump equipment is being supplied. Another shaft is being sunk on the Kickapoo lease. Producers of low-grade zinc ore received during the month an average of \$17 per ton for 25% zinc concentrate; \$24 for 30%; \$35 for 40%; \$68 for 60%. The Linden Zinc Refining Co. ran steadily all the month, making recoveries in excess of 60% zinc. Drilling outfits were engaged on the Rolling lease for the Optimo Mining Co. Labor was well paid, breast-men receiving \$3.50 per shift; muckers \$3; shovelers 8c. to 12c. per can (1000 lb.); hoist-men \$3.25; foremen \$125 to \$175 per month; machine men \$4 per shift; blacksmiths \$3.50; dynamiting crews \$3 each; teamsters \$6 per day of 8 hours. There is a labor shortage.

The Mifflin failed to show as well as for August by an even 1000 tons of concentrate. The principal producers were the Yewdall and Coker mines. A new producer called New Phoenix made regular shipments; the Big Tom mine increased its deliveries and paid a monthly dividend of 25%. The Grunow, Peacock, Lucky Six, Biddick, and B. M. & M. mines operated steadily all month and made shipments at intervals. The Billings mine, a new development opened on the Bourett farm, made its first shipment.—The Block-House Mining Co., paid a 100% dividend during the month, making 570% since January 1, 1917. Additional leaseholds secured by the Block-House Mining Co. adjoining the present producer have been exploited by drills with gratifying results.

## MANHATTAN, NEVADA

### WHITE CAPS.—MANHATTAN.—UNION AMALGAMATED

Since last week's report, the east orebody has been exposed on the fifth level of the White Caps. The hanging-wall side of the ore was first struck by the south cross-cut, although the cross-cut was entirely in ore. After driving for 25 ft. along the vein, the course was changed to cut the ore at right angles toward the foot-wall. This cross-cut has now been extended 15 ft. and there is no sign of the foot-wall. The first sign of calcite which has been prominent in the heart of the vein in the upper levels was noted on October 4. As mentioned in last week's report, the main portion of the orebody is still farther ahead of the cross-cut from the fifth level, as is distinctly shown on the maps of the underground workings. However, judging from the size of the vein already exposed, with neither wall yet uncovered, it is practically a certainty that the bottom workings are going to prove the east orebody

considerably larger in size than on the fourth level. Each foot of work along the vein on the bottom level is adding many tons to the known ore-reserves in the mine. Between the third and fourth levels the ore-reserves in the east orebody alone adds over a million dollars to the value of the White Caps, and the present development should more than equal this amount. The weekly amount gained from the various levels in the property, brought up to date, is as follows: From the third level, the hanging-wall cross-cut gained 30 ft., now a total of 74 ft. A new drift east has been started during the week and 12 ft. has been made. From the fourth level, raise 405 is breaking the records for rich ore, seven feet next to the foot-wall assaying \$35. This raise has been extended 26 ft. and is now up a distance of 135 ft. from the level. From the fifth level, the south cross-cut has been advanced 37 ft., and is now 292 ft. from the station. The total for the above work shows 105 ft. made since last report. The same average daily tonnage of ore has been maintained for the mill. In the White Caps mill a set of rolls has been added to equipment above the roaster for secondary grinding, to bring the entire product to under 6-mesh size before passing into the

CALUMET-NEW MEXICO SHAFT AT PINOS ALTOS

roast. A clean-up of the zinc precipitate in the zinc press has been started so that before long the first gold bars should reach the mint from the milling operations.

Driving east from the fourth level in the Manhattan is progressing with two shifts. The face of the drift is now 50 ft. from the shaft. The east orebody should be struck at 250 ft. From the third level, the south cross-cut has been extended from the point where development work ceased some months ago, and now the face of the cross-cut is 150 ft. from the point in the east drift where the cross-cut was started. A raise will shortly be extended from this cross-cut to the second level and thus assure ventilation. The raise will also serve to develop the high-grade orebody already proved from the second level to the surface.

The footage made in the Union Amalgamated during the past week is reported as follows: From the 600-ft. level, the north cross-cut on the fissure made 19 ft., No. 11 north cross-cut east made 30 ft., the south cross-cut on fissure extended for 27 ft.; the total footage made in above workings being 76 ft. The face of the north cross-cut is in quartzite. The north orebody should be found in the continuation of this work in 10 to 15 ft. Gold is now showing in the seams found in the face. No. 11 north cross-cut is still in ore of low grade and considerably broken. This cross-cut has been extended through the Earl ore-shoot and has proved the orebody to be at least 30 ft. from hanging to foot-wall. About 10 ft. of the ore showing in this work is high-grade. The south cross-cut on the fissure

has demonstrated a large tonnage of ore. The continuation of this cross-cut will cut the hanging-wall contact in about 20 ft. It is expected that another valuable orebody will be exposed, as the present work should cut the extension of the orebody developed along the contact from the 350-ft. level of the Earl.

### VANCOUVER, BRITISH COLUMBIA

#### GRANBY CON. DIVIDEND.—PRINCETON MINING AND DEVELOPMENT

In the fiscal year ended June 30, Granby Consolidated Mining, Smelting & Power Co. earned \$5,452,796 from all sources, or \$36 per share. This compares with \$25 earned in the preceding fiscal period.—With the starting of the new mill at the Surf Inlet the gold production of British Columbia will be increased by about \$1,000,000 per year. This is equal to an increase of 25% on the present output of lode gold. The mine has 11,000 ft. of development work done, the main, or 550-ft., level is 3000 ft. long, and develops two veins. From this level a shaft has been sunk to a depth of 285 ft., from the bottom of which levels have been driven 600 ft. Above the main level, intermediate levels have been driven at 430 and 320 ft. respectively. The west vein has been developed by five and the east vein by four levels. The west vein averages 18 ft. and the east vein 5 ft. on these levels. The orebodies occur as lenses along the course of the shear-zone, one lens having a length of 700 ft.—The main working-level is equipped for electric haulage, the cars being dumped into the crusher-bins. The ore averages \$11 per ton in gold and 385,320 tons has been developed. The mill is of a type entirely new to this country; ball-mills and tube-mills replacing the customary stamps; the tailing is treated by flotation. The concentrate will be shipped either to Tacoma or the Selby smelter. While the mill has a present capacity of 300 tons per day it is probable that after the War it will be increased to 1000 tons, and the concentrate will be treated at the mine as is being done at Hedley.

The Princeton Mining & Development Co. has been incorporated to develop the Copper Farm group, recently acquired by F. F. Foster and associates from Col. Stevenson. The capital of the company is \$150,000 and the head office is at Princeton. F. F. Foster, president; Perley Russell, secretary-treasurer; and Guy Murphy form the directorate. The property is about five miles below Princeton and is traversed by the Great Northern railway. It is fairly well developed; assays of the ore run from \$33 to \$174.—Nearly 500 tons of concentrate and crude ore has been shipped from the Florence silver mines at Ainsworth during the month of September.

### COBALT, ONTARIO

#### BEAVER CONSOLIDATED.—MCINTYRE.—PORCUPINE CROWN.

The outlook at the silver mines at Cobalt continues exceedingly bright, ore shipments for last week totaled 18 cars containing 1,250,000 lb. as compared with 1,500,000 lb. during the preceding week. It seems likely that September shipments will be the highest during the year.

Development at the Beaver Consolidated is resulting in the recovery of high-grade ore. One ore-shoot at the 600-ft. level, 130 ft. long, though narrow, contains 3000 oz. per ton. This company is also operating the Kirkland Lake Gold and has paid \$200,000 toward the purchase of the mine and spent \$100,000 in development. Only \$70,000 remains owing.

It is estimated that ore to the value of \$500,000 is blocked out. The capital of the Buffalo has been reduced from \$1,000,000 to \$750,000. The shareholders are to receive 25c. and a share of the new issue for each share of the old, the par value of which will be 75c. instead of \$1. This disbursement of \$250,000 makes a total of \$3,037,000 paid to the shareholders in this company. The oil-flotation plant at the Buffalo is treating the huge pile of old tailing at a fair margin of profit.

Developments at the 400-ft. level of the McKinley-Darragh

has revealed considerable ore. Further cross-cutting is under way, and one of the main veins showing at the 300-ft. level is expected to be cut at any time. The deal for the old Alexandra property is still pending, and will probably not be decided before the first week in October. The Chambers Ferland continues to yield fair quantities of ore from the zone just above the contact.

The Genesee is being explored by cross-cut just above the contact at a depth of 550 ft. in the hope of picking up extensions of the Chambers Ferland veins.—The O'Brien mine is yielding \$100,000 per month, and the ore-reserve is several years ahead of production.

The main drive on the 1000-ft. level in the McIntyre is now about 200 ft. on Jupiter ground. The Jupiter shaft, 1800 ft. farther east, has reached a depth of 840 ft. The management plans to connect this long drift with the Jupiter shaft which is being sunk toward that level. A force of 230 men is employed and there appears to be no reason why the present interim dividends of 5% quarterly should not be maintained. The annual meeting is being held at Toronto.

The Hollinger is now employing nearly 1000 men. Extensive development is being done, and it is expected that the ore-reserves at the end of 1917 will be \$40,000,000. The centralization of work has improved conditions considerably and will cheapen the cost of production.

### SPOKANE, WASHINGTON

#### INTERSTATE-CALLAHAN.—ELECTRIC POINT.

War taxes, which must be paid out of this year's earnings, will cut heavily into mine dividends of the Inland Empire. The first example is given by the Consolidated Interstate-Callahan Mining Co., operating in the Coeur d'Alene, whose directors suspended the dividend for the current quarter. The president of the company, J. A. Percival, says:

"The directors decided that the uncertain outlook, due to the War, and the increased cost of production, together with the necessity of providing for heavy war taxes, make desirable the creation of a strong reserve, the reserve to become a protection against any emergency. The war tax is approximately \$300,000, estimated under the provisions of the statute as now drawn. It must be paid out of the 1917 earnings." Other strong corporations of the Coeur d'Alene are preparing to do their bit for Uncle Sam, according to reports. The work of arriving at figures is being facilitated by a corps of government statisticians. On a basis of 20%, mines of the Coeur d'Alene would contribute \$2,400,000, if the earnings this year were the same as those of 1916.

Washington mines contributed ore worth \$65,000 to the smelter of the Consolidated company at Trail, B. C., the last week of September. The output aggregated 1086 tons, divided as follows:

	Tons
Quilp, Republic .....	200

Nearly 500 tons of concentrate and crude ore was shipped in September from the Florence Silver Mining Co. at Ainsworth, B. C. A dividend of \$118,960, making the total to date \$166,530, has been declared by the Electric Point Mining Co., of Northport, Wash., and \$30,000 will remain in the treasury after the disbursement is made. The mine from which these profits were taken was discovered only two and a half years ago. The latest disbursement is at the rate of 15c. per share on the issue of 793,500 shares. Three cents of it is the regular quarterly dividend and 12c. an extra.

# THE MINING SUMMARY

## ALASKA

(Special Correspondence.)—K. I. Fulton, of the Talkeetna Mining Co., operating in the Willow Creek district, is in town with the first clean-up of the company amounting to \$2000. The clean-up is the result of a 140-hour run in a Denver quartz mill. Gold from Cook Inlet district sent to the U. S. assay offices at Seattle for the fiscal year ended June 30, amounted to \$406,000.—The Willow Creek Development Co., a local company formed to exploit mines in the Willow Creek district, has elected the following officers and directors: J. E. O'Reilly, Charles Herron, Leopold David, George M. Campbell, and A. E. Lathrop. Capital stock is \$100,000. The stock is being placed on the market at 50c. per share.—L. H. French has bonded a number of claims in the vicinity of the Mabel mine and will begin active development in the spring.—A rain and wind storm on September 11 and 12 caused great damage to Seward by destroying the lighting-plant and also a number of buildings and bridges. The Crow Creek Mining Co., at Glacier Creek, estimates its damage at \$100,000. Two miles of track on the government railroad was washed out near Mile 34, and some machinery was destroyed. Pearson camp lost its entire clean-up.

Anchorage, September 15.

(Special Correspondence.)—J. C. Murray, in charge of the Cache Creek, where a dredge was started in the fall of 1916, is in from the camp, and reports a good season, although forced to suspend work earlier than anticipated, on account of excessive rains which raised the water in the streams and inundated much adjacent ground. He reports that the many independent operators have had a satisfactory season, but lays stress on the necessity for roads to lower the present excessive cost of transportation. However, Ross Kinney is making a preliminary survey for the Alaska Road Commission with a view to building a wagon road from Talkeetna to Cache Creek. A trail will be built probably this winter.—Frederick Spengler, an engineer who recently returned from a reconnaissance in the Indian Creek district, 50 miles up the Talkeetna river, reports that section as presenting an attractive field for the exploitation of smelting ores which are in proximity to hydro-electric power and fluxing materials, and which have the further advantage that a railroad could be easily and cheaply constructed to them.—Herschel C. Parker, of New York, who has been in charge of the examination of placer ground on the Kahiltna river, reports that platinum is generally distributed in the wash of streams in the mountains about Mt. McKinley, and indications are that the combined gold and platinum is sufficient to justify the exploitation of these gravels on a big scale. K. B. Mertie, government geologist, has been instructed to investigate, and is now on the ground.

Anchorage, September 24.

## ARIZONA

### COCHISE COUNTY

(Special Correspondence.)—The milling machinery of the Commonwealth Mining & Milling Co., part of which has been sold to the United Verde Copper Co., at Jerome, is now being removed. The Commonwealth will erect more suitable ma-

chinery immediately. Owing to the high price of silver the old tailing is being treated by A. T. Smith and associates. Cross-cutting has been started on the 300-ft. level to prove in depth the recent surface strike. Samples from this strike, taken over a width of 10 ft., assayed \$25 per ton.

Bisbee, October 6.

### MARICOPA COUNTY

(Special Correspondence.)—A number of men from Mesa and Tempe have acquired a lease on the Buckhorn and Boulder mine. The shaft has been re-timbered. A company is to be formed to finance the equipping and developing of the property.

Phoenix, October 5.

### MOHAVE COUNTY

(Special Correspondence.)—Fire of undetermined origin destroyed the mill of the Union Basin Mining Co. at Golconda, 15 miles north of Kingman. The loss is estimated at \$100,000; zinc ore was treated at the mill. The company employed 300 men.—At a meeting of the Amalgamated Gold Mining Co. at Oatman it was decided to sink 200 ft. deeper, to the 500-ft. level, and carry on development.—Sinking to the 500-ft. level and driving on the Leland property will commence shortly. Work is progressing on the Gold Bond mill, which is being repaired by the Gold Ore Mining Co. The Gold Ore shaft is being re-timbered and preparations are being made to mine and mill 100 tons per day. Machinery, consisting of 100-hp. hoist, compressor, and 500-ton milling plant, is expected at Kingman for the Frisco Gold Mine Co. The providing of these improvements resulted from the discovery of a large quantity of \$10 gold ore in the Gold Dome claims.

Kingman, October 6.

### PIMA COUNTY

(Special Correspondence.)—A petition to permit the optional sale of the G. B. McAneny placer mine to A. J. Taylor of Denver for \$200,000 has been made by his trustees.—Suit against T. Childs, alleging damages of \$75,000 for refusal to deliver the Iron Reef, Apex, and Rambler claims of the Cardigan property at Ajo, has been filed in the Superior Court by H. E. Fredrickson.—As the result of a rich strike of lead and copper ore the Black Prince group, 87 miles south-west of Tucson, in the Quijotoa mining district, has been leased.—The San Xavier Extension has commenced shipping galena and chalcopryrite from the 200-ft. level.

Tucson, October 6.

### PINAL COUNTY

(Special Correspondence.)—The Ray Consolidated Co. has subscribed \$1,000,000 to the second Liberty Loan.—It is announced by H. S. Bryan that a contract has been let for the erection of a 50-ton mill for the United Vanadium Development Co. near Kelvin Junction. Part of the machinery is now being shipped from Denver. It is estimated that there is sufficient ore on the dumps to operate the mill for two years.—A rich ore-shoot in the west drift on the 105-ft. level of the Gila Development Co. has been found. The ore is free-milling quartz, a sample taken over three feet assayed \$133 per ton. The Cave Spring Co. has been doing extensive development work during the past nine months, and plans are

now under way for the erection of a mill and cyanide plant. Pending the erection of a mill all high-grade ore will be shipped.

Florence, October 5.

#### YAVAPAI COUNTY

(Special Correspondence.)—The Venture Hill has resumed sinking. This property has been closed-down since the strike last May. When work ceased good showings of chalcopryite and bornite had been uncovered in the shaft. Machine drilling has commenced in the adit of the Jerome Copper Co.'s property, which was formerly the Ewing and Hooker group. It is proposed to reorganize the Jerome Victor Copper Co., under the name of the West United Verde Copper Co., with a capital of \$5,000,000. John H. Banks of New York has been engaged as consulting engineer.

Prescott, October 6.

(Special Correspondence.)—The management of the Big Ledge Copper Co. announces that construction work will be commenced on October 1 on the smelter, and three shifts are to be put on at the Butter Nut and Henrietta mines. A 50-ft. vein, all milling ore, has been opened on the 200-ft. level of the Butter Nut. The company also expects to handle custom ore.—It is expected that the copper output of the Arizona Binghamton property will be between 300,000 and 400,000 lb. for the month. The first unit of the mill has been operating a year, the second unit was started a month ago. The company plans the sinking of a larger shaft in order to increase the production. A new shoot has been discovered on the 200-ft. level.—The Copper Queen mine, which adjoins the Arizona Binghamton on the east, is planning extensive development in view of the proposed flotation plant which is to be erected at the mine. This company already has some 35,000 tons of ore blocked in the upper levels. Some of the old workings have been unwatered and sampling is being done. The stopes in the mine are 20 ft. wide. Work is being resumed by the Half Moon company immediately south of the Copper Queen. A new hoisting plant has been erected. The Pochontas has resumed operations; a flotation plant is to be erected.—The Barbara mine, leased by Bisbee men, is driving an adit to tap an orebody recently opened by them in a shaft 300 ft. above. It is understood that the report is favorable on the Harvard and Yale, Iowa, and Celebration mines, which were examined during the first part of the month by a Chicago engineer.—The Ventura Hill Co. has arranged to raise \$25,000 for development. Sinking in the 200-ft. shaft will be continued.—The Jerome-Anaconda Copper Co., with a capital of \$2,000,000, has been formed to develop 32 claims, belonging to T. Bresnahan, in the Yeager Canyon district.—The Green Monster Co. has just erected a new hoist at the Dorothy May shaft.—The Jerome Verde will erect a 750-cu. ft. compressor. Last month this company drove 550 ft. of development work. Driving will be started on the 600-ft. level of the Verde Combination. Cunningham Smith and Black of El Paso are drilling for oil at China valley.—L. P. Morgan of New York has just completed an examination of the Lucky Five in Copper Basin and has reported favorably.

Prescott, September 28.

#### YUMA COUNTY

(Special Correspondence.)—C. Flynn and associates have just purchased from H. B. Hanna of Boise what appears to be a large deposit of manganese, situated in the north of this county.

Yuma, October 5.

(Special Correspondence.)—The water in the shaft of the Silver King mine has been lowered 220 ft., only 30 ft. remains to be unwatered. Timbering and repairing are following the unwatering closely. Systematic development is to be carried on prior to starting the mill. For this work a 50-hp. Fair-

banks-Morse engine, a 12 by 10 Ingersoll-Rand compressor, a hoist, Cameron pump, and 25-hp. West Coast engine have been erected. An electric-light plant for lighting the surface buildings has been completed. Three motor-trucks are in service hauling supplies. The road from the mine to the railroad siding, three miles away, has been completed. From two drifts in the upper workings some good ore has been obtained, assaying as high as \$100.—The Queen Creek Copper Co. has uncovered a lode in the bottom of the 300-ft. shaft, which assays \$100 in gold and 15% copper. This company is controlled by Scotch capital.—Fire starting from an explosion of gasoline consumed the hoist and compressor buildings of the Mammoth Development mine, at Mammoth, and burned its way down the shaft. The men escaped through another shaft. This mine had just reached a dividend-paying basis. It is planned to continue operating part of the mill on 10,000 tons of dump-ore. The Old Collins shaft will be opened and used until re-equipment is finished.

Florence, September 29.

#### CALIFORNIA

##### CALAVERAS COUNTY

(Special Correspondence.)—At the Safe Deposit mine in Old Woman's gulch preparation is being made to turn on the water for a winter's season. About 700 in. of water will be played against the bank and the gravel hoisted from the pit by hydraulic elevators. The debris dams were completed some months ago and were passed by the Debris Commission engineers.—Reports from the Mokelumne group of mines, operated by Max Muller of Los Angeles, are satisfactory. A Joshua Hendy ball-mill was erected last fall. The mill is running two shifts and the company is preparing to sink 500 ft. The force employed at present is 35 men.—The Buffalo gravel mine in Chili gulch has unwatered the shaft and re-timbered it. The mill will be operating at capacity shortly.—Shortage of Miners is hindering work in this section, but the outlook is good. A rich body of ore has been struck at Gold Cliff. It is reported, also, that the Lightner mine will be reopened shortly.

Mokelumne Hill, October 1.

##### NEVADA COUNTY

(Special Correspondence.)—The orebody lately uncovered on the 500 and 700-ft. levels of the Golden Centre is developing well and the management believes it persists to the surface. Unwatering of the lower levels is proceeding steadily and, as soon as conditions permit, the vein will be sought at a lower depth. The shaft will be sunk to 2000 ft. and the Peabody group developed.

The Grass Valley Consolidated Co. has put in a centrifugal pump on the 500-ft. level of the Allison Ranch mine and is rapidly unwatering the levels below this point. The pump has a capacity of 500 gallons per minute. Ore for the mill is being drawn from the 500 and 700-ft. levels. The 20-stamp mill is running one shift.—The smallpox quarantine on the mine and plant of the Columbia Consolidated, near Washington, has been raised. In the Ocean Star section of the group, excellent ore is being mined and sent to the mill. The shaft is down 300 ft. and good ore is exposed in the lower workings.—The Washington Asbestos Co. has overhauled the old Fairview mill and will soon have it operating on asbestos. The flume-line has been repaired and everything around the mine placed in shape for a steady output. The asbestos is stated to be of fine quality; it will be shipped to San Francisco. Oakland and San Francisco people are interested chiefly.

The Black Bear Mining Co. is pressing work steadily at its gold property in the Rough & Ready district and is developing some promising ore. William Bucholz has been re-elected president and manager, and M. Shaver secretary.

Grass Valley, October 15.

**SHASTA COUNTY**

(Special Correspondence.)—The Afterthought Copper Co. at Ingot has shut down its oil-flotation plant while alterations and enlargements are being made. The operation for over a month demonstrated the success of the process on the zinc-copper ore. The shut-down will be for only two or three weeks. One hundred men are employed in the mine.

The Yankee John Development Co., operating the Yankee John mine, four miles west of Redding, contemplates building a cyanide plant. It has condemned its cannon-ball mill. An oil-flotation plant is contemplated. The company is making extensive improvements, having just put up a new head-frame and built a new shaft-house, boarding-house, and assay office. T. E. Graff of Redding is superintendent.

Redding, October 11.

**COLORADO****CLEAR CREEK COUNTY**

(Special Correspondence.)—The Primos Chemical Co. has resumed work on its molybdenum properties at Camp Boericke, near Empire. A contract has been let to S. Knowles to drive the main adit at the base of the mountain, 2000 ft. The adit is now in 500 ft. Grading is under way for a 200-ton mill. The milling machinery will consist of crushers, ball-mills, with tube-mills for re-grinding, followed by a series of flotation units. A. R. Nuimer is in charge of the work. An aerial tramway from the upper workings will be erected to serve the mill until the adit is completed, when electric hauling will be used.—The Central Colorado Power Co. is putting in a power-line to the mines to supply light and power for all purposes.—The Argo Leasing Co. is erecting a 50-ton concentrating mill to treat the silver-lead-zinc ore recently opened up.—The Sceptre Tunnel Co. has completed the re-timbering of its adit and the raise to the Sunburst adit is nearly finished. Several of the old stopes contain good ore. An aerial tramway from the mine to the railroad at the base of the mountain, a distance of 6000 ft, is to be erected. An electrically-driven air-compressor and drills will be added. J. H. Lewis is manager.

Georgetown, September 29.

**IDAHO****BONNER COUNTY**

The No. 3 adit of the Armstead Mines, Inc., on Lake Pend Oreille, was advanced 366 ft. in September. This is believed to have made a record for the district. It increases the length to 1748 ft. and adds 607 ft. since the middle of August. The adit was driven 26 days in September, or at the rate of a little more than 14 ft. per day of 24 hours, operations having been interfered with on two of the remaining days by the employment of the crew in fighting a forest fire. Two drills were run on 19 days and one drill on 7 days. Two machine-men and a helper, four or five muckers, and a motorman were employed on each shift. One man prepared the powder for all shifts and performed other work, and the steel was sharpened by one crew, using a Leyner machine. The muckers extended ventilating pipe, the air and water lines, track, and ditch.

**MONTANA****SILVER BOW COUNTY**

(Special Correspondence.)—The North Butte Mining Co. has declared a dividend of 25c. per share on 430,000 shares of the outstanding capital stock of the company; the Barnes-King Development Co., a dividend of \$40,000, being 10c. per share, and the Butte-Bullwhacker Mining Co. a dividend of \$10,000, being 1c. per share.—At a meeting of the stockholders of the Montana-Canadian Oil Co., held at Butte this week, the stock, which is owned mainly in Montana, was turned over

to C. F. Kelly and associates of the Anaconda Mining Co. The action, which is described as a sale, amounts more nearly to a merger of the Montana-Canadian with more powerful financial interests; the Montana-Canadian stockholders receiving their pay in stock in the new company, which will be organized as a foreign corporation. In taking over the Montana-Canadian, Mr. Kelly and his associates are said to have in mind plans involving an expenditure of between \$10,000,000 and \$15,000,000 for development of the gasfield at Sweet Grass, Montana, and construction of pipe-lines to Great Falls, Helena, Butte, and Anaconda. The gas is to be used for lighting and heating purposes, and also at the smelters at Great Falls and Anaconda. The new corporation will be organized by C. F. Kelly and will be capitalized at \$15,000,000. The oil and gasfield, which will come under the control of the Anaconda Copper Mining Co., comprises 120 square miles near the town of Sweet Grass. There are two flowing wells with a capacity of 8,000,000 cu. ft. per day; one well being 1850 ft. deep, the other 2500 ft. In this field 1100 to 1300 ft. of shale is found on top of the gas-sand. It is said that this field is an extension of the Bowisland range, in which is found wells that have been flowing for 28 years.

Butte, October 6.

**NEVADA****LANDER COUNTY**

(Special Correspondence.)—The Gold Top Mines Co. is erecting a small mill at its group of gold-mining claims near Galena, and expects to have it in operation by November 15. Sufficient ore is exposed to insure a long period of production.—The Nicholas Mining Co. is preparing plans for a cyanide mill to treat its silver-lead ores.—The Antimony Silver Mining Co., controlled by Salt Lake people, is operating a small mill on gold ore.

A 3-ft. vein, assaying \$100 in silver and lead, with a little gold, has been opened by John Clifford, John T. Martin, and O'Toole Bros. near Washington canyon, south of Austin, in the San Juan district. An examination of the deposit is being made on behalf of Eastern capital by J. L. Bryson.

Austin, October 14.

**MINERAL COUNTY**

(Special Correspondence.)—Several properties in the Luning field will soon be shipping to the enlarged sampling-plant, just completed at Hazen by the Western Ore Purchasing Co. The plant has a capacity of 900 tons daily, and, wherever possible, has been equipped with automatic machinery.—The R. B. T. Co. has arranged for a shipment of two carloads of \$40 gold-silver ore to the Belmont mill, Tonopah, and expects to ship steadily henceforth. From 5000 to 7000 tons of \$20 ore has been opened on the Cevita and Abe Lincoln claims in addition to a large quantity of shipping product averaging \$40 per ton. Connections have been established between the Meyer adit and Edith shaft, and driving is proceeding on the main vein, which has been cut at various points along its strike. At the adjoining Luning-Idaho group teams are being assembled for transportation of copper ore to Luning, and from there it will be sent to custom smelters by rail. The shipping product ranges from 8 to 25% copper and carries some silver and gold. The Stockham adit has advanced 100 ft. in low-grade oxidized ore and penetrated the sulphide zone at a depth of 100 feet.

Some excellent silver-lead ore has been uncovered in the June Bug. The property is controlled by W. E. Casson and George Hedges of Carson City, and San Francisco associates. The Packsaddle group of gold-silver claims has been examined by San Francisco people. Good ore is developing in the Mountain View and the small mill is running steadily.

On the 180-ft. level of the Nevada Rand, six to eight feet of \$80 silver-gold ore has been opened by a cross-cut in the

foot-wall. Driving for the main orebody is proceeding from the 350-ft. level.

Luning, October 14.

#### NYE COUNTY

(Special Correspondence.)—The Liberty Mining Co. is erecting a 10-stamp mill at its gold property near Willow Creek. Milling-ore has been exposed at several points, and small quantities of high-grade quartz. Driving of an 80-ft. adit has begun to tap the main ore-shoot.

Tonopah, October 13.

(Special Correspondence.)—The Tonopah Mining Co. the past week produced 2200 tons of ore. At the Silver Top, Sandgrass, Mizpah, and Red Plume shafts 225 ft. of development was made. At the Silver Top shaft stoping on the smaller veins furnished considerable tonnage.—Cross-cutting south on the 1680-ft. level at the Victor shaft of the Tonopah Extension Mining Co. has not been resumed on account of the flow of water encountered last week. The vein that was intersected appears to have a flatter dip and a different strike from the Merger vein, but may prove to be that vein. The ore assays about \$20. In the Victor territory, 167 ft. of development was made and 68 ft. in No. 2 shaft. Last week's production was 2380 tons. The bullion shipment for the second half of September consisted of 25 bars valued at \$53,500.

The Tonopah Belmont will dismantle the reduction plant at Millers. A part of the equipment will be sent to the Eagle-Shawmut mine in California, and the remainder to the Belmont-Wagner Mines Co. at Telluride, Colorado. A sampler and conveying system are being added to facilitate handling of custom ore by the Belmont mill. Cross-cutting from the S88 east drift has been started to pick up the faulted segment of the Shoestring vein. The intermediate east and west drifts from stope No. 3 on the Belmont vein continues on a full face of fair-grade ore. The tonnage the past week was 2320 tons.—The West End mill shipped 31 bars of bullion, valued at \$56,333, which represents the clean-up for the last half of September. In the Ohio territory, cross-cut 512 continues in high-grade ore. The hanging wall of the vein has not been reached. Drift 526 continues in excellent ore, while drift 525 is in low-grade material. Raise 529 is in the foot-wall of the vein. The shipment the past week was 967 tons.

As the Jim Butler Tonopah Mining Co. ships its ore to the Millers plant of the Tonopah Belmont, the Belmont mill will treat the Jim Butler ore when the plant at Millers is dismantled. The shipment the past week was 700 tons.

The McNamara Mining Co. has confined its stoping operations to the 700-ft. level, stope 1, where a 5-ft. face of ore is exposed, and stopes 1 to 4 on the 300-ft. level.

Stoping on the raise from the 950 to the 1050-ft. level in the North Star has progressed in good ore. About 50 tons of ore was sent to the West End mill.—Last week the Rescue-Eula produced 133 tons of ore, the Montana 239 tons, and miscellaneous 5 tons, making the week's production at Tonopah 8944 tons with a gross value of \$156,520.

At the Kanrohat property in the Round Mountain district, recently purchased by S. H. Brady & Co., the stamp-batteries are being replaced by ball-mills and combined cyaniding and flotation will be used. Jay A. Carpenter will be in charge of the mill operations.

In the issue of September 29 it was erroneously stated that the adit at the Con. Spanish Belt Co. has discovered ore. Only a few small stringers of low-grade quartz have been cut by this adit.

Tonopah, October 15.

#### WASHOE COUNTY

(Special Correspondence.)—A recent discovery was made at the bottom level of the Wall Street mine at Luning when a short cross-cut was driven into the foot-wall and a 4-ft. body

of high-grade ore was opened which averages 30% copper. The company has a force of 75 men, and is doing extensive development as well as producing ore.—A winze has been sunk 20 ft. on the high-grade orebody opened up on the 1000-ft. level of the Calavada Copper Co. with no change in the character of the ore. A cross-cut is being run from the 1100-ft. level, to get under this ore, and a connection will be made by putting up a raise.

The main working adit of the St. Patrick mine, owned by the Kirchen Mines Co., is in 750 ft. and has found high-grade shipping ore, although from surveys made of the ore-shoots in the upper workings it was not expected to reach this ore for another 25 ft. Near the face of the adit a raise has been put through and connections made with the upper workings; this will do away with hoisting to the surface from the upper levels. Development has been started on a 6-in. stringer that was found in a body of iron gossan 250 ft. from the mouth of the adit. In 10 ft. this stringer has widened to 3 ft. of high-grade ore which assays from 10 to 12% in copper.

Reno, October 11.

### NEW MEXICO

#### SOCORRO COUNTY

(Special Correspondence.)—The Socorro M. & M. Co. clean-up for the last half of September amounted to twenty-one 100-lb. bars of bullion. Twenty men are now at work on the road to Whitewater power-plant, which is being put in condition for heavy freight.

The governor, state engineer, and others have made an inspection trip over the new wagon-road between Mogollon and Socorro and it has been decided to put a large force of men to work and complete this road.

The Oaks Co. is now mining and milling \$17 ore on the Deep Down mine, one of the central group. This adds another shipper to the district and makes the fourth property of the Oaks central group that is maintaining regular production. Auto-truck transportation to mill is under consideration, as there are not enough burros in camp to handle the production.

Mogollon, October 9.

### OKLAHOMA

#### OTTAWA COUNTY

A subterranean cavern lined with lead and zinc ore has been struck by the Admiralty Zinc Co., in its mine at Douthat. The cavern is 75 by 20 by 12 ft. and presents one of the most spectacular sights seen in many a day.

The Montreal Mining Co., at Douthat, is shipping 350 tons of ore per week. This is an old mine that has been re-opened by Canadian capitalists who have equipped it with a modern plant. Comfort for the men, in the way of shower-baths and comfortable bunk-houses, is a pleasing feature.

### OREGON

#### DOUGLAS COUNTY

(Special Correspondence.)—The Elkhart quicksilver mines, nine miles south-east of Yoncalla on the Southern Pacific railroad, on which \$75,000 was expended in development and plant fifteen years ago, was taken over early in 1917 by E. P. Perrine and H. L. Marsters of Roseburg. The plant has been reconstructed and the mine is being re-opened. The ore is said to run 10 to 12 lb. of quicksilver per ton.

Roseburg, October 6.

#### JOSEPHINE COUNTY

(Special Correspondence.)—J. M. Finch and T. P. Johnson are mining chrome ore near Kerby and will begin shipping soon. Their property is west of Kerby, across the Illinois river, and, there being no bridge at that point, they are endeavoring to get as much ore as possible before the rains come.

Kerby, September 26.

## UTAH

Earnings of Utah Apex Mining Co. for the three months ended with August were as follows:

	Receipts	Expenses	Net
June .....	\$88,345	\$60,652	\$27,692
July .....	144,928	83,033	61,894
August .....	215,932	110,013	105,919
Total .....	449,206	253,699	195,506

The consistent increase in tonnage mined, which is now averaging approximately 550 tons of crude and milling ore per day, has not been secured through the sacrificing of development work, the ore-reserve today is in excess of the amount in sight at the beginning of the year.

Cash on hand on August 31 amounted to \$449,000, not including \$100,000 American Foreign Securities 5% bonds and \$30,000 United States Liberty Loan 3½ bonds.

The May Day mine at Tintic is showing interesting development on the 700-ft. level, according to J. C. Dick, the manager. In a level being run in the east end of the mine, the vein has widened to about three feet, showing a streak of ore averaging 15 oz. silver and 20% lead per ton.

The mines of Alta were never more active than at the present time. The output of six mines alone is close to 250 tons per day. The Sells, South Hecla, Michigan-Utah, Columbus Rexall, Emma, and Peruvian are all contributing largely to the camp's output. The Emma Con. is producing 65 to 70 tons per day, the ore running \$35 to \$80 per ton.

## TOOELE COUNTY

Approximately 5000 tons of ore was shipped from Gold Hill station in the Deep Creek district during the month of September. Of these all but five were sent out by the Western Utah Copper Co.; the Pole Star shipped three cars, the Garrison Monster one, and one came from the Copperopolis. Most of the ore shipped by the Western Utah Copper averaged between 4.5 and 5% copper, with 5 to 6 oz. of silver per ton. The Pole Star company shipped two cars of copper-silver ore and one of bismuth and copper. The Copperopolis shipment was second-grade ore which carried about 9% copper, 10 oz. silver, and 10.50 gold per ton. The shipment from the Garrison Monster was low-grade lead ore.

Ores carrying rare metals have been reported by the Seminole Copper and Wilson Con. companies of the Deep Creek district. The shipment included 20 tons of molybdenite ore and 10 tons of tungsten ore from the Seminole property and 20 tons of bismuth ore from the Wilson Consolidated.

## WASHINGTON

## FERRY COUNTY

(Special Correspondence.)—The ore shipments from the Republic to smelters during the week ended September 28, were as follows: Knob Hill mine 150 tons; Lone Pine, by Northport Smelting & Refining Co., 650 tons; Quilp mine, by lessees, 550 tons; Last Chance mine, by Lone Pine Consolidated Mining Co., 90 tons.—In the Last Chance mine a drift is in progress from the bottom of the new 500-ft. shaft to connect with the old stopes. The old workings are full of water. The drift is within a few feet of old workings.—In the Lone Pine 50 men are employed.

Work has been delayed in the Knob Hill mine by a shortage of distillate for the hoist and compressor. Eighteen men are employed on two shifts. The cross-cut from the new 200-ft. shaft is within 40 ft. of the main Knob Hill vein. When this is cut a raise will be carried up to the old stope and the cross-cut will be continued to the rich and smaller vein.—The workings in the Princess Maud mine below the adit-level are being drained.

Republic, October 6.

## PERSONAL

Note: The Editor invites members of the profession to send particulars of their work and appointments. This information is interesting to our readers.

J. S. BROWN is in San Francisco.

JAMES M. HYDE has returned to San Francisco.

L. D. RICKETTS is at Santa Barbara, California.

C. F. TOLMAN, JR., has been at Grass Valley, California.

THOMAS NEILSON is on his way to the Philippine Islands.

W. DEL. BENEDICT has returned to New York from San Francisco.

PHIL LAUZON has joined the 164th Depot Brigade, and is at Camp Funston, Kansas.

J. S. HARRIS has joined the 164th Depot Brigade, and is at Camp Funston, Kansas.

HARVEY D. MILLER has joined the 164th Depot Brigade, and is at Camp Funston, Kansas.

RICHARD ROELOFS has resigned as manager for the Cresson Consolidated Gold M. & M. Company.

K. IKEDA, chief metallurgist for Fujita & Co., passed through San Francisco on his arrival from Japan.

GEORGE BRONSON REA, of the 'Far Eastern Review', is in San Francisco and is likely to open an office here.

E. L. HERMANN has become assistant superintendent of the Hancock Consolidated M. Co., at Hancock, Michigan.

MYRON L. FULLER has completed a summer's fieldwork in West Virginia for the Associated Geological Engineers.

W. G. HALDANE has resigned from the Colorado School of Mines to accept a position as superintendent of a potash plant in Nebraska.

P. K. LUCKE has resigned as consulting engineer for the Cia. de Minerales y Metales in Mexico, and has opened an office at San Antonio, Texas.

CHARLES S. HERZIG was married on October 13 in San Francisco to Miss Florence F. Upmeyer of Minneapolis. Mr. Herzig and his bride have gone to Salt Lake City.

ERLE P. DUDLEY, Captain at the Engineers Training Camp, Vancouver, Washington, has been relieved from duty and been assigned to the 20th Regiment, U. S. Engineers, at Washington, D. C.

COURTLAND E. PALMER, for a number of years one of the most active operating and consulting engineers in this country, died at his summer home in Arlington, Vermont, September 21. Mr. Palmer was born in New York in 1857. He was educated at Loyola College, Baltimore, at the Johns Hopkins University, and subsequently graduated from Columbia School of Mines, in 1878. Starting in the engineers corps of the Pennsylvania company of Pittsburgh in 1879, he later became assistant engineer of the New York Board of Health. In 1884 he removed to Colorado where he filled many important positions. He operated well-known properties at Aspen, Rico, Cripple Creek, and other districts in Colorado. He was general manager and vice-president of the Mollie Gibson Con. M. & M. Co. at Aspen, Colorado, during the time this property made its famous production. In 1903 he was appointed general superintendent of mines of the Guggenheim Exploration Co., and of the American Smelters Securities Co., and later became consulting engineer of the American Smelters Securities Co., which post he filled for several years. In 1910 Mr. Palmer retired from general professional work and devoted his energy to the mining interests in which he was personally concerned. He left a wide circle of friends who recognized his accuracy in details, his sterling integrity, and soundness of judgment.

## Recent Decisions

### CLAIM LINES DEFINED—EXTRALATERAL RIGHT

A mining contract required the conveyance by the Quilp company of "all orebodies of every description lying east of the west line of the Quilp claim extended down vertically and lying south of the north end-line of the Quilp mining claim extended down vertically and which may apex within the lines of the Surprise lode mining claim." See Diagram. The Surprise vein extended diagonally south-easterly on the dip beneath the Quilp claim.

Held, the north end-line of the Quilp claim, as referred to in the contract is the line *CD* (the Surprise claim being senior

in location). The west line of the Quilp claim as used in the contract refers to the line *FABC*. No rule exists in mining law against broken side-lines. The end-lines alone must be parallel. It follows that the Quilp company must convey all orebodies apexing in the Surprise claim and extending easterly of the west side-line of the Quilp and south of the north end-line as defined above.

Quilp Gold Mining Co. v. Republic Mines Corporation  
(Washington), 165 Pacific, 57. May 19, 1917.

### REVIEW OF THE ALICE CASE

Sale to the Anaconda Copper Mining Co. of Montana of the Alice Gold & Silver Mining Co. of the same State was upheld on October 1, 1917, by the U. S. Circuit Court of Appeals. The decision sustained by the U. S. District Court of Montana, upon an appeal made by the minority of the stockholders of the Alice Gold & Silver Mining Co. The property of the Alice Gold & Silver Mining Co. consists of the Alice, Magna Charta, Curry, Valdemere, Rooney, Hawkeye, Reef Fraction, Magnolia, Plover, Sankie West, Rising Star, Cotton Wood, Boston, Wood Yard-Gusset, Walkerville, Midnight, Roy Walker, Blue Wing, and Neptune lode claims, three-fourths interest in the Sankie East and Paymaster claims, the Alice mill-site, and a great many lots. This property is in the northern part of the Butte mining district. After the Anaconda company originally had made the purchase of the Alice Gold & Silver Mining Co., suit was brought by Peter Gedes, Joseph R. Walker, and other minority stockholders to have the same annulled and a new sale ordered. After a hearing Federal Judge George M. Bourquin gave his decision, in which he said: "It is apparent that both parties contemplate that in the event of no greater bid than the upset price, it shall be not optional but obligatory upon the Anaconda to pay Alice stockholders entitled thereto, in money.

The Court does not attempt to define who is entitled to the benefit of these proceedings. Of course, when a fund comes into the hands of a Court from corporate liquidation all stockholders share therein and are properly noticed to appear, but here is no such case. Here, if no sale is made, all stockholders are not entitled to be paid in money, but only those who did not consent to or acquiesce in the sale, or who are not otherwise estopped. It is their duty to come in, to, in effect, take a place as litigants, and surely not the Court's to seek them out and solicit them to do so. The suit is pending nearly four years, ample time for any of them to appear. At the same time, in view of the nature of the suit, the special relief sought, and the perhaps unforeseen determination, it is believed a limited time should still be allowed for any stockholder entitled to appear and prove his right to share in the relief granted."

When the first sale was made the stock named in the price was the old stock of the Anaconda. The present stock represents twice the par value of the old stock. Under the terms of Judge Bourquin's order directing a resale of the Alice Gold & Silver Mining Co., there being no bidder at a special sale before John Lindsay, November 10, 1915, the property reverted to the original purchaser, the Anaconda company. The consideration given by the Anaconda for the property was 30,000 shares of Anaconda stock, the value of which was placed at \$1,500,000 by the Court, and the assumption of the debts of the Alice company, amounting to about \$40,000. The lowest price which could have been accepted by the master under the Court's decree was \$1,904,391.07, had there been any bidders. Previous to the sale the Anaconda company placed in the hands of the master a certified check on the Daly bank, of Butte, Montana, for \$190,439.11, the 10% of the lowest price allowed, and which was required as a condition precedent to any bid being made or received. No other deposit was made. When 'no sale' was announced, the check was returned to John Gillie, general manager for the Anaconda company.

### EXTRA-LATERAL RIGHT—BURDEN OF PROOF

The presumption is against the validity of the extra-lateral claims of plaintiff to orebodies underlying the surface boundaries of another claim until he proves by a preponderance of evidence the continuity of his vein and the identity of said orebodies as part of that vein. Not only are the defendants *prima facie* entitled to all ore beneath the surface of their claims, but, as a working hypothesis, it is fair to assume, in the absence of a contrary showing, that the vein or veins there found will continue to extend upward at the same angle as exhibited below. In any event, ore presumptively belonging to the defendants, because beneath the surface of their claims, cannot be taken from them on the mere opinion of witnesses for plaintiff that the ore has its apex in the plaintiff's claim. The presumption in favor of the overlying surface owners "is not overturned by speculative conjecture or intelligent guess." Plaintiff's failure to furnish substantial evidence of the identity of the vein by working down from their apex to the disputed territory held fatal.

Barker v. Condon (Montana), 165 Pacific, 909. May 28, 1917.

### COAL LANDS—SURFACE SUPPORT

The owner of coal lands conveyed the surface, reserving the right to remove the coal without liability for damage to the surface. Subsequently he conveyed the coal in place without expressly granting the right to remove it without liability for surface-support. Held, that the grantee of the coal was liable for the support of the surface.

Penman v. Jones (Pennsylvania), 100 Atlantic, 1043.

# THE METAL MARKET

## METAL PRICES

San Francisco, October 16.

Aluminum-dust (100-lb. lots), per pound.....	\$1.00
Aluminum-dust (ton lots), per pound.....	\$0.95
Antimony, cents per pound.....	16.00
Antimony (wholesale), cents per pound.....	14.75
Electrolytic copper, cents per pound.....	23.50
Pig-lead, cents per pound.....	7.25—8.25
Platinum, soft and hard metal, respectively, per ounce.....	\$105—111
Quicksilver, per flask of 75 lb.....	100
Spelter, cents per pound.....	10
Tin, cents per pound.....	60
Zinc-dust, cents per pound.....	20

## ORE PRICES

San Francisco, October 16.

Antimony, 45% metal, per unit.....	\$1.10
Chrome, 34 to 40%, free SiO <sub>2</sub> , limit 8%, f.o.b. California, per unit, according to grade.....	\$0.50—0.60
Chrome, 40% and over.....	\$0.60—0.75
Magnetite, crude, per ton.....	\$8.00—10.00
Manganese: The Eastern manganese market continues fairly strong with \$1 per unit Mn quoted on the basis of 48% material.....	26.00
Tungsten, 60% WO <sub>3</sub> , per unit.....	\$40.00—45.00
Molybdenite, per unit MoS <sub>2</sub> .....	

## EASTERN METAL MARKET

(By wire from New York)

October 16.—Copper is unchanged and nominal at 23.50c. all week. Lead is easy and lower at 7.80 to 7c. Zinc is dull and easier at 8.50c. all week. Platinum remains unchanged at \$105 for soft metal and \$111 for hard.

June ....	5.75	6.88	11.74	Dec. ....	5.34	7.55	

Lead started the year in New York at a price a little over 7.5c. per lb., but immediately began to rise, reaching 10.5c. late in February and early in March. A decline carried the price down to 9.25c. early in April, but this was followed by a rise reaching 12.25c. in the middle of June. The first half of the year closed with lead at 11.25c. The average price of lead for the period was 9.9 cents.

At the average New York price the value of the lead produced from domestic ores the first half of 1917 was \$54,751,000, and the value of that produced from foreign ores was \$5,849,000, a total of \$60,600,000, as compared with a total value for the year of \$78,816,000 in 1916 and of \$51,705,000 in 1915.

One result of the increasing imports of foreign lead is that a larger quantity of foreign lead is 'in stocks in bonded warehouse,' of which there was 19,517 tons on June 30, as compared with 12,369 tons at the close of 1916. Other stocks of lead are comprised in the ore that has necessarily been gathered preparatory to smelting at the new Kellogg smelter of the Bunker Hill & Sullivan Mining Co. and at the Deming plant of the Empire Smelting & Refining Co. The increasingly high price of silver and the high price of lead have greatly stimulated prospecting in the Western States and have led to the opening of new deposits and to the re-opening of silver-lead mines that were abandoned on account of the low price of silver. Though not adding to the sum total of domestic lead supply, the decreased use of lead pigments owing to their high cost leaves that much more of the domestic supply available for use as metal. The annual report of the largest producer of white lead says that the quantity sold in 1916 was the smallest for many years.

## ZINC

Zinc is quoted as spelter, standard Western brands, New York delivery, in cents per pound.

Date	Average week ending
Oct. 10.....	8.50
" 11.....	8.50
" 12 Holiday.....

" 16.....	8.50

## Monthly Averages

	1915	1916	1917		1915	1916	1917
Jan. ....	6.30	18.21	9.77	July ....	20.54	9.90	8.98
Feb. ....	9.05	19.99	10.45	Aug. ....	14.17	9.03	8.58
Mch. ....	8.40	18.40	10.78	Sept. ....	14.14	9.18	8.33
Apr. ....	9.78	18.62	10.20	Oct. ....	14.05	9.92	
May ....	17.03	16.01	9.41	Nov. ....	17.20	11.81	
June ....	22.20	12.85	9.63	Dec. ....	16.75	11.26	

The price of spelter at St. Louis started at 9.75c. per lb. and after receding to 9c. at the middle of January it rose gradually to 10.75c. early in March. The price dropped to 8.9c. late in April, rose gradually to 9.4c. by the end of May, and closed the period at 9c. even. The average price of a pound of spelter at St. Louis for the first six months of 1917 was 9.8c. The foregoing prices are those of the ordinary commercial grades of spelter. High-grade spelter suitable for cartridge spinning has been in so great demand that it has brought a good premium. At the average price for immediate delivery at St. Louis the value of the spelter produced from domestic ores during the six months, if reckoned as prime Western grade, was \$61,062,000 and that of the spelter produced from foreign ores was \$9,721,000, a total of \$70,783,000. Most spelter is sold for future delivery, and in the preceding years of the War the average price has been considerably lower than the average spot quotations. For the first six months of 1917, however, spelter for future delivery has brought within a half cent of spot spelter and in May and June commanded a small premium over spot spelter. Taking into consideration the high grade of the spelter sold, the average selling price of spelter must have been above the average quotation for spot spelter, and the total value indicated above must be somewhat under the real figures.

## QUICKSILVER

The primary market for quicksilver is San Francisco, California being the largest producer. The price is fixed in the open market, according to quantity. Prices, in dollars per flask of 75 pounds:

Date	Week ending

# Eastern Metal Market

New York, October 10.

The metal situation as a whole has not shown any life during the past week and all the markets are dull and weaker with the exception of tin. Uncertainties continue the dominant factor. What appears to be a settled matter today is reversed tomorrow and there is no stabilizing influence nor any basis for settled business.

Copper is chaotic and nominal.

Tin is more active and higher.

Lead is dull and weaker.

Zinc is again stagnant and nominally lower.

Antimony is quiet and unchanged.

Aluminum is inactive and lower.

New buying of steel is negligible still. The entire trade is awaiting the announcement of agreed prices on at least a hundred different steel products, and this may come this week. In the meantime prices continue to fall, 1000 tons of billets having been sold at \$55 for October delivery, a decline of \$5 per ton.

## COPPER

The copper situation has been decidedly chaotic and still is somewhat so. The principal cause of this has been the virtual commandeering by the Government of all supplies of copper. This has been brought about by the fact that producers have not only been told not to sell at even the Government price of 23.50c. per lb., but also not to deliver any metal already contracted for. The object of this has been to conserve supplies until it shall have been determined how much copper will be needed by the Government and its Allies. It is now stated that delivery on contract may proceed since it is found that supplies over and above these needs appear reasonably ample. The report states that the requirements of the Government and its Allies will call for 120,000,000 lb. per month for the last quarter, or 360,000,000 lb. to January 1, 1918. While production in August and September was low, or an average of only 140,000,000 lb. for each month, against an average of 185,000,000 lb. per month for April and May, the estimated output for the last quarter is 200,000,000 lb. per month, leaving at least 80,000,000 lb. per month for domestic consumers, which is regarded as sufficient. A 'pooling committee' of producers, which has been holding daily meetings in New York recently, has arranged to meet a similar committee of consumers, and it is expected that the statistical data that will result from this meeting, and the better understanding of the entire situation as to supplies, and the requirements of the trade, will act as a stabilizing influence and clear the atmosphere. Business has been at a standstill. Small lots to needy consumers have gone at 26 to 28c. per lb. and higher, and in no case has lower than 26c. per lb. been quoted for first quarter metal. The London market is unchanged at £125 for spot electrolytic, and £121 for futures.

## TIN

The tin market is the only one which has exhibited any life in the last week so far as sales are concerned. It has been fairly active until yesterday and Monday when actual buying eased off though inquiry was fairly good on Monday. Last week, on October 3, an inquiry for 125 tons appeared from one consumer but no sale is known to have resulted. Another consumer reported that he had bought 200 tons for prompt and nearby shipment, although apparently there were no sellers at that time. The situation was a mixed one, with leading sellers all reporting the situation dull. On October 4, however, sales of 300 tons by one or two sellers were reported, all

for future delivery. Again, on October 5, there was a fair business in futures, with transactions totalling about 200 tons, also futures. Today the market is quiet and dull. The feature of the week since our last letter has been a distinct tightening in the present situation, especially as regards shipments from England and the Straits settlements. This may mean a hardship later for buyers of spot-metal, because the names of persons to whom the tin is to go is now required. Yesterday the quotation was 61c., New York, the Monday price having been 61.12½ cents.

## LEAD

There has been only one bright spot in a very dull lead-market, which has been stagnant and uninteresting since our last report; this has been a demand of considerable proportions from England and Canada. Outside of this the demand has been as light as it is possible for it to be, with buyers holding off. Sellers are desirous of orders and have made concessions. Sales for November delivery have been reported as low as 7.50c., New York, with bids for December delivery at 7.37½c. The New York quotation yesterday had fallen to 7.80c. or 7.65c., St. Louis, but little business even at this figure was reported. It is evident that some consumers are expecting a lower price than 8c. to be fixed by the Government and a reduction of the American Smelting & Refining Co.'s quotation of 8c. would not be a surprise. It is an unconfirmed report that producers have agreed to furnish the Government October metal at less than the contract price of 8c. per lb. if the published quotations should show an average of less than 8c. for that month. This has had an unsettling influence.

## ZINC

The market is exceedingly depressed. Filled with hope that the bottom had been reached two or three weeks ago, the market rose to 8.50c., New York, and a fair buying move was started, and it was not then expected that zinc would again fall to the 8c. level or lower; but today zinc is decidedly weaker. The quotation, regarded as nominal by some large producers, is now 8c., St. Louis, or 8.12c., New York, for prompt and October delivery, but demand is absolutely lacking. For delivery in November and December about 8.12c., St. Louis, or 8.37c., New York, is asked, but sales for this position are inconsequential. It is stated, but we have been unable to confirm it, that metal as low as 7.75c. has been offered by one producer. Today this offer is said to have been withdrawn.

## ANTIMONY

There is no market. Demand is at a standstill. Chinese and Japanese grades are obtainable at 15c. per lb., New York, duty paid.

## ALUMINUM

No. 1 virgin metal, 98 to 99% pure, is quoted at 40 to 42c. per lb., New York, but the market is inactive.

## ORES

Tungsten: Quotations for the various grades of tungsten ore are unchanged, and quite a little business is reported as having been done at \$23 to \$26 per unit for 60% concentrate. European inquiry has appeared. For ferro-tungsten \$2.35 per lb. of contained tungsten was recently bid on an inquiry, but was not accepted. Quotations range from \$2.30 to \$2.50 per pound.

Molybdenum and antimony: Molybdenum is held at \$2.20 per lb. of MoS<sub>2</sub> in 90% concentrate, with \$2.15 asked for the 85% grade, and a small volume of business is reported. There is nothing to report in antimony but quotations are unchanged.

# INDUSTRIAL PROGRESS

## BALL-MILL SPEED

By V. A. STOUT

There seems to be considerable guessing in regard to the proper speed at which to operate a ball-mill under certain conditions of feed and discharge. With the present popularity of ball-mills for grinding the question of the proper speed to obtain the best results is of vital importance. It is the purpose of this article to suggest and give illustrations as to the best speeds for one type of ball-mill, the Hardinge. I think that all ball-mills in their actual operation differ so little as to make the following information of value to operators of any kind of ball-mill.

There would seem to be four conditions involved that are so distinct as to call for entirely different methods of operation. (1) There is the ball-mill used as a primary grinder ahead of some other type of re-grinding machine which may be employed to finish comminution for concentration by gravity tables, flotation, or cyanidation. Usually this involves a feed having a diameter of two to three inches and a resultant product from four to twelve-mesh size. In this group may be included ball-mill grinding to 20 mesh for metallurgical treatment without further re-grinding. (2) There is the operation of the ball-mill, usually grinding in closed circuit with a classifier, so that the overflow from the classifier is a finished product, the oversize going back to the same mill for further grinding. This usually involves a minus 2 in. to 3 in. feed, and the finished product may be 48, 65, 80, or 100 mesh, and in some instances it may be as fine as 150 to 200 mesh, depending on the point where practice shows the economical grinding limit to lie. (3) Another condition is a recent development since imported pebbles have become scarce and expensive. This is really within the field of the pebble-mill. The feed may be a jig-tailing or primary-grinder product ranging from 8 mesh to  $\frac{1}{2}$  in., with a finished product under 16 or 20 mesh, the object being to reach this size with the production of the least possible slime, and to further treat it on 'rougher' gravity-concentration machines with perhaps the subsequent separation of sand and slime for additional treatment. (4) The last condition is that in which the feed to the ball-mill is the product of a primary ball-mill grinding to 4 up to 10 mesh or of material from rolls and other primary crushers delivering  $\frac{1}{2}$  in. to 8-mesh material which may or may not be jig or 'rougher'-table tailing. This feed is ground to 48, 65, 80, 100 mesh, or finer. It is not necessary to discuss the relative merits of these various uses for ball-mills. It is enough to say that ball-mills are being used under all these conditions, and therefore the question of a critical speed becomes important and vital.

Taking the first condition where the ball-mill receives a feed varying from 2 in. to 3 in. and delivers a coarse product in one passage through the mill for further grinding or not as the metallurgical requirements of the ore may demand, the best peripheral speed is shown to be from 500 to 575 ft. per minute. In the case of an 8-ft. diameter Hardinge ball-mill at the Dome Mines Co., Porcupine, Canada, 23 r.p.m., or 575 ft. per minute, proved best. Here the product was to be re-ground in tube-mills to 150 mesh for cyanidation. Conse-

quently 150-mesh material in the product of the ball-mill was to be looked on with favor since the tube-mills were relieved of just that much work. This would not apply where the avoidance of fine material with a consequent increase in colloidal slime is desirable in order to increase the extraction of the precious or semi-precious metals. Such a case would be the stage-reduction of a gold-bearing sulphide ore for amalgamation and gravity concentration. Such a condition as this is found at the plant of the Treasure Mining Co., Amador City, California. Here a 4½-ft. ball-mill gave the best results when operated at 33 r.p.m., or 466 ft. peripheral speed. In the case of the Cerise Gold Mining Co., at Wilbur Springs, California, a 6-ft. ball-mill delivers 20-mesh material with one passage through the mill for amalgamation and concentration.

Group two involves grinding from minus 2 to 3 in. to a fine mesh in closed circuit with a classifier. It would seem with this condition that 475 ft. per min. is the best peripheral speed. This was conclusively proved by a series of exhaustive tests. An 8-ft. diameter ball-mill was run long enough at each speed, from 27 r.p.m. down to 15 r.p.m., to show what the mill was doing. Elaborate time-tonnage samples of feed and discharge were taken and a curve based on efficiency measured in mesh-tons per horse-power was plotted. This curve showed a gradual increase in efficiency as the speed was decreased down to 19 r.p.m. After this point was reached there was a gradual falling off in efficiency as the speed of the mill was further reduced. Of the examples given only the 6-ft. ball-mill at the plant of the Weringer Mines Co., at Woody, California, was greater than this speed. In this case a chalcopyrite disseminated through granite, crushed to 3 in., was fed to the mill. The finished product was 65 mesh and the subsequent metallurgical treatment was flotation. At the Calaveras Copper Co. and the Pacific Mines Corp., the product desired is finer than 65 mesh, being in the former plant 90% of 80 mesh and in the other 150 mesh, with 96% as fine as 200 mesh. The Nevada Austin Mines Co., at Austin, Nevada, desires a fine product, namely 80 mesh with 90% through a 100-mesh screen. The conclusion would be, therefore, that the finer the product desired under the conditions given, the slower should be the speed of the mill, within certain limits.

Group three does not seem so well exemplified. This is due, probably, to the fact that a great number of pebble-mills are still being used in this class of work. It is generally recognized that ball-mills slime more than pebble-mills, and since slime is to be avoided in this class of grinding, only a few examples are available. The Britannia M. & S. Co. used a 6-ft. ball-mill to grind from  $\frac{3}{4}$  in. to 20 mesh, with considerable success. The slime was not excessive and the tonnage was excellent. The Treasure Mining Co. takes a 4-mesh feed and grinds to 24 mesh for amalgamation and gravity concentration. It may be stated that while the results attained are satisfactory no experiments looking toward improvement by varying the speed have been made. Coming to the last group, which includes grinding from about  $\frac{3}{4}$  in. to 48, 65, 80, or finer mesh one must look to the Anaconda Copper Co. as having paved the way for the slow speed of ball-mills in this class of grinding. A report concerning this change is as follows: "In regard to the Hardinge mills, we certainly are operating them at slow speed, and have changed practically all of our

mills to slow speed now. We have tried operating them at speeds from 23 r.p.m. down to 15 r.p.m., and we have found that 15 r.p.m. is by far the best. This is one of the biggest improvements that we have made for some time, that is, the slowing down of the mills. In using the slow-speed mills, we are doing the same work that we did with the high-speed mills, with the consumption of  $\frac{1}{2}$  hp. per ton as against the consumption of 1 hp. per ton with the high-speed mills; also we have reduced the ball-consumption from 5 to  $5\frac{1}{2}$  lb. of manganoid per ton in the case of the high-speed mills, down to  $3\frac{1}{2}$  lb. per ton for the slow-speed mills."

One glaring exception appears in the case of the Nevada Consolidated Copper Co., at McGill, Nevada. The explanation can lie in but one direction. In the case of the slow-running mills the pulp-dilution is from 40 to 50% solid. In the case of the Nevada Con. the pulp-dilution is 72% solid, being so thick that it resembles mud. From this it would appear that the same result can be obtained by running the mill slowly or by using a very thick pulp. This is further substantiated by results obtained by the Miami Copper Co., at Miami, Arizona. Their 8-ft. ball-mill, taking a minus 2-mesh feed and grinding to 48 mesh, does excellent work at 512 ft. per minute, but the pulp holds 68% moisture. It has been proved that the slower the speed of the mill, other conditions being equal, the less the power consumption. It is also axiomatic that the thicker the pulp the lower the consumption of balls and lining. It would appear, therefore, that to get the best results from a ball-mill the speed should be consistent with the work to be performed and the moisture-content of the pulp should be as low as possible, but regulated to a considerable extent by the fineness of the finished product.

For primary grinding, then, reducing from 3 in. to 20 mesh, I would recommend about 550 ft. per minute as the best peripheral speed. For grinding with this coarse feed to a fine finished product 475 ft. per minute would seem to be the best speed. Finally, for fine grinding in a ball-mill, with a 2-mesh to 12-mesh feed, 375 ft. per minute is the best speed. In all cases the moisture-content in the ore should not exceed 50% by weight, but in the case of too high a peripheral speed a thick pulp has the effect of slowing down the action of the balls so that equally good results are attainable.

## THE BRINELL METER

The construction of the portable 'Brinell Meter', a patented invention of F. H. Schoenfuß, Director of the Metallurgical Laboratory, Standard Roller Bearing Co., is based on the principle of action and reaction.

A steel ball of 10 mm. diameter is placed between two surfaces of metal, one of known Brinell hardness, and the other of unknown hardness, being the material under investigation. Any pressure exerted against the assemblage of the three presses the ball with the same force into the surface of the plate of known hardness as into the plate of unknown hardness, and the size of the indentations obtained are in direct proportion to the Brinell hardness of the two metals.

Direct-reading tables are furnished with the outfit showing 'Brinell Hardness Units' for the material under test, depending on the ratio of the indentations produced (by means of a hammer blow); measuring scales for determining the diameter of the dents also form a part of the equipment.

The Brinell test for determining the hardness of metal has been officially accepted as the standard method by the American Society for Testing Materials, the Society of Automobile Engineers, and is used and recommended by the U. S. Bureau of Standards.

The cost of Brinell tests has been considerably reduced through the development of the portable Brinell meter. While formerly it was necessary to cut and prepare a specimen for

test in the Brinell machine, an operation quite expensive in time and labor, it is now possible to eliminate the loss of time and to make 100 Brinell tests against every hardness standard as furnished with the Brinell meter. These standard bars are six inches long and have four surfaces to work on. Six of these bars are supplied with the standard outfit, and additional bars are furnished at 50c. each, within the range from 150 to 700 Brinell, and at 75c. each, within the range from 40 to 150 Brinell. Thus, the cost of every Brinell test is now reduced to a fraction of a cent, and considerable saving in time is afforded, as no specimens of the material under test have to be cut.

If metal is purchased under specification of a certain hardness, the standard bars for use in the instrument can be supplied of that specified hardness. The deliveries can then be rapidly checked, as the dents in the material tested and in the standard must be of exactly the same size, if the metal comes up to specifications.

The Brinell hardness of metals and alloys is in direct relation to their tensile strength, so that the portable Brinell meter can also be used as portable tensile-strength tester.

The relation between Brinell hardness and tensile strength is a direct one, but the 'constant' is different for the various metals and alloys. It has been accurately determined for straight carbon steel (up to 1% carbon), so that the constants published below are of considerable value in determining the tensile strength of structural steel, for instance:

A. For hardness numbers below No. 175 Brinell.

Constant = 514.87 for indentations transversal to rolling direction.

Constant = 503.49 for indentations in the rolling direction.

B. For hardness numbers above No. 175 Brinell.

Constant = 489.27 for indentations transversal to rolling direction.

Constant = 460.82 for indentations in the rolling direction.

Example: Brinell hardness determined on a steel beam transversal to rolling direction = No. 185. Tensile strength =  $185 \times 488.27 = 90,515$  pounds.

This makes the Brinell meter a handy, portable, tensile-strength tester, especially valuable to mechanical and structural engineers, permitting rapid tensile strength determinations on vertical and horizontal steel structures.

The following are the advantages of the portable Brinell meter:

It permits the accurate and convenient determination of the Brinell hardness of metals and metal products, independent of their dimensions, shape, and location. Accurate Brinell hardness tests can be made by means of this instrument at any chosen spot of a large mass of metal, such as a casting, rail, ingot, car-wheel, steel beam, metal tube, armor plate, shell, or gun barrel. No cutting of specimens is required. Whenever specimens of material are tested, it is very uncertain whether they represent the true average hardness value of the entire mass of metal under test. The Brinell meter eliminates the sampling error, as it permits accurate Brinell tests at any chosen spot; a series of Brinell tests on a large piece of metal can thus be quickly made and the average hardness and uniformity of the material may be ascertained. The Brinell determinations carried out by means of the portable Brinell meter are equally accurate in tests in horizontal and vertical position, of thick and thin metal sections, of hard and soft metals. The Brinell meter is portable. Total carrying weight of complete outfit,  $6\frac{1}{2}$  lb. Dimensions of carrying case, 9 by 6 inches.

Although the portable Brinell meter does more than the old-style Brinell testing machines, its price is \$55 only, so that the most accurate method of hardness determination is brought within the reach of the smallest shop.

# G-E Complete Electrical Equipment for Cranes Assures Speed with Safety

G-E engineers have studied crane requirements and designed electrical apparatus to meet known operating conditions. Every requirement for stopping or starting, and the entire operating cycle is fully met by specially designed apparatus.

## Motors

Interpole motors, capable of standing heavy overloads, are manufactured in any speed or horsepower needed. These motors have split frames and large handholes for accessibility, and can be disassembled without disturbing back gearing.

## Brakes

G-E crane motors are furnished with automatic solenoid brakes which work without jar or shock and make automatic compensation for brake shoe wear. Brake shoes made of metallized asbestos compound give a high co-efficient of friction with but little wear.

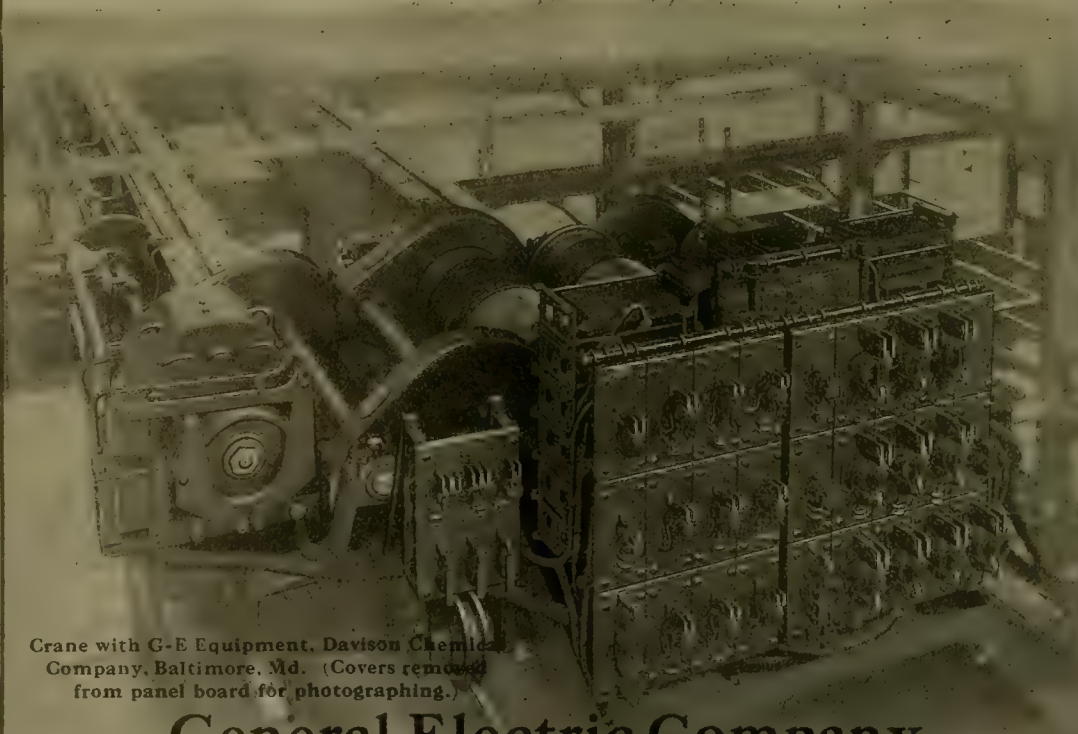

## Resistors and Protective Panels

The G-E standard for crane equipment is to supply all resistor sections of uniform size, which reduces the number of spare parts needed to a minimum. The design of the cast iron grid resistance units is such as to avoid the danger of short circuits by vibration and double insulation protection against grounding is provided. Protective devices are furnished in small panel units which can be attached in any convenient place. A push knob on master panel opens line in an emergency, and overload protection is afforded at all times.

## Controllers

Horizontal or vertical handle controllers are furnished which are absolutely reliable and very accessible. They are equipped with magnetic blow-outs, arc chute protecting covers, and many refinements which twenty years of controller building suggested.

Your inquiry for complete electrical crane equipment is solicited.

Crane with G-E Equipment, Davison Chemical Company, Baltimore, Md. (Covers removed from panel board for photographing.)

**A**MONG the appeals to the mining public is a post-card issued by the Idaho Mining Association, calling upon those engaged in mining to show their patriotism by investing (in the purchase of Liberty Bonds) the amount saved through the enactment of the law exempting mining claims from assessment work during the current year and in 1918. That is a good argument. Gentlemen of the pick, it is up to us! Let us help to forge the sword that shall thrust the blond beast back into his lair.

**U**TAH COPPER is feeling the effects of war conditions and some not unnatural anxiety has been shown among its thousands of shareholders. The excess-profits tax is estimated to call for a contribution of \$2,250,000, but the company is reported to have \$15,000,000 worth of copper on hand in process of treatment, besides \$19,000,000 in cash, so that even a large contribution to the National exchequer will not break its back. The big mining enterprises of the country are proving real pillars of strength not only in furnishing the metals requisite for munitions but as sources of revenue. We believe that the big-scale men in control of them will make no effort to evade their responsibilities, but, on the contrary, that they will respond to their duty with a proud heart.

**S**UBSCRIPTIONS to the Liberty Loan are being made at an accelerating rate as the time shortens. Our readers will have received various appeals to do their share. Many are the slogans sounded to stimulate patriotic participation. One of the best is that suggested by the Governor of California: "Go across with guns or come across with funds." Those of us that cannot perform the supreme duty of manhood can at least do the smaller service, loaning our money for the national purpose. We do not give the money, we simply exchange it for gilt-edged bonds at 4%, the safest and best investment, in a financial sense, that is available to the thrifty and loyal citizen. The President has set aside next Sunday as a day of prayer for the success of American arms in the War, in accordance with a resolution of Congress. Let us pray for the success of our great campaign, which is no chivalrous adventure but a vital effort to save our country from brutal aggression and organized piracy.

Let us pray, but let us also give the outward and visible sign of fervor by furnishing the money urgently needed to complete the great task undertaken by our forces on land and sea.

**M**EXICO, according to an agreement made between Señor Ignacio Bonillas, the Mexican ambassador at Washington, and the United States Treasury department, has promised to remove the restrictions on the export of metals whereby a counter-importation of an equal amount of gold for all gold bullion exported was required and 25% on all the silver imported. In return, any money due on the balance of trade will be paid in gold. Under this agreement Mexico will receive \$8,000,000 in gold during October, \$5,000,000 in November, and \$2,000,000 in each month thereafter, with a distinct understanding that Mexico must not ship the gold to other countries. Apart from facilitating the business of mining companies, the arrangement appears to be in the line of consummation of the plans to aid Mexican finance and thereby hasten the restoration of order.

**P**REFERENTIAL flotation is the subject of an illuminating article by Mr. W. Shellshear, printed in this issue. It has the particular merit of dealing with actual practice, and it represents the fruits of long experience by a devotee of the art. Mr. Shellshear is interested in the theoretical aspects of the problem, and he offers pertinent suggestions concerning the recondite causes for some of the effects observed in practical work, but he contents himself mainly with presenting the facts that have been learned empirically. His discussion of the details of the application of sulphur di-oxide as an agent for preferential flotation is the most exhaustive of any that has hitherto been published. It is interesting to be reminded that, when floating galena with the aid of sulphur di-oxide, no oil or organic substance is required, and he calls attention to the importance of sodium carbonate as a frothing-agent. Of special significance in connection with the possibilities of discarding oil and soluble organic material is his statement that the function of the frothing-agents is to intensify the physical conditions that promote flotation rather than to produce them. This serves to accentuate the need of a more thorough investigation of the physical principles

upon which the process depends. The nearer we approach to an understanding of these fundamental conditions the closer will we come to emancipation of the flotation method from the impositions that now hamper the mineral industry.

THE supply of sulphuric acid has been taken under consideration by the Food Commission, and Mr. Charles W. Merrill has been placed in charge of the investigation. The United States Geological Survey has recently completed an examination of the sulphur resources of Louisiana and west Texas, and we understand that a pyrite survey will follow. No lack of raw material exists, and a competent organization, such as will now be effected, should render it available for the acid-makers. In case of extreme need the fume now going to waste at many smelters in the West could be utilized, but that entails further difficulties in obtaining the necessary tank-cars, and would throw new burdens upon the over-taxed railway systems of the country. It would be more simple and expeditious to draw upon the developed resources of pyritic ores in the mining districts of the Western States than to erect new acid-works and prepare for transporting the acid. Large tonnages of these ores can be had on short notice. Meanwhile, the abundant outcrops in the famous pyrite belt of Virginia should be promptly developed. Orebodies have been opened at intervals from the James river northward to the Potomac, and the indications point to enormous undeveloped resources. The proximity of this zone to the centres of sulphuric-acid manufacture gives it great importance at this time. The pyrite from Virginia contains about 3% of zinc and some copper. On this account it is of peculiar value for mixing with zinc-blende concentrate, whereby it can be cheaply roasted, primarily for acid-making, leaving a cinder from which the zinc is leached for use in the manufacture of lithophone. Many of the pyritic copper ores now penalized by smelters on account of the large zinc-content might also be utilized for acid-making, afterward extracting the metals from the cinder by leaching methods. These possibilities will not be overlooked by the committee over which Mr. Merrill will preside.

## Russia

Mr. Horace V. Winchell contributes a timely article to this issue on 'Russia in War-Time.' We are all vitally interested in the fate of that huge country, for our own prospects of an early solution of the difficulties confronting us depend upon an unshaken Russian defensive. Mr. Winchell brings first-hand news of supreme importance to every American, for he can be relied upon as a competent and trustworthy observer. The picture which he presents is that of a country at the mercy of a rabble, for the most part good-natured and not given to malicious excesses. The central authority is unable to bridle the wild multitudes bent on enjoyment of liberty in the spirit of a debauch. The tendency

to graft permeates all classes, and offers the largest resistance to effective co-ordination of the nation's resources and strength. Nevertheless, one splendid fact stands forth pre-eminent above the seeming dissolution of civic organization. There is a national purpose in the hearts of the people, and that is to withstand the onslaughts of Germany. Were this not so, the efforts of Kerensky would have been in vain, and the troops of the Kaiser would now be swarming into the rich fields of middle and southern Russia. There is a genuinely effective Russian resistance, despite the ceaseless dispatches telling of anarchy. That circumstance alone is proof that the Russian leaders have found a rallying point for the people, and are in control not only in name but in fact. If Germany could penetrate the eastern front, and scatter the Russian forces guarding even 50 miles of the long frontier, the resources of the richest territory in Europe would be at her command, and the War might continue for a decade. Indeed, with Russia conquered, the world might be forced to compromise and to accept an inconclusive peace. It is evident that Kerensky is maintaining a firm defence, and that also means that he has succeeded in organizing the resources of the country so as to bring up the needed munitions and supplies for the army. In the face of this, the attack upon Riga loses much of its importance. Success in the north, at the threshold of winter, when the Frost Giants come to the aid of Russia, is an equivocal advantage, and time is thus afforded for putting the country in order and preparing to hold back the Teuton from Moscow and the South. If the health of Kerensky does not weaken under the terrible strain there is hope that he may accomplish his purpose, with such aid as America can lend in money and material.

## A Pro-American Policy

Adverse criticism of the Secretary of War and of other officials at Washington for allowing the obstructionist tactics of un-American advisers to frustrate the intent of Congress as expressed in the bill authorizing the construction of a great government nitrate plant, has borne good fruit. We hasten to congratulate Secretary Baker upon having overcome the obstacles that were placed in his path to obscure the facts and to induce a hesitant policy in order to fritter away time and opportunity as well as the funds appropriated. We confess to sympathy for every high official of the Administration at this time of battling interests. The War rages around them in subtle and confusing ways, the force of which an outsider can but dimly surmise; every conceivable device is employed to divert them from courses that would most benefit the Nation; and if the doubts cast before a departmental secretary achieve no more than to work delay, a gain has been scored by the agents of the Enemy. At last, however, decisive action has swept away the pernicious net of plausible scientific objections that had been woven about the nitrate project.

The 'Nitrate Division' of the Ordnance office has stated that the original restrictions requiring that the site selected should be "somewhere in south-west Virginia" has been removed, and that the plant will be erected at Muscle Shoals in Alabama if a site can be secured at a reasonable price. We may count upon the people of Alabama attending to that side of the matter, even if they have to purchase riparian rights from private owners and present the land to the Government. The boards of trade of the chief Alabaman cities have gone on record regarding that question. The interesting point that has appeared in connection with the recent announcement of the Ordnance office is that the entire appropriation of \$20,000,000 will be concentrated on the erection of an efficient plant as soon as the selection of a site at Muscle Shoals shall have been made. The original purpose of the Act will thus be conserved. The constituents who urged their congressmen to pass that bill were men who realized the dependence of this country upon Chile for the bulk of our fixed nitrogen, and they insisted, as a preparation against the emergency of war, that a substantial effort be made to eliminate this weakness from our military and economic situation, and they had no thought of delays in carrying the project into effect, nor of expending a large part of the sum appropriated in further technical experiments. The bill was meant to strengthen our defences immediately at a particularly vulnerable point. If processes were to be tested a special bill, carrying its separate appropriation, should have been introduced for the purpose. With our supply of nitrate for munitions and agriculture dependent on an easily assailable 7000-mile ocean highway, it is clear that our diplomacy must be tempered by recognition of that fact. The action of the War Department in this case is now in the direction that will help to stiffen the pro-American policy of the Government.

## The St. Louis Meeting

The recent convention of the American Institute of Mining Engineers at St. Louis was a success so great as to surprise even its sponsors and so complete as to stultify the small group of small men in south-eastern Missouri that withheld the support to have been expected from all loyal members of the organization. We leave the recalcitrants to their chagrin and hasten to congratulate the President, Mr. Philip N. Moore, also Mr. H. A. Buehler, the chairman of the local executive committee, Mr. Walter E. McCourt, the secretary of that committee, Mr. H. A. Wheeler, chairman of the excursions committee, and Mr. Victor Rakowsky, chairman of the Joplin-Miami committee. To these gentlemen and to their numerous aides the success of the meeting was due, backed by an attendance larger than any recorded previously outside the headquarters at New York. Space will not permit us to give a full account of the proceedings, so we shall dwell upon the outstanding feature of the convention, namely, the patriotic meeting held on

the afternoon of Monday, October 15. This was called to hear a report of the War Minerals Committee, but it developed into a forceful expression of loyal co-operation in the National effort by the Institute as a whole. Letters of regret were read from Sir Robert Hadfield, who referred to the passage of the American troops through London as "the greatest day in Anglo-Saxon history;" from Dr. L. D. Ricketts, mentioning his slowly recovering health as the only reason for being absent; from Mr. H. C. Hoover, who used his opportunity to make a plea for "saving, serving, and sacrifice." At the suggestion of the chairman, Mr. Moore, the audience honored the Food Administrator by standing during the reading of this letter. Thus early in the proceedings the audience showed itself keenly enthusiastic, and its enthusiasm was sustained throughout the session. Mr. Moore explained the objects of the meeting. Each speaker was introduced by him in felicitous terms, epigrammatic as those of a chancellor bestowing an honorary degree. Mr. H. M. Ami, the French-Canadian geologist, was present as a representative of the British legation at Washington. He spoke eloquently concerning the solidarity of the three great Allies, likening the French to the polished mica, the British to the gritty quartz, and the American to the interlocking feldspar that together composed the strong granite of our battle-front. He was followed by Colonel E. De Billy, the head of the French commission, an accomplished soldier, commanding a flow of scholarly English, which he used most effectively. He pointed at the fact that not armies but nations were in the field, along a line of trenches stretching for 750 kilometres and so continuous as to render out-flanking impossible. Whereas previous battles, such as those in Manchuria, during the Russo-Japanese war, ceased when supplies of ammunition were exhausted, in the present war the organization of industry has assured a steady supply that guarantees uninterrupted fighting. Service at the front has undergone specialization "as in a well-conducted factory." The democratic life in the trenches has developed a fellowship that will have enduring results in helping to settle political difficulties. Fully 80,000 enlisted men have received commissions in the French army. Colonel De Billy then referred to the rehabilitation of the coal mines in northern France and acknowledged the offer of assistance already made by American mining engineers. When he ended his speech, the chairman, Mr. Moore, called for three cheers for France. They were given with gusto. Next came Mr. Fedor F. Foss, a mining engineer representing the Russian Ministry of Commerce, now on a special mission to the United States. He dwelt upon the extraordinary difficulties of his country. When hostilities began the mining and metallurgical societies of Russia combined and offered their united services to the Ministry of War, in vain. The various departments of War, Navy, and Commerce were of the opinion that any concerted effort to develop the national industries would be too slow to count in the War; the results were deemed too remote;

so nothing was done, until the Galician retreat in 1915. By that time the authorities had shown themselves bankrupt of ideas and the People's War Industrial Committee had been organized all over Russia largely under the leadership of Alexander Goutchkoff, who became Minister of War after the revolution, only to be driven out of office by the extremists. Now, however, the whole country is covered by a net of enquiry created by the War Industrial Committee in its systematic effort to mobilize the resources of Russia. This speech was received with obvious interest and sympathy. The chairman then explained the various efforts made by our own people to mobilize our metal and mineral resources; he spoke of the many good citizens "milling around" Washington, of governmental machinery that was designed for tasks other than those of war; he asked his hearers to make allowances, to be tolerant of early errors; he asserted that the work was being done better every day, that it should be a matter of pride to the mining profession that the one committee in which the Institute was officially represented had done so well, namely, the War Minerals Committee. He called upon Mr. F. W. De Wolf, the State Geologist of Illinois and Assistant Director of the Bureau of Mines, who gave a summary of the various committees and councils organized for war preparations, explaining the correlation of Federal and State activities, and the gradual adjustment of relations between volunteer agencies and established bureaus, all tending unmistakably toward patriotic unity of purpose. A clearance of supernumerary groups was already apparent, he said, and the definite crystallization of policy out of a previously fluid condition. He spoke with deep seriousness and was heard with sustained interest. Mr. Moore, when introducing Mr. W. J. Westervelt, the chairman of the War Minerals Committee, laid emphasis on the fact that in the files of the members of the Institute there is recorded an accumulation of knowledge concerning mineral resources such as is obtainable nowhere else; he urged those present to volunteer whatever information they could, especially concerning the distribution and supply of the minerals most needed at this juncture. Mr. Westervelt explained how the American Association of State Geologists started the campaign for co-operation by organizing a committee on mineral imports and how subsequently the directors of both the Geological Survey and the Bureau of Mines were approached successfully, so that finally a larger committee was formed by the appointment of representatives from the State Geologists, the Survey, the Bureau of Mines, the Institute, and the Mining and Metallurgical Society, thus constituting what is now known as the War Minerals Committee. Mr. Westervelt described the scope of the work, he appealed for information, particularly concerning sources of pyrite and manganese. It was necessary to stimulate domestic production, in order to replace foreign supplies now shut off by shortage of shipping and other causes. He suggested a modification of the technique of sulphuric acid manufacture

so as to beneficiate deposits of pyrrhotite for the purpose. Then came Mr. David White, of the Geological Survey, an organization, as he said, possessing the largest body of information on American mineral resources. As part of the assistance given to the War Department he instanced the mapping of the Mexican frontier and the coastal regions. This mapping is proceeding at the rate of 100,000 square miles per month. A school for training topographic engineers has been organized and a detachment of them has been sent already to France. The engraving department of the Survey has reproduced countless charts for the Navy and the War Colleges, as well as others to be studied by the men in training for aviation. Engineers formerly engaged in foreign exploration have given the Government their unpublished maps for the use of the Allies. Data concerning water-supply near camps and exploration for the alloy-metals represent other branches of activity. Every effort is being made to obtain a domestic output of all classes of necessary minerals in order to release vessels for the carriage of food and munitions. Mr. A. G. White, of the Bureau of Mines, secretary of the War Minerals Committee, outlined the scope of the work outside the principal metals of industry; he referred to the fact that in 1916 we received 800,000 tons of manganese from Brazil, as against a domestic consumption of 900,000 tons, whereas in 1917 our own production of high-grade ore was only 80,000 tons. We received 1,225,000 tons of pyrite from Spain in 1916, as against only about 400,000 tons to be imported in 1917. The next speaker, Mr. W. O. Hotchkiss, the State Geologist of Wisconsin and secretary of the Association of State Geologists, was introduced as the one chiefly to be credited for starting the good work on War minerals. He said, "War is not an objective thing; it is my war and your war; if you realize that, you will furnish all the information that you have for the benefit of all of us in winning this war; we are tackling the biggest job we have ever undertaken; our enemy is utilizing all his resources; we are less organized than he—by patient plodding research he has built up a complete structure for waging a campaign meant to place us at the feet of an arrogant autocracy." This evoked loud applause. Mr. Hotchkiss proceeded to state that the Government will take a quarter of our lead production; the Navy department has advertised for paint in excess of 10% of our entire production of mercury. Each man has his responsibility to do his share. Let every engineer do so even before he is called upon. Mr. Moore, as chairman, closed the meeting in a few appropriate remarks and asked for the names of men ready to go to Washington on special service.

This is a sketchy outline of the proceedings at a meeting that will long be remembered by those privileged to be present. Throughout it was marked by sustained interest and keen enthusiasm. At later sessions of the War Minerals Committee a large mass of useful information was given and recorded for the benefit of those in authority at Washington. We believe that much of it

will prove of first-rate value. Beyond the mere collection of useful data there was evoked a feeling of patriotism and of national service that has done more than anything else in its history to justify the right of the Institute to speak for the profession.

## Economic Disturbance of Silver

The disappearance from view of the tremendous totals of commercial transactions through the balancing of one credit against another, until only a small fraction remains to be settled with actual money, leaves the public quite unprepared to think in the proportions of the trade-volume when expressed in terms of currency. Suddenly the country sees Government securities mounting into the billions, and these represent a measure of commodities absorbed for the purposes of War. The great buyer in this case is not like ordinary buyers; Uncle Sam, engaged as he now is in the property and life insurance business for his people, is a consumer only. In business the buyer stands in the position at one and the same time of consumer and producer; he assembles supplies and he again issues them, having served either to benefit them in passing through his hands, or, presumably, to benefit the public as a distributor. In either case there is an income and an outgo of commodities, the difference between these being a charge for services rendered. When Uncle Sam buys copper and steel and nitrate and toluol, or beans and corn and potatoes, the goods simply disappear. When goods go into the Quartermaster's department it is the same as when they enter the wage-earner's kitchen; they have reached the hands of the ultimate consumer. Therefore, just as the wage-earner pays in coin and bills for the necessities of life, so Uncle Sam must issue exchangeable currency for the things consumed in this vitally important insurance business in which he is now engaged. Having no material output to offer, the item becomes a debit acknowledgment from Uncle Sam to the producer that covers, not a balance, but the entire bulk of the goods taken. Hence, of necessity, the vast issues of Liberty Bonds stand as a promise to pay, not protected by a metallic reserve, but based on service rendered in protecting the national existence and on the hope of future peace and normal prosperity they are to promote. Thus we suddenly see a large part of the totals of trade massed before us in an aggregate of securities that soar into unbelievable and incomprehensible billions. For one thing, it is helping us to appreciate the magnitude of trade and the immensity of the interests that we have to protect. On the other hand, timid men are beginning to worry about the volume of metallic currency available, and a clever manipulation of the silver market, based upon a real augmentation of the demand both here and abroad, which forced the price more than 100% above the level of a year ago, awoke the slumbering ogre of bi-metallism to again disturb the foundations of exchange. It is fortunate for the financial sanity of the world that the quotations fell as soon

as they did. Primarily our sympathies are with the metal-producer. It is to his interests that we are devoted; but it is not to the advantage of any silver miner to have his output so misused as to unsettle national credits by adding the strain of an uncertain medium of redemption, in consequence of which he would have to buy his supplies with a depreciated currency. As a fact, we suppose that the cost of producing silver has grown so that a doubling of its former value in terms of gold would represent an increase no more unwarrantable than the enhanced market value of the other metals. At 83 cents we believe the silver-producer is proportionately underpaid, and we would not be surprised to see another upward movement of the market.

To the bi-metallists, who so promptly appeared with their old fallacy, which the people of this country once rebuked with such unmistakable emphasis, it should be pointed out that if all the silver of Potosí and Cerro de Pasco once more could be collected into a national treasury, it would but feebly suffice to guarantee the national issues that would be needed to care for a credit-balance involving almost the total volume of the original credit. We must, then, if we can, think in terms of commodities, and recognize the dollar, whatever its substance, as but a token after all, assumed as a convenient evidence of an obligation to deliver merchandise and service. The commodities of the nation, and the labor of the people in producing them, are at the command of the Government. It must have them, and will have them; but the hardship upon the people will not be lessened by complicating the problem of ultimate liquidation through disturbing the monetary standard by adding the variables inherent in the value of silver to the lesser variables that exist in the purchasing power of gold.

Recently Prof. Irving Fisher has been quarreling with the gold standard, and fundamentally he is correct in saying that the true measure of exchangeable value is a unit derived from a commodity-index number. That is what money is always meant to accomplish; it represents a token of materials and services delivered in trade. Men have fixed upon gold because it is beautiful, heavy, extraordinarily indestructible, and because it has never been found in quantities that would admit of its general use as an article of utility on an important scale. The family plate is made of silver and not of gold—for a reason that does not depend upon the whims of governments and financiers, but upon the fact that there is enough silver available to go round, and to increase the brilliancy and joys of weddings for a long time to come. It has been said that rising prices meant a superabundance of gold, but this fails to explain the abnormal conditions that had developed even before the War, when foods rose in value for a decade while the scale of metal-prices continued almost unchanged. It is certain that a deluge of gold would produce the effect of depreciation of its purchasing power, but we are in no danger of discovering another Rand and Klondike over-night. Silver,
